The myriapoda are divided into two orders: the lower, *Chilognatha* (*Julus*, etc.), having the body sub-cylindrical, the feet very numerous, the head rounded, the mandibles thick and strong; the higher *Chilopoda* (*Scolopendra*, etc.), having the body flattened, the feet comparatively few, the head broad, the mandibles sharp and curved.

The myriapoda are found in all parts of the world, in the ground, among moss, under stones, in the decaying bark of trees, in decaying roots, and in many similar situations. The largest species are tropical. They are all generally regarded with aversion. It is doubtful how far any of them are injurious to crops, although it is not improbable that they accelerate rottenness already begun; but some (Centipedes) have a venomous and painful bite.

MYRI'CA. See CANDLEBERRY.

MYRISTICACEÆ. See NUTMEG.

MYRIS'TIC ACID ($C_{28}H_{27}O_3,HO$) is a crystalline fatty acid, found in the seeds of the common nutmeg, *Myristica moschata*. It occurs in the form of a glyceride in the fat of the nutmeg, or nutmeg butter. It has recently been found in small quantity amongst the products of the saponification of spermaceti, and of the fatty matter of milk; and hence this organic acid must be ranked amongst those which are common both to the animal and vegetable kingdoms.

MYRMECO'BIUS, the banded ant-eater of Australia. See MARSUPIALIA.

MYRMECO'PHAGA. See ANT-EATER.

MYRME'LEON. See ANT LION, *ante*.

MYRMID'ONES, an ancient people in Pthiotis, in s. Thessaly. According to the legends, they were so called from Myrmidon, a son of Jupiter, and son-in-law of Æolus. Myrmidon's son, Actor, married Ægina, daughter of Asopus. Another story says they came from Ægina, and were ants (myrmêkes), changed by Jupiter into men. They settled in Thessaly with Peleus, with whose son Achilles, they went to the Trojan war. The name has come to denote, in English, a troop or great horde of ruffians devoted to a single leader.

MYROBALANS, the astringent fruit of certain species of *Terminalia*, of the natural order *Combretaceæ*, natives of the mountains of India. The genus *Terminalia* has a deciduous bell-shaped calyx and no corolla; the fruit is a juiceless drupe. *T. Belerica*, a species with alternate eliptical entire leaves, on long stalks, produces great part of the myrobalans of commerce; but the fruits of other species often appear under the same name. Tonic properties are ascribed to myrobalans; but although once in great repute, they are now scarcely used in medicine. They are used, however, by tanners and by dyers, and have therefore become a very considerable article of importation from India. They give a durable yellow color with alum, and, with the addition of iron, an excellent black.—*Emblic myrobalans* are the fruit of *Emblica officinalis*, of the natural order *Euphorbiaceæ*, a native of India. They are used in India as a tonic and astringent; also in tanning and in the making of ink.—There is a kind of plum called the *Myrobalan Plum*. See PLUM.

MY'RON, about B.C 480—430; native of Bœotia; Athenian sculptor and engraver of wood and silver; studied under Agelidas at Argos. His first great production was the statue of a cow, so wonderfully life-like that it was mistaken for the real animal by cattle Myron, as Pliny observes, excelled not in expression but in realistic imitation of men and animals. Perhaps his most noted work was the "Discobolus," or quoit-thrower. The bronze image of the cow stood in Athens for many centuries, and was then taken to Rome, where it was known to be as late as the sixth century. Several statues were discovered in the last century, which it was claimed were the work of Myron, and one or two are almost certainly original. The British museum has an ancient marble copy of the "Discobolus."

MYRRH (Heb. *mur*), a gum produced by *balsamodendron* (q.v.) *myrrha*, a tree of the natural order *amyridaceæ*, growing in Arabia, and probably also in Abyssinia. The myrrh tree is small and scrubby, spiny, with whitish-gray bark, thinly-scattered small leaves, consisting of three obovate obtusely toothletted leaflets, and the fruit a smooth brown ovate drupe, somewhat larger than a pea. Myrrh exudes from the bark in oily yellowish drops, which gradually thicken and finally become hard, the color at the same time becoming darker. Myrrh has been known and valued from the most ancient times; it is mentioned as an article of commerce in Gen. xxxvii. 25, and was amongst the presents which Jacob sent to the Egyptian ruler, and amongst those which the wise men from the east brought to the infant Jesus. It was an ingredient in the "holy anointing oil" of the Jews. Myrrh appears in commerce either in tears and grains, or in pieces of irregular form and various sizes, yellow, red, or reddish brown. It is brittle, and has a waxy fracture, often exhibiting whitish veins. Its smell is balsamic, its taste aromatic and bitter. It is used in medicine as a tonic and stimulant, in disorders of the digestive

organs, excessive secretions from the mucous membranes, etc., also to cleanse foul ulcers and promote their healing, and as a dentifrice, particularly in a spongy or ulcerated condition of the gums. It was much used by the ancient Egyptians in embalming. The best myrrh is known in commerce as *Turkey myrrh*, being brought from Turkish ports; as the name *East Indian myrrh* is also given to myrrh brought to Europe from the East Indies, although it is not produced there, but comes from Abyssinia. It is not yet certainly known whether the myrrh tree of Abyssinia is the same as that of Arabia, or an allied species.

MYRSINA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, natives of warm climates, and having simple leathery leaves, destitute of stipules; hermaphrodite or unisexual flowers, generally small, but often in umbels, corymbs, or panicles; very similar in structure to the flowers of the *primulaceæ;* the fruit generally fleshy, with 1 to 4 seeds. The flowers are very often marked with sunken dots or glandular lines.—There are more than 300 known species. Many of them are beautiful evergreen shrubs, particularly the genus *ardisia.* Some have peppery fruit, as *embelia ribes.*

MYRTA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, natives chiefly of warm, but partly also of temperate countries. The order, as defined by the greater number of botanists, includes several suborders, which are regarded by some as distinct orders, particularly CHAMÆLAUCIACEÆ (in which are contained about 50 known species, mostly beautiful little bushes, often with fragrant leaves, natives of New Holland), Barringtoniaceæ (q.v.), and Lecythidaceæ (q.v.). Even as restricted, by the separation of these, the order contains about 1300 known species. The leaves are entire, usually with pelucid dots, and a vein running parallel to and near their margin.—Some of the species are gigantic trees, as the *eucalypti* or *gum tree* of New Holland, and different species of *metrosideros*, of which one is found as far s. as Lord Auckland's islands, in lat. 50½°. The timber is generally compact.—Astringency seems to be rather a prevalent property in the order, and the leaves or other parts of some species are used in medicine as astringents and tonics. A fragrant or pungent volatile oil is often present in considerable quantity, of which *oil of cajeput* and *oil of cloves* are examples. *Cloves* and *pimento* are amongst the best known products of this order. The berries of several species are occasionally used as spices in the same way as the true pimento. A considerable number yield pleasant edible fruits, among which are the POMEGRANATE, the GUAVA, species of the genus *Eugenia*, and some species of myrtle.

MYRTLE, *Myrtus*, a genus of *myrtaceæ*, having the limb of the calyx 4 to 5 parted, 4 to 5 petals, numerous free stamens, an almost globose germen, and a 2 to 3 celled berry, crowned with the limb of the calyx, and containing kidney shaped seeds. The leaves are opposite and marked with pelucid dots; the flower-stalks are axillary, and generally one-flowered. The COMMON MYRTLE (*M. communis*) is well known as a beautiful evergreen shrub, or a tree of moderate size, with white flowers. It is a native of all the countries around the Mediterranean sea, and of the temperate parts of Asia, often forming thickets, which sometimes occur even within the reach of the sea-spray. The leaves are ovate or lanceolate, varying much in breadth. They are astringent and aromatic, containing a volatile oil, and were used in medicine by the ancients as a stimulant. The berries are also aromatic, and are used in medicine in Greece and India. A myrtle wine, called *myrtidanum*, is made in Tuscany. Myrtle bark is used for tanning in many parts of the south of Europe. Among the ancient Greeks the myrtle was sacred to Venus, as the symbol of youth and beauty, was much used in festivals, and was, as it still is, often mentioned in poetry. The myrtle endures the winters of Britain only in the mildest situations in the south.—The SMALL-LEAVED MYRTLE of Peru (*M. microphylla*) has red berries of the size of a pea, of a pleasant flavor and sugary sweetness. Those of the LUMA (*M. luma*) are also palatable, and are eaten in Chili; as are those of the DOWNY MYRTLE (*M. tomentosa*), on the Neilgherry hill; and those of the WHITE-BERRIED MYRTLE (*M. leucocarpa*), by some regarded as a variety of the common myrtle, in Greece and Syria. The berries of this species or variety are larger than those of the common myrtle, and have a very pleasant taste and smell.—A very humble species of myrtle (*M. nummullaria*) spreads over the ground in the Falkland islands, as thyme does in Britain.

MYRTLE-WAX. See WAX.

MY'SIA, in ancient geography, a province in n.w. Asia Minor, joining Lydia on the s. and Bithynia on the e., and bounded w. by the Hellespont and n. by the Propontis; the principal rivers were the Caicus, Æsepus, and Rhyndacus; the surface is mountainous in the interior, and in part table-land. The inhabitants were thought by some ancient writers to be of Thracian, and by others of Lydian descent; probably there were immigrations from both countries. Homer mentions the Mysi, but does not define their country. Mysia was subject to the Lydian monarchy, and under the Persian dominion formed, together with Lydia, one of the satrapies created by Darius. After the death of Alexander the Great, it passed from Macedonian to Syrian rule, was then given to the kings of Pergamus by Rome, and afterwards made a Roman province. Its principal towns were Abydos, Cyzicus, and Pergamus.

MY'SIS, a genus of podophthalmous (stalk-eyed) crustaceans, of the order *stomapoda*, much resembling the common shrimps in form, although differing from them in the external position of the gills. They are often called *opposum shrimps,* because the last two feet are furnished with an appendage, which in the female forms a large pouch, and in this the eggs are received after they leave the ovary, and are retained till the young acquire a form very similar to that of the parent, when the whole brood are at once set free into the ocean. Species of mysis are found on the British shores, but they are far more abundant in the Arctic seas, where they form no small part of the food of whales, and of many fishes, particularly of different species of salmon.

MYSORE', or MAISUR, a raji or principality of southern India, under the protection of the British government, in lat. 11° 35′ to 15° n., and in long. 74° 45′ to 78° 45′ east. It is bounded on the n. by the British collectorate of Dharwar, and otherwise surrounded by districts belonging to the Madras presidency. The area is 27,000 sq.m.; the population in 1881–82 was 4,186,199. Mysore is an extensive table-land, with an average elevation of about 2,000 ft., and with a slope principally towards the n. and n.e. The chief rivers are the Cauvery, flowing s.e., and the Tungabhadro, the Hugri, and the Pennar, flowing n. and n.e. The climate of the higher districts is during a great portion of the year healthy and pleasant. In 1871–72, the value of the exports, which consist of betel-nut, cotton, cardamons, rice, silk, and sugar, amounted to £1,100,000. The imports, consisting mainly of iron, gold, pepper, salt, and pulses, were £1,070,000. Since 1832 the control of the country has been entirely in the hands of the English, and the government is administered by a British commissioner. Chief town, Mysore. For the history of Mysore, see articles HYDER ALI, TIPPOO SAHIB, and INDIA.

MYSORE, or MAISUR, a city of India, the seat of a British residency, capital of the territory, and of the subdivision of the same name, is situated amid picturesque scenery on a declivity formed by two parallel ranges of elevated ground running n. and s., 245 m. w.s.w. of Madras, lat. 12° 19′ n., long. 76° 42′ east. The houses are generally built of teak, and among the chief edifices are the British residency and church. The fort is quadrangular in form, three of its sides being 450 yards in length, and the remaining side longer. The rajah's palace, occupying three sides of the interior fort, contains a magnificent chair or throne of gold. The climate is mild, but not healthy; fevers are of frequent occurrence. Carpets are manufactured. Pop. '80, 60,000.

MYSTAGOGUE (Gr. *mustes,* an initiated person, and *ago,* I lead), the name in the Greek religious system of the priest whose duty it was to direct the preparations of the candidates for initiation in the several mysteries, as well as to conduct the ceremonial of initiation. It was sometimes applied by a sort of analogy to the class of professional *ciceroni,* who in ancient, as still in modern times, undertook to show strangers newly arrived in a city the noteworthy objects which it contained; but the former meaning is its primitive one, and formed the ground of the application of the same name in the Christian church, to the catechists or other clergy who prepared candidates for the Christian *mysteries,* or sacraments, of baptism, of confirmation, and the eucharist, especially the last. In this sense the word is constantly used by the fathers of the 4th and 5th centuries; and in the well-known lectures of St. Cyril of Jerusalem, although all were addressed to candidates for the mysteries, some for baptism, and some for the eucharist, it is only the lectures addressed to the latter that the name *mystagogic* is applied. This distinction was connected with the well-known Discipline of the Secret; and it appears to have ceased with the abolition or gradual disuse of that discipline.

MYSTERIES (Gr. from *muo,* to close the lips or eyes), also called *Teletai, Orgia,* or, in Latin, *Initia,* designate certain rites and ceremonies in ancient, chiefly Greek and Roman, religions, only known to, and practiced by, congregations of certain initiated men and women, at appointed seasons, and in strict seclusion. The origin, as well as the real purport of these mysteries, which take no unimportant place among the religious festivals of the classical period, and which, in their ever-changing nature, designate various places of religious development in the antique world, is all but unknown. It does seem, indeed, as if the vague speculations of modern times on the subject were an echo of the manifold interpretations of the various acts of the mysteries given by the priests to the inquiring disciple—according to the lights of the former or the latter. Some investigators, themselves not entirely free from certain mystic influences (like Creuzer and others), have held them to have been a kind of misty orb around a kernel of pure light, the bright rays of which were too strong for the eyes of the multitude; that, in fact, they hid, under an outward garb of mummery, a certain portion of the real and eternal truth of religion, the knowledge of which had been derived from some primeval, or, perhaps, the Mosaic revelation; if it could not be traced to certain (or uncertain) Egyptian, Indian, or generally eastern sources. To this kind of hazy talk, however (which we only mention because it is still repeated every now and then), the real and thorough investigations begun by Lobeck, and still pursued by many competent scholars in our own day, have, or ought to have, put an end. There cannot be anything more alien to the whole spirit of Greek and Roman antiquity than a hiding of abstract truths and occult wisdom under rights and formulas, songs and dances; and, in fact, the mysteries were anything but exclusive, either with respect to sex, age, or rank, in point of initiation. It was only the speculative tendency of later times, when Poly-

theism was on the wane, that tried to symbolize and allegorize these obscure, and partly imported ceremonies, the bulk of which had undoubtedly sprung from the midst of the Pelasgian tribes themselves in prehistoric times, and which were intended to represent and to celebrate certain natural phenomena in the visible creation. There is certainly no reason to deny that some more refined minds may, at a very early period, have endeavored to impart a higher sense to these wondrous performances; but these can only be considered as solitary instances. The very fact of their having to be put down in later days as public nuisances in Rome herself, speaks volumes against the occult wisdom inculcated in secret assemblies of men and women.

The mysteries, as such, consisted of purifications, sacrificial offerings, processions, songs, dances, dramatic performances, and the like. The mystic formulas (*Deiknumena*, *Dromena*, *Legomena*, the latter including the Liturgies, etc.) were held deep secrets, and could only be communicated to those who had passed the last stage of preparation in the mystagogue's hand. The hold which the nightly secrecy of these meetings, together with their extraordinary worship, must naturally have taken upon minds more fresh and childlike than our advanced ages can boast of, was increased by all the mechanical contrivances of the effects of light and sound which the priests could command. Mysterious voices were heard singing, whispering, and sighing all around, lights gleamed in manifold colors from above and below, figures appeared and disappeared; the mimic, the tonic, the plastic—all the arts, in fact, were taxed to their very utmost to make these performances (the nearest approach to which, in this country, is furnished by transformation-scenes, or sensation-dramas in general) as attractive and profitable (to the priests) as could be. As far as we have any knowledge of the plots of these mysteries as scenic representations, they generally brought the stories of the special gods or goddesses before the spectator—their births, sufferings, deaths, and resurrections. Many were the outward symbols used, of which such as the Phallus, the Thyrsus, flower baskets, mystic boxes, in connection with special deities, told, more or less, their own tale, although the meanings supplied by later ages, from the Neo-platonists to our own day, are various, and often very amazing. The most important mysteries were, in historical times, those of Eleusis and the Thesmophorian, both representing—each from a different point of view—the rape of Proserpina, and Cere's search for her: the Thesmophorian mysteries being also in a manner connected with the Dionysian worship. There were further, those of Zeus of Crete—derived from a very remote period—of Bacchus himself, of Cybele, and Aphrodite—the two latter with reference to the mystery of propagation, but celebrated in diametrically opposed ways, the former culminating in the self-mutilation of the worshiper, the latter in prostitution. Further, the mysteries of Orpheus, who, in a certain degree, was considered the founder of all mysteries. Nor were the other gods and goddesses forgotten: Hera, Minerva, Diana, Hecate, nay, foreign gods like Mithras (q.v.), and the like, had their due secret solemnities all over the classical soil, and whithersoever Greek (and partly Roman) colonists took their Lares and Penates all over the antique world. The beginning of the reaction in the minds of thinking men, against this mostly gross and degenerated kind of veneration of natural powers and instincts, is marked by the period of the Hesiodic poems; and when, toward the end of the classical periods, the mysteries were no longer secret, but public orgies of the most shameless kind, their days were numbered. The most subtle metaphysicians, allegorize and symbolize as they might, failed in reviving them, and in restoring them to whatever primeval dignity there might have once been inherent in them.

MYSTERIES AND **MIRACLE-PLAYS** were dramas founded on the historical parts of the Old and New Testaments, and the lives of the saints, performed during the middle ages, first in churches, and afterwards in the streets on fixed or movable stages. Mysteries were properly taken from biblical and miracle-plays from legendary subjects, but this distinction in nomenclature was not always strictly adhered to. We have an extant specimen of the religious play of a date prior to the beginning of the middle ages in the *Christos Paschōn*, assigned, somewhat questionably, to Gregory Nazianzen, and written in 4th c. Greek. Next comes six Latin plays on subjects connected with the lives of the saints, by Roswitha, a nun of Gandersheim, in Saxony, which, though not very artistically constructed, possesses considerable dramatic power and interest; they have been lately published at Paris, with a French translation. The performers were at first the clergy and choristers, afterwards any layman might participate. The earliest recorded performance of a miracle-play took place in England. Matthew Paris relates that Geoffroy, afterwards abbot of St. Albans, while a secular, exhibited at Dunstable the miracle-play of *St. Catherine*, and borrowed copes from St. Albans to dress his characters. This must have been at the end of the 11th or beginning of the 12th century. Fitzstephen, in his *Life of Thomas à Becket*, 1183 A.D , describes with approval the representation in London of the sufferings of the saints and miracles of the confessors. On the establishment of the Corpus Christi festival by Pope Urban IV. in 1264, miracle-plays became one of its adjuncts, and every considerable town had a fraternity for their performance. Throughout the 15th and following centuries, they continued in full force in England, and are mentioned, sometimes approvingly, sometimes disapprovingly, by contemporary writers. Designed at first as a means of religious instruction for the people, they had long before the reformation so far departed from their original character, as to

be mixed up in many instances with buffoonery and irreverence, intentional or unintentional, and to be the means of inducing contempt rather than respect for the church and religion. Remarkable collections exist of English mysteries and miracles of the 15th c., known as the Chester, the Coventry, and the Townley plays. The first two have been published by the Shakespeare Society, and the other by the Surtees Society. The Townley mysteries are full of the burlesque element, and contain many curious illustrations of contemporary manners.

Out of the mysteries and miracle-plays sprang a third class of religious plays called *Moralities*, in which allegorical personification of the Virtues and Vices were introduced as *dramatis personæ*. These personages at first only took part in the play along with the scriptural or legendary characters, but afterwards entirely superseded them. The oldest known English compositions of this kind are of the time of Henry VI.; they are mere elaborate and less interesting than the miracle-plays. Moralities continued in fashion till the time of Elizabeth, and were the immediate precursors of the regular drama.

Miracles and mysteries were as popoular in France, Germany, Spain, and Italy as in England. A piece of the kind yet extant, composed in France in the 11th c., is entitled the *Mystery of the Wise and Foolish Virgins*, and written partly in the Provençal dialect and partly in Latin. A celebrated fraternity, called the Confrérie de la Passion, founded in Paris in 1350, had a monopoly for the performance of mysteries and miracle-plays, which were of such a length, that the exhibition of each occupied several days. A large number of French mysteries of the the 14th c. are extant. In the alpine districts of Germany, miracle-plays were composed and acted by the peasants; these peasant-plays had less regularity in their dramatic form, were often interspersed with songs and processions; and in their union of simplicity with high-wrought feeling were most characteristic of a people in whom the religious and dramatic element are both so largely developed. In the early part of the last century, they began to partake to a limited extent of the burlesque, which had brought the miracle-plays into disrepute elsewhere.

It is a mistake to suppose that the hostility of the reformers was what suppressed these exhibitions. The fathers of the reformation showed no unfriendly feeling towards them. Luther is reported to have said that they often did more good and produced more impression than sermons. The most direct encouragement was given to them by the founders of the Swedish Protestant Church, and by the earlier Lutheran bishops, Swedish and Danish. The authorship of one drama of the kind is assigned to Grotius. In England the greatest check they received was from the rise of the secular drama; yet they continued to be occasionally performed in the times of James I. and Charles I., and it is well known that the first sketch of Milton's *Paradise Lost* was a sacred drama, where the opening speech was Satan's Address to the Sun. A degenerate relic of the miracle-play may yet be traced in some remote districts of England, where the story of St. George, the dragon, and Beelzebub, is rudely represented by the peasantry. Strange to say, it was in the Catholic south of Germany, where these miracle-plays and mysteries had preserved most of their old religious character, that the severest blow was levelled against them. Even there, they had begun to be tainted to a limited extent with the burlesque element, which had brought them into disrepute elsewhere. In 1779 a manifesto was issued by the prince-archbishop of Salzburg, condemning them, and prohibiting their performance, on the ground of their ludicrous mixture of the sacred and the profane, the frequent bad acting in the serious parts, the distraction of the lower orders from more edifying modes of instruction, and the scandal arising from the exposure of sacred subjects to the ridicule of freethinkers. This ecclesiastical deununciation was followed by vigorous measures on the part of the civil authorities in Austria and Bavaria. One exception was made to the general suppression. In 1633 the villagers of Oberammergau, in the Bavarian highlands, on the cessation of a plague which desolated the surrounding country, had vowed to perform every tenth year the Passion of Our Savior, out of gratitude, and as a means of religious instruction; a vow which had ever since been regularly observed. The pleading of a deputation of Ammergau peasants with Max. Joseph of Bavaria saved their mystery from the general condemnation, on condition of everything that could offend good taste being expunged. It was then and afterwards somewhat remodelled, and is perhaps the only mystery or miracle-play which has survived to the present day. The last performance took place in 1870. The inhabitants of this secluded village, long noted for their skill in carving in wood and ivory, have a rare union of artistic cultivation with perfect simplicity. Their familiarity with sacred subjects is even beyond what is usual in the alpine part of Germany, and the spectacle seems still to be looked on with feelings much like those with which it was originally conceived. What would elsewhere appear impious, is to the alpine peasants devout and edifying. The personator of Christ considers his part an act of religious worship; he and the other principal performers are said to be selected for their holy life, and consecrated to their work with prayer. The players, about 500 in number, are exclusively the villagers, who, though they have no artistic instruction, except from the parish priest, act their parts with no little dramatic power, and a delicate appreciation of character. The New Testament narrative is strictly adhered to, the only legendary addition to it being the St. Veronica handkerchief. The acts alternate with *tableaux* from the Old Testament and choral odes. Many thousands of the peasantry are attracted by the spectacle from all parts of the Tyrol and Bavaria, among whom the same earnest and devout demeanor

prevails as among the performers. Plays of a humbler description, from subjects in legendary or sacred history, are not unfrequently got up by the villagers around Insbruck, which show a certain rude dramatic talent, though not comparable to what is exhibited at Ammergau. Girls very generally represent both the male and female characters.

MYSTICETE, a name of the whalebone whale, a cetacean of the family *balænidæ*, or toothless whales, see WHALE and CETACEA, *ante*.

MYS'TICISM (Gr. *mustikos*, mystical), a term used with considerable vagueness, but implying that general tendency in religin to higher and more intimate communication with the divine, to which, in most religions, ancient and modern, certain individuals or classes have laid claim. In the Platonic philosophy, and in the eastern systems, from which that philosophy is derived, the human soul being regarded as a portion of the divine nature, it is held to be the great end of life to free the soul from the embarrassment and mental darkness in which it is held by the material trammels of the body in which it is imprisoned. In the pursuit of this end, two very opposite courses were adopted: the first, that of spiritual purification, partly by representing the natural appetites and weakening the sensual impulses by corporeal austerities, partly by elevating the soul through intense contemplation and withdrawal from the outward objects of sense; the other, that of regarding the soul as superior to the body, independent of its animal impulses, incapable, from its higher origin, of being affected by its outward actions, or sullied by contact with the corruption in which its lower nature might love to wallow. A similar element of mysticism, which, in truth, must form in some sense a constituent of every religious system, is traceable in the early doctrinal history of Christianity, and the career of Christian mysticism also divides itself into the same twofold course. Among the early sects external to the church, we trace the first in the system of Tatian and of the Eucratites, while the second finds its parallel in the Syrian gnostics, in Carpocrates, Bardisanes, and in one form at least of the Nicolaitic heresy. Within the Christian church there never has been wanting a continuous manifestation of the mystical element. The language of St. Paul in Gal. ii. 20, and in 2d Cor. xii. 2, and many expressions in the Apocalypse, may be taken as the exponents of Christian mysticism, the highest aspiration of which has ever been toward that state in which the Christian "no longer liveth, but Christ liveth in him." And although no regular scheme of mysticism can be found in the early fathers, yet the writings of Hermas the shepherd, the epistles of St. Ignatius, the works of St. Clement of Alexandria, the expositions of Origen, and above all, the confessions of St. Augustine, abound with outpourings of the true spirit of Christian mysticism. It is curious that the first systematic exposition of its principles is said to be in the works of the pseudo-Dionysius the Areopagite; but it was not till the days of the Scholastics that it received its first development, when the mystic life was resolved into its three stages, viz., of purification, of illumination, and of ecstatic union with God and absorption in divine contemplation. It was upon the explanation of this third stage that the great division of the medieval mystic schools mainly turned; some of them explaining the union with God in a pantheistic or semi-pantheistic sense, and thereby annihilating the individual will, and almost the personal action of man in the state of ecstasy; others, with St. Bernard, fully preserving both the individuality and the freedom of man, even in the highest spiritual communication with his Creator. Of the former, many, as the Hesychasts (q.v.) in the Greek church, and the brethren of the free spirit (q.v.) and the Beghards in the Latin, drew from these mystical doctrines the most revolting moral consequences; in others, as Tauler, Ruysbroek, Ekkart, the error does not seem to have gone beyond the sphere of speculation. The writings of Thomas à Kempis (q.v.), of St. Catherine of Siena, of St. John of the cross, and of St. Teresa, may perhaps be taken as the most characteristic representations of the more modern form of the traditionary mysticism which has come down from the mystics of the middle ages.

The later history of mysticism in the Roman Catholic church will be found under the heads of FENELON, MADAME GUYON, MOLINOS, and QUIETISM. The most remarkable followers of the same or kindred doctrines in the Protestant communions are Jacob Böhme (q.v.) of Görlith, Emmanuel Swedenborg (q.v.), and the celebrated William Law (q.v.)

MYTH and **MYTH'OLOGY**. The word *myth* (Gr. *mythos*) originally signified *speech* or *discourse*, and was identical with the word *logos*. After the age of Pindar and Herodotus, however, it came to be synonymous with the Latin word *fabula*, *fable* or *legend*. According to the present use of our language, a myth is an idea or fancy presented in the historical form; and though, of course, any fiction at any time in this shape might be called a myth, yet by usage the word is confined to those fictions made in the early periods of a people's existence, for the purpose of presenting their religious belief, and generally their oldest traditions, in an attractive form. The tendency to create myths in this way seems inherent in every people; certainly there is no people so sunk into the brute as to be without them. A myth is not to be confounded with an allegory; the one being an unconscious act of the public mind at an early stage of society, the other a conscious act of the individual mind at any stage of social progress. The parables of the New Testament are allegorical; so are Æsop's fables; no one mistakes them for realities;

MYTHOLOGY.—1. Rhea. 2. Saturn. 3. Cybele. 4. Jupiter. 5. Juno. 6. Neptune. 7. Vesta. 8. Pluto. 9. Ceres. 10. Bacchus. 11. Minerva. 12. Apollo. 13. Diana. 14. Mars. 15. Venus. 16. Amor. 17. Mercury. 18. Vulcan. 19. Esculapius. 20. Hygeia. 21. Vertumnus. 22. Melpomene. 23. Erato. 24. Thalia. 25. Ganymede. 26. Bacchante. 27. Silenus. 28. Procession of Bacchus. 29. Tritons and Nereides.

they are known to have been invented for a special didactic purpose, and so received. But the peculiarity of myths is, that they are not only conceived in the narrative form, but generally taken for real narrations by the people to whom they belong, so long as they do not pass a certain stage of intellectual culture. Even myths of which the allegorical significance is pretty plain, such as the well-known Greek myth of Promethus and Epimetheus, were received as facts of early tradition by the Greeks. Myths may be divided into several classes, of which the first and most important is the theological and moral. The oldest theology of all nations is in the form of myths; hence the great importance of mythological study, now universally recognized; for it is not occupied merely or mainly with strange fancies and marvelous fictions, invented for the sake of amusement, but contains the fundamental ideas belonging to the moral and religious nature of man as they have been embodied by the imaginative faculty of the most favored races. It is this dominance of the imagination, so characteristic of the early stages of society, which gives to myth its peculiar dramatic expression, and stamps the popular creed of all nations with the character of a poetry of nature, of man, and of God. From the very nature of the case, the myth-producing faculty exercises itself with exuberance only under the polytheistic form of religion; for there only does a sufficient number of celestial personages exist, whose attributes and actions may be exhibited in a narrative form; there is nothing, however, to prevent even a monotheistic people from exhibiting certain great ideas of their faith in a narrative form, so as by prosaic minds to be taken for literal historical facts. But besides strictly theological myths, there are physical myths, that is, fictions representing the most striking appearances and changes of external nature in the form of political history; in which view, the connection of legends about giants, chimeras, etc., with regions marked by peculiar volcanic phenomena, has been often remarked. It is difficult indeed, in polytheistic religion, to draw any strict line between physical and theological myths; as the divinity of all the operations of nature is the first postulate of polytheism, and every physical phenomenon becomes the manifestation of a god. Again, though it may appear a contradiction, there are historical myths, that is, marvelous legends about persons, who may with probability be supposed to have actually existed. So intermingled, indeed, is fact with fable in early times, that there must always be a kind of debatable land between plain theological myth and recognized historical fact. This land is occupied by what are called the heroic myths; that is, legends about heroes, concerning whom it may often be doubtful whether they are merely a sort of inferior, and more human-like gods, or only men of more than ordinary powers whom the popular imagination has elevated into demi-gods.

The scientific study of mythology commenced with the ancient nations who produced it, specially with the acute and speculative Greeks. The great mass of the Greek people, indeed—of whom we have a characteristic type in the traveler Pausanias—accepted their oldest legends, in the mass, as divine and human facts; but so early as the time of Euripides, or even before his day in the case of the Sicilians, Epicharmus and Empedocles, we find that philosophers and poets had begun to identify Jove with the upper sky, Apollo with the sun, Juno with the nether atmosphere, and so forth; that is, they interpreted their mythology as a theology and poetry of nature. This, indeed, may be regarded as the prevalent view among all the more reflective and philosophical heathens (who were not, like Xenophon, orthodox believers) up from the age of Pericles, 450 B.C., to the establishment of Christianity. But there was an altogether opposite view, which arose at a later period, under less genial circumstances, and exercised no small influence both on Greek and Roman writers. This view was first prominently put forth by Euhemerus, Messenian, in the time of the first Ptolemies, and consisted in the flat prosaic assertion, that the gods, equally with the heroes, were originally men, and all the tales about them only human facts sublimed and elevated by the imagination of pious devotees. This view seemed to derive strong support from the known stories about the birth and death of the gods, specially of Jove in Crete; and the growing skeptical tendencies of the scientific school at Alexandria, were of course favorable to the promulgation of such views. The work of Euhemerus accordingly obtained a wide circulation; and having been translated into Latin, went to nourish that crass form of religious skepticism which was one of the most notable symptoms of the decline of Roman genius at the time of the emperors. Historians, like Diodorus, gladly adopted an interpretation of the popular mythology which promised to swell their stores of reliable material; the myths accordingly were coolly emptied of the poetic soul which inspired them, and the early traditions of the heroic ages were set forth as plain history, with a grave sobriety equally opposed to sound criticism, natural piety, and good taste.

In modern times, the Greek mythology has again formed the basis of much speculation on the character of myths and the general laws of mythical interpretation. The first tendency of modern Christian scholars, following the track long before taken by the fathers, was to refer all Greek mythology to a corruption of Old Testament doctrine and history. Of this system of interpreting myths, we have examples in Vossius, in the learned and fanciful works of Bryant and Faber, and very recently, though with more pious and poetic feeling, in Gladstone. But the Germans, who have taken the lead here, as in other regions of combined research and speculation, have long ago given up this ground as untenable, and have introduced the rational method of interpreting every system of myths, in the first place, according to the peculiar laws traceable in its own

genius and growth. Ground was broken in this department by Heyne, whose views have been tested, corrected, and enlarged by a great number of learned, ingenious, and philosophical writers among his own countrymen, specially by Buttmann, Voss, Creuzer, Müller, Welcker, Gerhard, and Preller. The general tendency of the Germans is to start—as Wordsworth does in his *Excursion*, book iv.—from the position of a devout imaginative contemplation of nature, in which the myths originated, and to trace the working out of those ideas, in different places and at different times, with the most critical research, and the most vivid reconstruction. If in this work they have given birth to a large mass of ingenious nonsense and brilliant guess-work, there has not been wanting among them abundance of sober judgment and sound sense to counteract such extravagances. It may be noticed, however, as characteristic of their over speculative intellect, that they have a tendency to bring the sway of theological and physical symbols down into a region of what appears to be plain historical fact; so that Achilles becomes a water-god, Peleus a mud-god, and the whole of the *Iliad*, according to Forchhammer, a poetical geology of Thessaly and the Troad! Going to the opposite extreme from Euhemerus, they have denied the existence even of deified heroes; all the heroes of Greek tradition, according to Uschold, are only degraded gods; and generally in German writers, a preference of transcendental to simple and obvious explanations of myths is noticeable. Creuzer, some of whose views had been anticipated by Blackwell, in Scotland, is especially remarkable for the high ground of religious and philosophical conception on which he has placed the interpretation of myths; and he was also the first who directed attention to the oriental element in Greek mythology—not, indeed, with sufficient discrimination in many cases, but to the great enrichment of mythological material, and the enlargement of philosophical survey. In the most recent times, by uniting the excursive method of Creuzer with the correction supplied by the more critical method of O. Müller and his successors, the science of comparative mythology has been launched into existence; and specially the comparison of the earliest Greek mythology with the sacred legends of the Hindus, has been ably advocated by Max Müller in the *Oxford Essays* (1856). In France, the views of Euhemerus were propounded by Banier (1739). By the British scholars, mythology is a field that has been very scantily cultivated. Besides those already named, Payne Knight, Mackay, Grote in the first volumes of his history, and Keightley are the only names of any note, and their works can in nowise compete in originality, extent of research, in discriminating criticism, or in largeness of view, with the productions of the German school. The best for common purposes is Keightley; the most original, Payne Knight. Recently, G. W. Cox, in a work on Aryan mythology, has pushed the sanscritising tendencies of Max Müller to an extreme which to most minds seems absurd. On the special mythologies of India, Rome, Greece, etc., information will be found under the heads of the respective countries to which they belong. The more important mythological personages are noticed under their own names; see BACCHUS, JUPITER, HERCULES, etc.

MYTILE'NE, or MITYLENE, CITY. See CASTRO. *ante.*

MYTILE'NE, or MITYLENE, ISLAND. See LESBOS. *ante.*

MYTILI'DÆ. See MUSSEL, *ante.*

MYXINE, a genus of cartilaginous fishes, synonomous with the *gastro-branchus* of Bloch, of which the *myxine glutinosa* or glutinous hag is the type. See HAG, *ante.*

MYZONTS. See MYXINOIDS.

N

N, THE fourteenth letter of the English alphabet is one of the nasal liquids of the lingual class. See LETTERS. Its Hebrew (and Phenician) name, *Nun*, signified a *fish*, which its original form was probably meant to represent. N is interchangeable with L (q.v.) and M, as in *col*lect, *com*mingle, *con*fer; and in Ger. *boden*, compared with Eng. *bottom*. In Latin, this letter had a faint, uncertain sound at the end of words and in some other positions, especially before *s*. This accounts for words *on* having lost the *n* in the nominative case, though retaining it in the oblique cases, as *homo*, *hominis;* and for Greek names like *Platon* being written without the final *n* in Latin. The dull, muffled pronunciation of *n*, which is indicated by such words as *consul*, *censor*, *testamento*, being frequently spelled *cosul*, *cesor*, *testameto*, was the first stage of the modern French nasal *n*.. Before a guttural letter, *n* naturally assumes the sound of *ng*, as *bank*.

NABIS, d. 192 B.C., b. Sparta; usurped the throne of Lacedæmon on the death of king Machanidas, in 207. He put to death the son of the late king Lycurgus, and by threats or torture exacted large sums of money from the rich. He was thus able to raise a considerable army, with which he endeavored to capture the city of Messene. Philopœmen, the commander of the forces of Megalopolis, repulsed him, but the next year Nabis gained the advantage over the Megalopolitans. It seems to have been the design of Nabis to restore the Spartan hegemony in the Peloponnesus, but in 195, he was forced

to make peace with the Romans, whose army under Flaminius had besieged Sparta. In 192, being at war with the Achaians, he asked aid from the Ætolians, who furnished him with a small contingent, really for the purpose of destroying him; and their general Alexamenes speedily assassinated him.

NAAS, a market and assize t. of Kildare co., Ireland, 20½ m. s.w. of Dublin, and, next to Athy, the largest town in the county. The population in 1881 was 3,808. The principal street is about half a mile in length; the county court-house is in the main street. Having been anciently the seat of the kings of Leinster, Naas was early occupied by the English. A parliament was held in it in 1419, and it obtained charters successively from Henry V., Elizabeth and James I. At present, Naas is a place of little trade, and is almost entirely without manufactures. It returned two members to the Irish parliament. but was disfranchised at the Union. It is the seat of a diocesan school, and of three national schools, one of which is attached to the Roman Catholic convent. A newspaper, printed at Maryborough, is also published here.

NABLUS. See NABULUS, *ante.*

NA'BOB, or NABAB, a corruption of the word *nawâb* (deputy), was the title belonging to the administrators, under the Mogul empire, of the separate provinces into which the district of a *subahdar* (q.v.) was divided. The title was continued under the British rule, but it gradually came to be applied generally to natives who were men of wealth and consideration. In Europe, and especially in Britain, it is applied derisively to those who, having made great fortunes in the Indies, return to their native country, where they live in oriental splendor.

NABONAS'SAR, ERA OF, was the starting-point of Babylonian chronology, and was adopted by the Greeks of Alexandria, Berosus and others. It began with the accession of Nabonassar to the throne—an event calculated (from certain astronomical phenomena recorded by Ptolemy) to have taken place Feb. 26, 747 B.C.

NABULUS', or NABLUS' (a corruption of the Gr. *Neapolis,* New City, the name given to it in the reign of Vespasian), anciently called SHECHEM or SICHEN, in the New Testament (John iv. 5), SYCHAR; is a t. of Palestine, possessing, it is said, "the only beautiful site from Dan to Beersheba." It lies between mount Ebal and mount Gerizim, on the s. side of the valley of Erd-Mûkhna, and has a population variously estimated at from 8,000 to 14,000 of whom about 500 are Christians, 150 Samaritans, and 50 Jews; the rest are Mohammedans, fierce, turbulent, and fanatical. The houses are pretty good, but the streets (as usual in the East) are narrow, gloomy, and filthy. The chief productions are soap, cotton, and oil—the soap manufactories are large, and the oil is considered the best in Syria.—See Porter's *Handbook for Syria and Palestine,* and Stanley's *Palestine.*

NACHTIGAL, GUSTAV, b. Germany, 1834; studied medicine, which he practiced in Algeria, 1859–63. He then became a physician in the military service of the bey of Tunis, who soon made him his private medical adviser. In 1869 he started for Kuka, joining a caravan which was dispatched to carry from the king of Prussia to the sheikh of Bornoo, some gifts in recognition of his services to various German explorers. After a journey in the Tiboo country, he set out for Kuka, where he arrived in 1870. He made a thorough exploration of Bornoo, from which he went on several exploring expeditions. He went to lake Tchad, and collected a large store of materials in regard to the geography of the s. districts of Sahara. Making his way to Baghirmi, he followed up the Shai river and its tributaries. In the spring of 1878, he set out for Egypt, going s. of lake Tchad, through Waday which he was the first European to penetrate. He visited Abeshr, the capital of Waday, passed through the kingdom of Darfoor, and arrived at Cairo, Nov., 1874. An account of his explorations is given in his *Die Tributären Heidenländer Baghirmis.* He was president, Berlin Geog. Soc. He d. 1885.

NACOGDO'CHES, a co. in e. Texas, bounded on the e. by Attoyac river, and on the s.w. by the Angelina river; 900 sq.m.; pop. '80, 11,592–11,511 American birth, 3,040 colored. The surface is undulating and hilly, and much of it covered with a thick growth of forests. The soil is generally fertile, and particularly adapted to raising corn and cotton. Other productions are sweet potatoes, barley, and sorghum molasses. Co. seat, Nacogdoches.

NACRE. See MOTHER OF PEARL.

NA'DAL, BERNHARD H., D.D., LL.D., 1812–70; b. Maryland; admitted as a preacher in the Methodist Episcopal church by the old Baltimore conference in 1835. He was the pastor of 15 churches in different states n. and south. While a pastor he was a diligent student, and when stationed at Carlisle in 1848 he graduated at Dickenson college, pursuing his studies in connection with his pastoral work. He also taught a class in college. In 1849 he supplied the pulpit of an Independent church in Baltimore. In 1854–57 he was professor in the Indiana Asbury university. In 1857, returning to the Baltimore conference, he was made presiding elder of the Roanoke district in Virginia. During the slavery agitation at this time he vigorously defended his church and conference. In sermons and addresses he earnestly espoused and aided the cause of the national government in the war of the rebellion, and enjoyed the friendship of president Lincoln. In 1869 he became professor of historical theology in Drew seminary at Madi-

son, N. J., and after the death of Dr. McClintock was acting president, but was soon removed by death. He was an able preacher, a vigorous and polished writer, and contributed largely to periodicals. He was one of the editors of the *Methodist*, of whom Dr. Crooks said that "in writing he was almost without a peer in the American Methodist church." He was a thorough scholar and highly esteemed as an instructor.

NA'DIR, an Arabic word signifying that point in the heavens which is diametrically opposite to the zenith, so that the zenith, nadir, and center of the earth are in one straight line. The zenith and nadir form the poles of the horizon (q.v.). See ZENITH.

NADIR SHAH, of Persia, belonged to the Afshars, a Turkish tribe, and was born near Kelat, in the center of Khorassan, Persia, in 1688. When 17 years old, he was taken prisoner by the Usbeks, but escaped after four years of captivity; entered the service of the governor of Khorassan, and soon obtained high promotion. Having, however, been degraded and punished for some real or supposed offense, he betook himself to a lawless life, and for several years was the daring leader of a band of 3,000 robbers, who levied contributions from almost the whole of Khorassan. An opportunity having occurred, Nadir seized the town of Kelat, and gradually extended his territorial authority. Persia was at this time ruled by Melek Ashraf, an Afghan of the tribe of Ghilji, whose grinding tyranny and cruelty produced in the mind of every Persian a deadly hatred of the very name Afghan, which exists to the present day. Nadir having avowed his intention of expelling the hated race from the country, and restoring the Suffavean dynasty, numbers flocked to his standard, and Meshed, Herat, and all Khorassan were speedily reduced. Ashraf, signally defeated in several engagements, fled before the avenger, who, with a celerity only equaled by its thoroughness, purged the provinces of Irak, Fars, and Kerman of even the semblance of Afghan domination. The assassination of Ashraf, during his retreat, terminated the war. The rightful heir, Tamasp, then ascended the throne, and Nadir received for his services the government of the provinces of Khorassan, Mazanderan, Seistan, and Kerman, assuming at the same time the title of Tamasp-kûli (the slave of Tamasp), the title of khan being subsequently added. He was sent against the Turks in 1731, and defeated them at Hamadan, regaining the Armenian provinces which had been seized by the Turks in the preceding reign; but his sovereign having in his absence engaged unsuccessfully the same enemy, Nadir caused him to be put in prison, and elevated his infant son, Abbas III., to the throne in 1732. The death of this puppet, in 1736, opened the way for the elevation of Nadir himself, who was crowned as Nadir shah, Feb. 26, 1736. He resumed the war with the Turks; and though totally defeated in the first two battles by the grand vizier Asman, turned the tide of fortune in the subsequent campaign, and granted peace to the Turks on condition of receiving Georgia. He also conquered Afghanistan, and drove back the invading Usbeks. His ambassador to the Great Mogul having been murdered along with his suite at Jelalabad, and satisfaction having been refused, Nadir, in revenge, ravaged the Northwest Provinces, and took Delhi, which he was, by the insane behavior of the inhabitants, reduced to the necessity of pillaging. With booty to the amount of £20,000,000, including the Koh-i-nûr (q.v.) diamond, he returned to the w. bank of the Indus. He next reduced Bokhara and Khaurezm, restoring to Persia her limits under the golden reign of the Sassanides. From this period, his character underwent a sudden change; he was formerly open-hearted, liberal, and tolerant; he now became suspicious, avaricious, and tyrannical. The empire groaned under his extortions, and he was finally assassinated on June 20, 1747. His only surviving son was carried to Constantinople, and thence to Vienna, where he was brought up as a Catholic under the surveillance of the empress Maria Theresa, and died a maj. in the Austrian service, under the title of baron Semlin. Nadir's tyranny has now been forgotten; and at the present day he is regarded with pride and gratitude as the "Wallace" of Persia.

NÆ'VIUS, CN., one of the earliest Latin poets, was born, probably in Campania, in the first half of the 3d c. B.C. In his youth, he served in the first Punic war; but about the year 235 B.C., he made his appearance at Rome as a dramatic writer. Of his life, we know little; but of his character, rather more. He was very decidedly attached to the plebeian party; and in his plays, satirized and lampooned the Roman nobles with all the virulence and indiscretion of a hot-blooded impetuous Campanian—that Gascon of ancient Italy! His rashness ultimately caused his banishment to Utica in Africa, where he died, 204 or 202 B.C. Besides his dramatic writings, comprising both tragedies and comedies, he wrote an epic poem, *De Bello Punico*, in the old Saturnian meter. Of these, only a few very unimportant fragments are extant, which may be found in Bothe's *Poetarum Latinorum Scenicorum Fragmenta* (Halberstadt, 1824), or Klunmann's collection of the same (Jena, 1843), enriched by a life of Nævius, and an essay on his poetry. See also Sellas's *Poets of the Roman Republic* and Simcox's *Hist. of Latin Liter.* (1882).

NÆ'VUS (known popularly as *mother-spot* or mole) is a congenital mark or growth on a part of the skin. Sometimes it is merely a dark discoloration of the surface as described in the article MACULÆ, in which case it is termed a mole and is perfectly harmless; but often it consists of a dense net-work of dilated blood-vessels, forming a reddish or livid tumor, more or less elevated above the surface of the surrounding skin. The most frequent situations of these vascular nævi are the skin and subcutaneous cellular tissue of the head; but they may occur elsewhere. The popular belief is, that they are caused by

the longing of the mother during her pregnancy for a lobster, or strawberry, or raspberry, or some other red-colored article of food, and that the influence of her mind has impressed upon the fetus a more or less vivid image of the thing she longed for; and hence the name of *mother-spot*. Sometimes these tumors waste away spontaneously, and give no trouble; but frequently they increase rapidly, invade the adjacent tissues, and ulcerate or slough, and thus become dangerous to life by hemorrhage. When these tumors do not show a tendency to increase, no treatment is necessary. When they are obviously increasing in size, the continual application of cold (by means of freezing mixtures), with moderately firm pressure, is sometimes of service; but a more certain method is to employ means to produce such an amount of inflammation as to obliterate the vessels; for this purpose, the seton, the application of nitric acid, and vaccination of the tumor, have been successfully applied. The injection of strong astringents, with the view of coagulating the blood, has sometimes effected a cure. If all these means fail, extirpation, either with the ligature or knife, must be resorted to; the ligature being regarded as the safest and best method. For the various methods of applying the ligature, the reader is referred to any standard work on operative surgery. If the tumor is in an inaccessible spot, as in the orbit of the eye, and is increasing rapidly, the only course is to tie the large vascular trunk supplying it. The common carotid artery has in several instances been tied with success for vascular nævus in the orbit.

NÄ'FELS, a village of Switzerland, in the canton of Glarus, and 5 m. n. of the town of that name, in a deep valley, is one of the most famous battle-fields in the country. Pop. '70, 2,490. Here, in 1388, 1500 men of Glarus, under Matthias am Buhl, overthrew an Austrian force of from 6,000 to 8,000 men. The event is still celebrated yearly.

NA'FTIA, Lago, a curious small lake in Sicily, about two miles from Mineo, in Catania. It is situated in a plain, amidst craggy hills, and is of a circular form, commonly sixty or seventy yards in diameter, and about fifteen feet deep, but in dry weather shrinking to a much smaller size, and being occasionally altogether dried up. In the midst of it are three small craters, two of which perpetually send up water in jets to the height of two or three feet; the third is more intermittent. The water is greenish, or turbid, and has an odor of bitumen. The whole lake resembles a boiling caldron, from the escape of carbonic acid gas, rushing upwards with great force. The atmosphere is consequently fatal to birds attempting to fly across the surface of the lake, and to small animals which approach it to satisfy their thirst; and an approach to it is attended with headache and other painful circumstances to man himself. The ancients regarded these phenomena with great dread. They supposed that Pluto, when carrying off Proserpine, drove his fiery steeds through this lake, ere his descent to the lower regions. A temple was erected here to the gods of the two craters, the *Dii Palici,* who were supposed to be twin sons of Jupiter by the nymph Thalia. Pilgrims flocked to this shrine; and it afforded an inviolable asylum to slaves who had fled from their masters. An oath by the Dii Palici was never broken by the master, who found himself compelled here to come to terms with his runaway slave. No remains of the temple of the Dii Palici are left, although it is described as having been magnificent.

NAGA is, in Hindu Mythology, the name of deified serpents, which are represented as the sons of the Muni Kas'yapa and his wife Kadrû, whence they are also called Kadraveyas. Their king is S'esha, the sacred serpent of Vishn'u.

NAGAPATA'M, a seaport of British India, on the Coromandel coast, in the province of Tanjur, 15 m. south of Karikal. It was taken by the Dutch in 1660, but fell into the hands of the English in 1781. Its site is an open sandy plain, elevated only three or four feet above sea-level. The port is visited by small vessels, and carries on some trade with Ceylon. Pop. at the census of 1881, 53,855.

NAGARJUNA, or Nagasena, is the name of one of the most celebrated Buddhistic teachers or patriarchs—the thirteenth—who, according to some, lived about 400 years, according to others, about 500 years, after the death of the Buddha S'âkyamuni (i. e., 143 or 43 B.C.). He was the founder of the Mâdhyamika school, and his principal disciples were Aryadeva and Budhapâlita. According to the tradition of the Buddhas, he was born in the south of India, in a Brahmanical family. Even as a child, he studied all the four Vedas; later, he traveled through various countries, and became proficient in astronomy, geography, and magical arts. By means of the last, he had several amorous adventures, which ended in the death of three companions of his, but in his own repentance, and, with the assistance of a Buddhist mendicant, in his conversion to Buddhism. Many miracles are, of course, attributed to his career as propagator of this doctrine, especially in the south of India, and his life is said to have lasted 300 years.—See E. Burnouf, *Introduction à l'Histoire du Buddhisme Indien* (Paris, 1844); Spence Hardy, *A Manual of Buddhism* (Lond. 1853); W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

NAGASA'KI, or Nangasiki, a city and port of Japan, opened to foreign commerce by the treaty of 1858, on July 1, 1859, is situated in 32° 44′ n. lat., and 129° 51′ e. long., on the western side of a peninsula in the n. w. of the island of Kiusiu. Previously to 1859, it was the only port in Japan open to foreigners. The harbor, which is one of the most beautiful in the world, is about six miles in width, and three or four in length. To

a person inside, it appears completely land-locked, and it is surrounded by hills of about 1500 ft. in height. These are broken into long ridges and deep valleys; while the more fertile spots are terraced and under cultivation. The town of Nagasaki, which is about a mile in length, and three-quarters of a mile in width, lies on the n. side of the bay; its pop. is estimated at 70,000. The streets in general are clean and well-paved, but the houses are not particularly good, except those possessed by courtesans, and known as "tea-houses." On the hills behind the town are various temples, those dedicated to "Sinto," or the worship of the sun goddess, which is the old national religion of Japan, and those in which the Buddhistic worship, imported from China, is followed. The foreign settlement lies to the s. of the native town, the British, French, German, Prussian, and Portuguese consulates occupying the hilly ground back from the bay. On the opposite side of the bay, the Japanese have a steam-factory, under the direction of Dutch officers, and close by is the Russian settlement. The climate of Nagasaki is genial but variable. The trade of Nagasaki is inferior to that of Kanagawa. Sea-weed, salt-fish, and other articles are exported to China. The exports to Europe are mainly tea, tobacco, coal, ginseng, vegetable wax, and copper. The chief imports are cotton piece-goods, woolen goods, sugar, oils. The total value of imports in 1875 amounted to $1,617,000, and of the exports to close on $2,000,000. The import trade suffers from the absence of wealthy native merchants and of banking facilities. In 1879 the great new dock of Nagasaki, the largest in Japan, was in use. It is 460 ft. long by 89 broad, and 28 deep, and is expected to promote trade.

NA'GELFLUE, the provincial name for a bed of conglomerate belonging to the Mollasse (q. v.), which forms a considerable portion of the strata in the central region of Switzerland, between the Alps and the Jura. It is said to attain the enormous thickness of 6,000 and 8,000 ft. in the Rhigi near Lucerne, and in the Speer near Wesen.

NAGKESUR, the name under which the blossoms of the *Mesua ferrea* are sold in the bazaars of India. See GUTTIFERÆ.

NAGO'YA, a city in Japan, in the province of Owari, a few miles n. of the head of Owari bay, the seat of the Aichi ken, or prefecture, pop. 150,000. The city is regularly laid out, and the castle, built in 1610, is one of the finest among the feudal strongholds still standing intact. Two of its towers were long ornamented by huge images of rampant fish made of copper, covered with plates of solid gold. The great high road called the Tokgido, passes through the city, which has a bustling trade carried on with pack-horses and long narrow carts. Junks and steamers enter and clear at Miya, the seaport, a few miles southward. In the numerous factories in the city, porcelain, faience, cloison-ware, fans, carvings, and laeque work, are made chiefly for export. The art of enameling on porcelain in cloisons of metal threads originated here in 1872.

NAGPUR', an extensive inland province of British India, is under the chief commissioner of the Central Provinces. Its area is 22,343 sq. m., and its pop. in 1880 was 2,758,056; but this designation has been used to include a much greater area. The n. part of the province is mountainous in character, being traversed by spurs of the great Vindhya range; the general slope of the surface is from n. w. to s. e, and the bay of Bengal receives the drainage of the country chiefly through the rivers Máhandí and Wain Gangá—the latter a tributary of the Godávari. The climate is not healthy, and is especially insalubrious in the extensive tracts of low marshy land which abound in the province. The Gonds (see INDIA), supposed to be the aborigines, are the most remarkable class of the inhabitants. They rear fowls, swine, and buffaloes; but their country, forming the south-eastern tracts—about one-third of the whole—is covered with a dense jungle, swarming with tigers. In the more favored districts, where the inhabitants are more industrious, rice, maize, oil, and other seeds, and vegetables are extensively cultivated. The rajahs of Nagpur, sometimes called the rajahs of Berar, ruled over a state formed out of a part of the great Mahratta kingdom. The dynasty, however, died out in 1853, and the territory came into possession of the British. The province has five divisions—cap., Nagpur.

NAGPU'R', a city of British India, capital of the province of the same name, and situated near its n. w. extremity, in an unhealthy swampy hollow, 430 m. in a direct line e. n. e. of Bombay. Inclusive of its extensive suburbs, it is seven m. in circumference It contains no important edifices. The great body of the inhabitants live in thatched mud-tents, interspersed with trees, which prevent the circulation of air, and secrete moisture, thus rendering the town unnecessarily unhealthy The mean temperature of Nagpur is estimated at about 80° F. Cotton cloths, coarse and fine chintzes, turbans, silks, brocades, blankets, woolens, tent-cloths, and articles in copper and brass are manufactured. Here, on Nov. 26 and 27, 1817, a small British force of 1350 men, commanded by col. Scott, defeated a native army of 18,000 men. Pop. '81, 98,300.

NAG'S HEAD CONSECRATION. This story, which was first circulated by the Roman Catholics forty years after the event, with respect to archbishop Parker's consecration, was to the following effect. On the passing of the first Act of Uniformity in the first year of queen Elizabeth, fourteen bishops vacated their sees, and all the other sees excepting that of Llandaff being vacant, there was difficulty in maintaining the hitherto unbroken succession of bishops from apostolical times. Kitchin of Llandaff refused to

officiate at Parker's consecration, and consequently the Protestant divines procured the help of Scory, a deprived bishop of the reign of Edward VI., and all having met at the Nag's Head tavern in Cheapside, they knelt before Scory, who laid a Bible on their heads or shoulders, saying: "Take thou authority to preach the word of God sincerely;" and they rose up bishops of the new church ot England! The story is discredited by the Roman Catholic historian Lingard, and is carefully refuted by Strype in his life of Parker. The facts of the case are, that the election took place in the chapter-house at Canterbury, the confirmation at St. Mary-le-Bow's church in Cheapside, and the consecration in the chapel of Lambeth palace. Scory, then elected to the see of Hereford; Barlow, formerly bishop of Wells, then elected to Chichester; Coverdale, formerly of Exeter, and never reappointed to any see; and Hodgkin, suffragan of Hereford, officiated at the consecration. The Nag's Head story probably arose from the company having possibly gone from Bow church, after the confirmation, to take a dinner together at the tavern hard by, according to the prevailing custom. The due succession of bishops in the English church cannot be proved to have ever been broken.

NAGY, a Rungarian word, meaning "great." It is prefixed to the names of many towns in Hungary and Translyvania. In the present work, many of the towns that take this prefix are given under the name that comes after it.

NAGY ENYE'D, a small town of Transylvania, on the Maros, 17 m. n.n.e. of Karlsburg. It contains a famous Calvinistic college. Pop. '80, 5,362.

NA'GY KARO'LY (i. e. Great Karóly), a town of Hungary, capital of the country Szathmar, 37 m. e.n.e. from Debreczin, on a small feeder of the Theiss. It has several important annual fairs, and a trade in corn and cattle. Pop. '80, 12,523.

NAGY KÖRÖS. See Körös, *ante*.

NAGY—SZEBEN. See Hermannstadt, *ante*.

NAGY—VARAD. See Grosswardein, *ante*.

NAHANT, a t. in Essex co., Mass., situated on a peninsula which extends into Massachusetts bay from the township of Lynn, 9 m. s. of Salem, and 14 m. n. e. from Boston. It is divided into Great Nahant, Little Nahant, and Bass Neck. An isthmus leading from the main land to little Nahant is a mile and a half long and very narrow. Then comes a beach 90 rods long connecting Great Nahant, which contains 463 acres of land. In many places the shores are lined with rocks, rising 20 or 60 ft. above the tide, and the beaches are very hard and smooth. It has been a popular resort for citizens of Boston and vicinity for 30 or 40 years, and here and there along the peninsula are many handsome cottages. among them, those of the late Longfellow, the poet, and the late prof. Agassiz. There are also in the town three small hotels, two churches, and two schools. Pop. (1880) 808.

NA'HUM, one of the twelve minor prophets, was a native either of Elkosh, in Galilee, or the son of a man named Elkosh. The identification of his birthplace with Capernaum (Nahum's village) or a place called Elkosh, on the east side of the Tigris, not far from Nineveh, is the result of vague speculation. He was probably a contemporary of Isaiah, and flourished about 713–711 B.C. The burden of his "vision" (in chap. 3) is the destruction of Nineveh and the downfall of the Assyrian kingdom. His style is full of animation, fancy, and originality, and at the same time clear and rounded. His language throughout is classical, and in the purest Hebrew, belonging to the second half of Hezekiah's reign, or to the time immediately following the defeat of Sennacherib before Jerusalem (2 Kings xix, 35, etc.). A commentary on Nahum, with special reference to the Assyrian monuments lately discovered, has been written by O. Strauss (Berlin, 1853).

NAHUM, BOOK OF (*ante*), has an undoubted place in the canon of Jewish scripture. The precise time at which it was written has not been determined, notwithstanding the diligent investigation of the question that many writers have made. Resemblances are pointed out between it and other prophecies, the most striking being ii., 10, compared with Joel ii., 6; and i., 15, almost identical with Isaiah lii., 7. While these passages show quotation, they do not decide priority. An indication of time is furnished by references which Nahum makes to the subjection of the Jews to the king of Nineveh, from whom the Lord would soon deliver them. "Now will I break his yoke from off thee, and will burst thy bonds in sunder." This prediction applies well to Sennacherib's signal destruction in the reign of Hezekiah, and is thought to indicate that Nahum was contemporary with Isaiah and Micah.

The prophecy is called the burden of Nineveh, the appointed destruction of which, with the resulting consolation to Judah, is the one subject treated of. Chapter i. contains a sublime description of the majesty, retributive justice, power and goodness of God in his government over men; denounces the violence of wicked men against his people as transgression against himself; declares his purpose speedily to break the yoke of the oppressors, and exhibits the messenger of glad tidings going forth to summon the Jews back to the temple and their homes. Chapter ii. foretells with the particularity of history the destruction of Nineveh, announcing the invaders bold approach, calling upon the Assyrians to put forth their utmost strength against him; describing the bloody

shields of his warriors, their splendid attire, their chariots, flashing like lightning through the streets; their warriors breaking ranks in their haste to reach the wall, the opening of the river gates, the undermining of the palaces, the flight of the inhabitants, and the reduction of the city to an empty desert. Chapter iii. arraigns Nineveh as a city of blood and abominable crime, because of which the Lord of hosts would heap ruin and desolation upon it; calling on it to read its own doom in the fate of No-Amon, the Thebes of secular history; declaring that its drunkenness would be the occasion of its ruin, that its strongholds would yield as easily as ripe figs fall when the tree is shaken, that its warriors would be cowards, that its gates would be set open, and all obstructions to the advance of the invaders burned down; and that its multitude of rich merchants and crowned warriors would be like the locusts that darken the land one day, but flee away the next, so that the very place where they had been is not known. The particulars of the prophecy have been definitely fulfilled. 1. As to the last specified, "Their place is not known where they were." All books written more than 40 years ago, that refer to Nineveh, speak of its exact location as unknown. Murray's *Encyclopædia of Geography*, the American edition of which was published in 1840—the year in which Layard first saw the mounds that he afterwards explored—gives what was then the general belief of the civilized world: "The village of Nunia on the Tigris appears to occupy a part of the vast circuit of ancient Nineveh. The only monuments are mounds of earth, similar to those of Babylon, but not nearly so lofty or so perfect. A rampart may still be traced some miles in circumference, surrounded with a fosse and covered with grass." In the most ancient historians there is great confusion, and even contradiction. Herodotus, "the father of history," in one place says it was on the Euphrates, and in another, on the Tigris. The Romans contended with the Persians on its site, from which even ruins had in a great degree disappeared; in 330 B.C. Alexander fought his last decisive battle with Darius on the same plain, without knowing that it had been a renowned seat of grandeur and power; and more than a century earlier still Xenophon and the Greeks passed there the ruins of large deserted cities, which, he says, had in ancient times been inhabited by the Medes. 2. Nahum prophesied that the city should be plundered of all its treasures. When the Arab workmen were cutting open the mounds under Layard's direction, they searched eagerly for the treasures which they believed had been hidden there, and which have been found in the ruins of other ancient cities. But they found only a few fragments of gilding, which had fallen from some of the inscriptions; the explorers uncovered it just as the conqueror had left it. 3. Nahum predicted that easy access would be obtained by the invaders to some portions of the city, but that wherever the inhabitants should resort to their strongholds, these should be subjected to the flames. And from the monuments it plainly appears that while some portions of the city were destroyed by fire, other portions escaped the flames. The n.w. palace at Nimroud had not been burned, but in the s.w. corner many of the alabaster slabs, having been reduced to lime by subjection to intense heat, fell to pieces as soon as they were uncovered. In many parts great accumulations of charcoal were found. Some of the large sculptures were cracked into a thousand pieces. When the ruins of Sennacherib's imposing palace were discovered, it was perceived that a great fire had raged through it, turning the sculptured paneling into lime, and reducing the edifice to a heap of ashes and rubbish.

NA'IA. See Asp and Cobra.

NA'IADES, NAIADA'CEÆ, or **POTAMEŒ,** a natural order of endogenous plants, divided by some botanists into several orders (*juncagineæ, zosteraceæ,* etc.), containing in all not quite 100 known species, all aquatic plants, some of them inhabiting the ocean, some found in lakes and ponds, some in streams. They are all of very cellular structure; the leaves have parallel veins, and the flowers are inconspicuous. To this order belongs the pondweed (*potamogeton*), of which a number of species abound in the still waters of Britain, and of which some are found as far n. as Iceland. To this order also belongs the Grasswrack (q.v.) of our shores, used for stuffing mattresses. The lattice-leaf (q.v.) of Madagascar is one of the most interesting species, and one of the few which attract notice as in any way beautiful.

NA'IADS, in Grecian mythology, the nymphs of fresh-water lakes, rivers, and fountains. They were believed to possess the power of inspiration; hence, soothsayers and others are sometimes called *nympholeptoi* (seized by the nymph). They were represented as half-clothed maidens, and not unfrequently as companions of Pan, of Hercules, the patron of warm springs, or of the Sileni and the Satyrs, in whose jovial dances they join.

NA'IANT, or **NA'TANT** (Lat. *natare,* to swim), a heraldic term applied to a fish when borne horizontally across the shield in a swimming position.

NAIGUE, or **NAIK,** a native subaltern officer among Indian and Anglo-Asiatic troops, whose functions are somewhat analogous to those performed among European troops by the drill-sergeant.

NAILS are flattened, elastic, horny plates, which are placed as protective coverings on the dorsal surface of the terminal phalanges of the fingers and toes. Each nail consists of a *root,* or part concealed within a fold of the skin; a *body,* or exposed part

attached to the surface of the skin; and a free anterior extremity called the *edge.* The skin below the root and body of the nail is termed the *matrix,* from its being the part from which the nail is produced. This is thick, and covered with highly vascular papillæ, and its color is seen through the transparent horny tissue. Near the root the papillæ are smaller and less vascular; hence the portion of nail corresponding to this part is of a whiter color; from its form, this portion is termed the *lunula.* It is by the successive growth of new cells at the root and under the body of the nail that it advances forwards, and maintains a due thickness, whilst at the same time its growth in a proper direction is insured. The chemical composition of the nails is given in the article HORNY TISSUES, to which class of structures they belong. According to the observation of Beau, the finger-nails grow at the rate of about two-fifths of a line in a week, while the toe-nails only grow with about one-fourth of that rapidity. When a nail has been removed by violence, or has been thrown off in consequence of the formation of matter (pus) beneath it, a new nail is speedily formed, provided the matrix has not been seriously injured.

There is a very common and troublesome affection popularly known as *ingrowing nail.* Its most usual seat is by the side of the great toe. It does not in reality arise from any alteration of the nail, but from the adjacent soft parts being constantly pressed by the use of tight shoes against its edge. These parts become swollen and inflamed; suppuration ensues, and an intensely sensitive ulcer is formed, in which the nail is embedded. Surgical advice should at once be resorted to in these cases, as there is no probability that the ulcer will heal spontaneously, especially if the patient continue to move about, and thus keep up irritation. In obstinate cases, it is not unfrequently necessary to remove a portion of the nail, an operation attended with much pain, although quickly performed.

NAILS, pointed pieces of metal, usually with flattened or rounded heads, used for driving into wood-work, for the purpose of holding the pieces together. A variety, in which the head is very large, and the spike portion small, used by shoemakers for protecting the soles of boots and shoes from wear, is called the *hob-nail;* another, which is made by cutting thin plate-iron into thin pointed pieces of various lengths, is called *brads;* these sometimes are without heads, but are usually made with a slight projection by way of a head. When made small, with flat heads, for attaching cloth or hangings in upholstery-work, they are called *tacks;* and when very large for heavy carpentry, *spikes.*

Nail-making.—Formerly, all nails were hand-made, by forging on an anvil; and in Britain and the north of Europe vast quantities are still made in this manner, being preferable, for many kinds of carpenters' work, to those made by machinery. In France, the greater part of the nails used for light carpentery-work are made of soft iron wire, pointed with the hammer; and in order to head them they are pinched in a toothed vice, which leaves the portion for the head projecting, and makes below it three or four grooves in the nail, which increase its hold on the wood when driven home. The head is beaten into a counter-sinking on the vice, which regulates the size.

The iron used for hand nail-making in Britain is sold in bundles, and is called *nail-rods;* it is either prepared by rolling the malleable iron into rods or small bars of the required thickness—which process is only employed for very fine qualities—or by cutting plate-iron into strips by means of rolling-shears; these shears consist of two powerful revolving shafts, upon which are fixed discs of hard steel with squared edges. The discs of one shaft alternate with those of the other; they are of the thickness of the plate to be cut, and the shafts are so placed that a small portion of one set of the discs are inserted between those of the other set. When the shafts are revolving a plate of iron is pressed between the discs; and it is forcibly drawn through, the steel discs cutting the plates into strips with great rapidity. The quantity produced in this way is enormous, some mills turning out at the rate of ten miles per hour of nail-rods.

Several inventions, in which America took the lead, have been introduced, and are successfully worked, for making nails direct from plate-iron, either by cutting them out cold or hot; and a very large proportion of the nails in use are made in this way. Nail-making by machinery was originated in Massachusetts in 1810.

NAILS (*ante*). The whole enormous industry of nail-making in this country, except for wall-nails and shoe-nails, which are cast, and sprigs, headless brads, etc., which are cut out of the plate, involves various machines for cutting and heading. Nearly two dozen patents for improvements in these machines had been granted here by the beginning of the century. The ore, whether hematite or magnetic, is smelted in a blast-furnace, run into pigs, puddled, squeezed, and, if need be, hammered, rolled in the puddling-ball train, and cut to lengths. These are then fagotted, that is, piled so as to break joints, reheated to a white heat, drawn, passed through the nail-plate train, and the sheets, of the required width and thickness, allowed to cool. It is next cut across its length (the width of the sheet being usually about a foot) into strips which are a little wider than the length of the required nail. These plates, heated by being set on edge on hot coals, are seized in a clamp and fed to the machine, end first. The pieces cut out are alternate, and slightly tapering, of course, with the fiber, and are squeezed and headed up by the machine before going into the trough. It is evident that the first cut to the right on a

plate and the last cut on the other side are blanks, though it would seem that an automatic weigher, as in coining, would reject these into the waste heap. The difficulty of the operation lies in the fact that the cuts must be alternate, so that the cutter must either turn half round at each cut, or the plate must be turned over. The great desideratum is to do this automatically and reciprocally. There is no common or unvarying standard for classifying nails. The old way is by sizing from two-penny, 1 in. long, and now 880 to the lb., up to thirty-penny, 4½ in. long, and 16 to the lb. The English names, 7 lb., 8 lb., etc., show that 1000 of that kind should weigh so much. They now, in fact, seldom do. The general divisions are:

a. Material—copper, galvanized, etc.
b. Make—wrought, cut, cast.
c. Length or weight.
d. Size—fine, bastard or medium, heavy.
e. Points—flat, sharp, clinch.
e. Heads—spur, clasp, clout, countersunk, etc.
f. Use—scupper, sheathing, fence, slating, finishing, etc.

NAIN, a village of Galilee, mentioned only in the New Testament as the place where Jesus restored to life the widow's son. Eusebius and Jerome describe it as near Endor. Phocas places it n. of Tabor. The crusaders recognized it, and at the present day it is mentioned by travelers. It is now a small village of 20 houses or huts, and called Nein, containing remains of very ancient buildings and a fountain. It is 4 m. from Tabor, and 2½ m. from Endor. Its situation is beautiful, on the n.w. edge of the "Little Hermon," or Jebel-ed-Dûhy, where the ground slopes into the plain of Esdraelon. The entrance to the place, where the Savior met the funeral, was doubtless up the steep ascent of the plain. On the w. of the village the rock is full of sepulchral caves. On the n. are the wooded hills of Galilee.

NAIN DE TILLEMONT. See TILLEMONT.

NAIRN, in the county of the same name, is a royal, parliamentary, and municipal burgh, and is 15 m. n.e. by rail from Inverness. It is situated at the mouth of the river Nairn, on the w. side, and for that reason was anciently called Iver-nairn. Lying on the southern shore of the Moray firth, which is here about 8 m. across, it commands a grand and extensive view of the coast of Ross-shire, including Cromarty bay, nearly opposite. Nairn was regalized by William the lion. It has little historical interest, and few objects worthy of antiquarian attention. It is principally remarkable for the excellence of its sea-bathing and artificial baths, in which respect it is equal, if not superior, to any town in the n. of Scotland, as a resort in summer. The temperature is mild and equable. The inhabitants enjoy a remarkable immunity from epidemic diseases. There is a commodious harbor. The town has a literary society, a museum, a newspaper, 3 branch banks, and a savings bank. It is conspicuous for good and cheap education. Pop. '81, 4,165. Nairn unites with Inverness, Forres, and Fortrose in sending a member to parliament.

NAIRNE, CAROLINA OLIPHANT, Lady, 1766–1845; b. Scotland; celebrated in her youth for her beauty, and called "the flower of Strathearn." She married, in 1806, William Murray Nairne, who became lord Nairne in 1824. She wrote many songs to the old popular tunes familiar to the Scotch peasantry. Among them are the well-known *Caller Herrin'; The Laird o' Cockpen;* and *The Land o' the Leal.* Her productions all appeared anonymously, and their authorship was not divulged till shortly before her death. Her complete works, with a life by the rev. Charles Rogers, appeared at Edinburgh in 1869.

NAIRNSHIRE is bounded on the n. by the Moray firth, and on its other sides by the counties of Inverness and Moray, of the latter of which it anciently formed a part. It extends n. and s. 22 m., and 15 m. from e. to west. Its area is 215 sq.m., or 137,500 acres, of which about 26,000 are under cultivation. Pop. '80, 10,455, including the burgh of Nairn. Along with Elginshire, it returns one member to parliament. Constituency (1879–80), 280; rental, £35,729. Nairn is the only royal burgh in the county, but there are the villages of Cawdor and Auldearn. The soil is for the most part light and sandy. There is, however, considerable agricultural activity, though the county is, perhaps, better known for its cattle-breeding. An important cattle "tryst" is held at Cawdor once a month during the greater part of the year. The climate of this county is distinguished for its salubrity, and the temperature is remarkably equable. The thermometer in the shade has not risen above 78° 3′, or fallen below 11° 2′, during the last 20 years. According to the latest observations, the yearly rainfall did not amount to more than 26 in., the greatest fall being in October, and the least in April. At Brackla distillery, which belongs to Robert Fraser, esq., from 40,000 to 50,000 gallons of spirits are manufactured annually. The river Nairn runs through the county in a beautiful valley, which presents particularly attractive and romantic scenery in the neighborhood of Cawdor castle, one of the residences of the earl of Cawdor. This castle is of uncertain antiquity, and is in an excellent state of preservation. It was the residence of the ancient thanes of Cawdor, one of whom is mentioned in *Macbeth.* About the year 1510 the estates belonging to the earldom passed by marriage from the old family of Calder into the hands of a

son of the duke of Argyle, and are still in the possession of his descendants. Not a few other objects of antiquarian interest are to be found in the county of Nairn.

NAISSANT, a term applied in heraldric blazon to an animal depicted as coming forth out of the middle—not like *issuant* or *jessant* (q.v.), out of the boundary line—of an ordinary.

NAJA. See COBRA DA CAPELLO, *ante.*

NAKAMURA MASANAWO, a Japanese scholar and writer, b. in Yedo about 1825, one of a hereditary guild of learned men in the university of Yedo, under the patronage of the Tokugawa "tycoons." To his profound knowledge of Chinese and native literature, he added some acquaintance with the Dutch, but soon abandoned it for the English language, a dictionary of which he laboriously copied with the pen. In 1866 he went to England, and studied there two years. Returning to Japan in 1868, he went into seclusion with his master the tycoon, and while there translated into Japanese the constitution of the United States, Washington's farewell address, John Stuart Mill's essay "On Liberty," a copious selection of long passages from the works of standard American and English authors, and an anonymous plea in behalf of Christianity. Voluntarily resigning his rank among the gentry (samurai), he laid aside his two swords, founded a private school, and became a vigorous reformer and practical philanthropist. In 1875 he was made chief director of the imperial female normal school. He has also translated *Wheaton's International Law*, and Smiles's *Self-Help*. He belongs to that quiet but powerful class of men whose words and example have revolutionized Japan.

NAKCHIVAN: a town of Asiatic Russia, Transcaucasia, 83 m. s.e. of Erivan. It is the capital of a district of the same name, comprising also the towns Abbasabad, Mergeri, and Terra Kali which is separated southward from Persia by the Arras river, and was ceded to Russia, 1828. The name is from the Armenian, Naxuana, "first place of descent," and popular tradition asserts it to be the place where the survivors of the deluge landed, and where Noah planted the vine. The district abounds in fruit, especially grapes, and is also rich in salt, but is noted for insalubrity. Pop. of the town, 8,772.

NAKHICHEVAN, ON THE DON, a thriving town of south Russia, in the government of Ekaterinoslav, on the right bank of the Don, and near the mouth of that river, two miles east of Rostov. It was founded in 1779 by Armenian settlers from the Crimea, and has (1880) 16,258 inhabitants, mostly Armenians, belonging to the Greek-Armenian church. The inhabitants are engaged in the manufacture of silver ornaments and woolen goods, and an extensive trade is carried on.

NAKSHATRA (a Sanscrit word of doubtful etymology, but propably a compound of an obsolete base, *naksha*, night, and *tra*, protecting, i.e., literally night-protecting) means properly star, and is used in this sense in the Vedas. At a later period it was applied to the asterisms lying in the moon's path, or to the mansions in which the moon is supposed to rest in her, or rather, according to Hindu notions, *his* path. The number of these asterisms was reckoned originally at 27, later at 28; and mythology transformed them into as many daughters of the patriarch Daksha, who became the wives of the moon. See MOON. Biot, the distinguished French astronomer, endeavored to show that the Hindu system of the Nakshatras was derived from the Chinese *sien;* but his theory, though supported by very learned arguments, has been refuted by prof. Whitney, in his notes to Burgess's translation of the *Sûrya-Siddhânta* (New Haven, United States, 1860), and by prof. Müller in his preface to the fourth volume of the *Rig-Veda* (Lond. 1862); for their arguments leave little doubt that the system of the Nakshatras originated from the Hindu mind.

NAKSHIVAN', a t. in Russian Armenia, near the Aras river; pop. 8,772. According to Armenian tradition it is the oldest city in the world, and was founded by Noah, after the flood. It passed into the hands of the Russians in 1827.

NALA is a legendary king of ancient India—a king of Nishadha—whose love for Damayantî, the daughter of Bhîma, king of Vidarbha, and the adventures arising from, or connected with it—the loss of his kingdom, the abandonment of his wife and children, and their ultimate restoration—have supplied several Hindu poets with the subject of their muse. The oldest poem relating to Nala and Damayantî is a celebrated episode of the *Mahâbhârata* (q.v.), edited both in India and Europe, and translated in Latin by Bopp; in German by Kosegarten, Bopp, Rückert, and Meier; and in English by dean Milman. The two other renowned poems treating of the same legend, but with far less completeness, are the *Nalodaya* (q.v.) and the *Naishadhacharita* of S'rî-Harsha.

NALODAYA is the name of a Sanscrit poem which is highly prized by the modern Hindus. Its subject is the story of Nala (q.v.), but more concisely narrated than in the episode of the *Mahâbhârata*, whence its contents are borrowed; and its reputed author is Kâlidâsa (q.v.). Great doubts, however, must attach to the attribution of the authorship, if by Kâlidâsa the author of *S'âkuntala* is meant, and not some other poet bearing the same name; for the merits of this poem consist neither in elevation of thought nor in richness of fiction: they are sought for by the Hindus in its elaborate and artificial diction, and in its alliteration of every variety, which, to a European mind of culture and taste, would be no more than an intolerable jingle of sounds, devoid of all poetical worth. The text

of the poem, with a modern commentary, has been edited (Berlin, 1830) by F. Benary, and (Calcutta, 1844) by W. Yates, who added to his edition a free metrical translation of the text and an essay on Sanscrit alliteration.

NAMA'QUALAND, GREAT. The extensive region in South Africa n. of the cape Colony, extending from the Orange river, lat. 29° 30′, to Walfish bay, lat. 23°, and stretching inland from the w. coast to the Kalihari desert, comprehending an area of about 100,000 sq.m., is known under the name of Great Namaqualand, being principally inhabited by wandering tribes of Namaquas (q.v.). This region is drained principally by a large periodical water-course, called the Oup, Borradaile, or Great Fish river, which, running from n. to s., a distance of about 450 m., joins the Orange river nearly at right angles, about 90 m. from its mouth. It is generally, except in its northern parts, where the country rises into extensive and lofty plateaus, a most sterile and barren region, and along a coast-line of upwards of 400 m. does not present a single running stream much less a navigable river, although a few little bays along the coast, such as Angra Pequena, Sandwich harbor, and Walfish bay, afford safe anchorages. The valley of the Oup is bounded on each side by ranges of flat-topped barren mountains, which to the eastward die away into the waterless though wooded flats of the Kalihari desert, and coastwards stretch into vast sandy downs, against which the southern Atlantic beats an unceasing surf, rendering landing very dangerous, and enveloping the coast in a perpetual mist. The chief productions of the region are cattle, for the rearing of which the country seems favorable. On the edge of the Kalihari, ivory and ostrich feathers are collected, and copper ore seems abundant in several localities. Guano is found at Ichaboe and many little islands on the coast, and considerable fisheries are carried on by cape houses in many of the bays.

The lion, giraffe, rhinoceros, hippopotamus, and large game generally, are still found in Namaqualand, although fast diminishing before the fire-arms of the Namaquas. The snakes are considered especially venomous. The gemsbok, eland, and other large antelopes, now almost unknown in the Cape Colony, are still numerous in the little-frequented wastes of this region. The climate is extreme, and though, on the whole, not unhealthy, is very trying to European constitutions. The water is generally brackish. The first English traveler in Namaqualand, was sir J. Alexander, who, in 1837, traversed it from n. to south. Charles John Andersson has also explored every part of it. Information on the region may be also found in the travels of Moffat, Campbell, and Le Vaillant. The native tribes, who may perhaps number about 40,000 souls, speak the Namaqua language, the purest type of the Hottentot.

NAMAQUALAND, LITTLE, is a division of Cape Colony s. of the Orange river, formerly part of the district of Clanwilliam, and included with the country n. of it under the general name of Namaqualand. It is a very barren region, covered with rugged volcanic-looking hills, through which the Gariep or Great Orange river appears, through some convulsion of nature, to have forced its way to the sea. Little Namaqualand has of late years afforded a very large supply of copper ore of excellent quality (in 1878 near 12,000 tons); but the mines, although well known to the Dutch 200 years ago, were not worked till after 1852. The principal river is the Orange of the colonists, which divides the Cape Colony from Great Namaqualand; all the other streams are merely periodical torrents, often dry for years. The seat of magistracy is at Springbok Fontein, about 80 m. from the principal harbor, Hondeklip bay, and where are situated the very rich mines of the Cape copper company. Many scattered tribes of Namaquas and Bastard Hottentots roam along the bank of the Orange river, and in the neighborhood of the mines are numerous Dutch farmers and English settlers. All the larger mammalia, except a few gemsbok, are extirpated; but troops of ostriches are still numerous on the grassy flats of the Bushman country. The geological features of this region are peculiarly interesting, and have been thoroughly explored by A. Wylie, on behalf of the Cape government. The rocks are generally of granite or gneiss, intersected with numerous veins of cupreous indications, and near the Oarnge river present many very curious features. The coast line extends for 100 m., with a few little bays, such as port Nalloth and Hondeklip, where there is tolerably safe anchorage, and generally presents a shore covered with low granite rocks. At Hondeklip bay a large boulder painted red forms a distinguishing landmark.

NAMA'QUAS, the principal existing tribe of the race generally known under the name of Hottentot. They inhabit the region called Great Namaqualand, n. of the Gariep or Orange river, and the country a few miles s. of it, as far as the Kamiesbergen. They are a pastoral people of rather predatory habits, and live under the rule of their chiefs, whose powers, however, are of a very limited nature. Differing from the Bosjesmen Hottentots, the Namaquas are a tall, well made, active people, although presenting the usual peculiarities of the race, such as the light olive complexion, the oblique eye, and short tufted hair. They speak a dialect of the Hottentot language, which, however, differs considerably from that used by other tribes of that people. Mission stations of the Rhenish and Weselyan societies have been for many years established amongst them, and in a few localities, near the Cape Colony, with considerable success; and the New Testament and some elementary works have been translated into the Namaqua dialect. On the northern borders of the regions they inhabit, the Namaquas, under the chief

Africaner, the deseendant of a fugitive slave from Cape Colony, have for many years kept up a predatory and bloody war with the tribes of Ovampos and Damaros, who live n. of Walfish bay. The total number of Namaquas eannot exceed between 50,000 and 60,000 souls, scattered over a region of at least 150,000 sq.m.; and there is every prospect of the pure Hottentot tribes soon becoming extinct, or at least absorbed, being gradually supplanted by the more energetic and civilized Bastard races, who, in point of civilization and appearance, are very little inferior to the ordinary Dutch Boer of Cape Colony. Many of the southern Namaquas possess wagons and oxen, and are employed in the transport of copper ore from the mines of Little Namaqualand to the shipping port at Hondeklip bay.

A few of the peculiar customs of the Hottentot tribes, described by Kolben nearly 200 years ago, may be still traced amongst the more remote tribes of the Namaquas; but contact with the Cape Colonists, and the efforts of the missionaries, have partially civilized this race, so that an ordinary Hottentot is quite as respectable a savage, or perhaps more so than his Betjouana or Amakosa brethren.

NAMAYCUSH (*Salmo namaycush*), a fish nearly allied to the salmon and trout, a native of the great lakes and interior rivers of North America. It is often taken of a size varying from 20 to 40 lbs., and is said sometimes to reach 60 lbs. It is much esteemed for the table. It is caught at the same fisheries with the still more prized whitefish (q.v.).

NAME (Sax. *nama*, Ger. *name*, Lat. *nomen*, Gr. *onoma*), the word by which a particular person or thing is signfied in distinction from other persons or things, A name attached to a person is called a proper name. Names distinguishing one individual from another have been in use from the earliest ages of human society. Among the Jews, the name given to a child either originated in some circumstance of birth, or was an expression of religious sentiment. Old Testament names are almost all original—i.e., given in the first instance to the person bearing them; but the Jews, like other nations, after accumulating a considerable stock of names, began to repeat them, and we find few names in the New Testament which had not been used before. In Old Testament times, it was an occasional practice to adopt a change of name on the occasion of an important event in one's life.

The Greeks bore only one name, given on the tenth day after birth, which it was the right of the father to choose, and alter if he pleased. The earliest Greek names are generally expressive of some quality in high estimation, as valor, skill, wisdom, or gracefulness (Callimachus, excellent fighter; Phereerates, strength bringer; Sophron, wise; Melanthus, black flower). In later times, when the faith in the gods was on the wane, names derived from Apollo and Athene, or indicative of the favor of Olympus 'Apollodorus, gift of Apollo), came more into fashion. The eldest son generally bore the name of his paternal grandfather, and the confusion arising from the repetition of the same name was attempted to be obviated by appending the father's name (either simply, or turned into a patronymic), the occupation, the place of birth, or a nickname.

The Romans at a very early period bore two names, and afterward every Roman citizen had three. The *prænomen*, like our Christian name, was personal to the individual—Caius, Marcus, Cneius; in writing, generally abbreviated to an initial or two letters, C., M., or Cn. It was given in early times on the attainment of puberty, and afterward on the ninth day after birth. There were about thirty recognized prænomina. Women had no prænomia till marriage, when they took the feminine form of that borne by their husband. Every Roman citizen belonged both to a *gens* and to a *familia* included in that gens. The second name was the *nomen gentilicium*, generally ending in *-ius*, *-eius*, or *-aius*. The third name was the hereditary *cognomen* belonging to the familia. Cognomina were often derived from some bodily peculiarity, or event in the life of the founder of the family. A second cognomen, or *agnomen*, as it was called, was sometimes added by way of honorary distinction. In common intercourse, the prænomen and cognomen were used without the nomen gentilicium, as C. Cæsar for C. Julius Cæsar, M. Cicero for M. Tullius Cicero. The Roman names were in their origin less dignified and aspiring than the Greek; some were derived from ordinary employments, as Porcius (swinehead), Cicero (veteh grower); some from personal peculiarities, Crassus (fat), Naso (long-nosed); a few from numerals, Sextus, Septimus.

The Celtic and Teutonic names, like the Jewish and Greek, had been originally very significant; but at an early period their exuberance became checked; people contented themselves with repeating the old stock. While the speech of Europe was undergoing a transformation, the names in use remained the same; belonging to an obsolete tongue, their signification by and by became unintelligible to the people using them. Many are derived from "God," as Gottfried, Godwin; some from an inferior class of gods known by the title *as* or *ans*, whence Anselm, Oscar, Esmond; others from elves or genii, Alfred, Alboin, Elfric (Elf King). Bertha is the name of a favorite feminine goddess and source of light, from the same root as the word "bright;" the same word occurs as a compound in Albrecht, Bertram. To a large class of names indicating such qualities as personal prowess, wisdom, and nobility of birth, belong Hildebrand (war brand), Konrad (bold in counsel), Hlodwig (glorious warrior), called by us Clovis, and the

original of Ludwig and Louis. The wolf, the bear, the eagle, the boar, and the lion entered into the composition of many proper names of men, as Adolf (noble wolf), Arnold (valiant eagle), Osborn (God bear). Respect for feminine prowess also appeared in such names as Mathilde (mighty amazon), Wolfhilde (wolf heroine). The spread of Christianity threw a number of the old names into comparative oblivion, and introduced new ones. The name selected at baptism was more frequently taken from the history of the Bible or the church than from the old traditional repertory, which, however, was never altogether disused. Many names, supposed to be local and very ancient, particularly in the Scottish highlands, Wales, and Cornwall, are in reality but corruptions of names of Christian origin which are in use elsewhere. Owen, Evan, and Eoghan (the latter often anglicized into Hector) seem all to be forms of Johann or John. A change of name was sometimes made at confirmation.

Periods of religious and political excitement have had a very powerful influence in modifying the fashion in names. The Puritans would only admit of two classes of names, those directly expressive of religious sentiment—praise-God, live-well—and names which occur in Scripture; these latter indiscriminately made use of, however obscure their meaning, or however indifferent the character of the original bearer of them. Old Testament names were used in preference to New, probably because they did not convey the notion of a patron saint. Old Testament names still prevail largely in America, where exists a medley of Christian names from all possible sources. At the French revolution, names supposed to savor of either loyalty or religion were abandoned, and those of Greek and Roman heroes came into vogue instead. The Augustan period of English literature gave a temporary popularity to such feminine names as Narcissa, Celia, Sabina. In Germany, the names in use are particularly free from foreign admixture; they are almost all either of Teutonic origin, or connected with the early history of Christianity. In Britain, the number of names has, particularly since the reformation, been more limited than in most other countries. In some families of distinction, unusual names have been handed down from father to son for centuries—e.g., Peregrine among the Berties, and Sholto in the Douglas family. The accumulation of two or more Christian names only became common in the present century, and another practice which has gained ground in Britain is the use of surnames as Christian names. More recently, various old names, particularly feminine names, as Maud, Florence, Ethel, have been withdrawn from their obscurity, and resuscitated.

The use of fixed family *surnames* cannot be traced much further back than the latter part of the 10th century. They first came into use in France, and particularly in Normandy. At the Conquest, they were introduced into England by the Norman adventurers, and were general at the Domesday Valuation. Many of the followers of William had taken names from their paternal chateaux or villages on the other side of the channel, names which were used with the French preposition *de* before them. Their younger sons and others applied the "de" to estates awarded them as their portion of the conquered country, and called themselves De Hastings, De Winton, etc., a prefix probably never in vernacular use in England, and completely discarded with the disappearance of Norman-French, unless in a few cases where it was retained for the sake of euphony, or from coalescing with the initial vowel, as in De la Bèche, Danvers (d'Anvers), Dangerfield (d'Angerville). When English was used in place of Norman-French, the "de" was always rendered into "of." The affectation of resuming it in recent times is as unwarrantable in theory as in taste. Such a designation as lord De Tabley of Tabley House is an unmeaning tautology. The Scotch have a more expressive designation when they say Colquhoun of that Ilk. In France and Germany, a territorial surname (denoted by "de" or "von") came, when surnames spread to all classes, to be the mark of nobility, so much so that in latter times, when any one was ennobled by the sovereign, the "de" was prefixed to his previously plebeian and not territorial name. In Britain, the "de" was never considered the test of nobility; the names of some of the most distinguished families were not territorial—e.g., Stewart, Butler, Spencer. In Scotland, surnames were hardly in use till the 12th c., and were for a long time very variable. The assumption of surnames by the common people is everywhere of much later date than their use by noble (gentle) families. As yet, they can hardly be said to be adopted by the people of the wilder districts of Wales.

There are many existing local surnames in Britain besides those derived from the names of the manors of the gentry or landholders. Farms, homesteads, the natural features of the country, all gave their names to those who resided at or near them; hence such names as Wood, Marsh, Dale. The preposition "at" is in a few cases retained, as in Atwood, A'Court, Nash (atten-ash, i. e., at the ash). The traveling habits of the Scots account for such names as Inglis, Fleming, Welsh (the original of Wallace), applied to those who had visited foreign parts; and sometimes a Scotsman, wandering into England, returned with the acquired name of Scott.

A large class of surnames are patronymics, often formed by "son," or its equivalent in the language of the country, added to the Christian name of the father. Names of this sort often fluctuate from generation to generation. Alan Walterson had a son, Walter, who called himself Walter Alanson. The genitive case of the father's name sometimes served the same purpose, as Adams, Jones; and similarly in Italian, Dosso, Dossi. A fashion of using "Fitz," the equivalent of "son," before the ancestral name, as in Fitz-

herbert, prevailed temporarily in Normandy, whence it was imported into England. In the highlands of Scotland, the prefix "Mac" (Macdonald) served the same purpose, which, however, fluctuated far longer than the patronymic surnames of England and the lowlands; so also the "O" (grandson) of the Irish (O'Neil), and "Ap" of the Welsh (Ap Rhys, otherwise Apreece). The "de" of France had sometimes a similar origin, as in d'André d'Hugues; and still more frequently the "de," "dei," or "degli" of Italy—di Cola, di Giacomo.

Office, occupation, or condition, gives rise to surnames—e.g., Knight, Marshall, Page, Smith, Brewster, Shepherd; in Germany and Holland, Rauber and de Rogver (robber). and from such appellatives, patronymics may be again derived; thus, we have Smithson, de Maistre (master's son), M'Nab (son of the abbot), M'Pherson (son of the parson), del Sarto (son of the tailor), etc. So also personal qualities—Black, White, Strong, Stark, Lang (long), Littlejohn, Cruikshanks; and nicknames have not infrequently been perpetuated as surnames. We have also surnames derived from the signs and cognizances which were borne in the middle ages, not only by inns and shops, but by private houses. John at the Bell became John Bell; at Middleburg, in Holland, Simon, apothecary in the "Drake," or Dragon, became Simon Draek; hence, probably, the frequency of family names derived from animals, and also of those beginning with "Saint;" though this last class may, perhaps, sometimes have had its origin in the first owner of the name dedicating himself to the service of the saint in question. In Scotland and Ireland, "The" is a distinctive title borne by the heads of some old families—as "The Chisholm," "The O'Connor Don." In the highlands of Scotland, the chief a clan is usually addressed by the name alone in a marked manner: thus, "Macleod" implies specially Macleod of Dunvegan, in Skye, head of the clan Macleod; "Mackintosh," in like manner, applies solely to Mackintosh of Moy, in Inverness-shire.

In England, the number of existing surnames approaches to 40,000, or about one to every 500 individuals; in Scotland, there are far fewer surnames in proportion to the population. The remarkable predominance of certain surnames in certain localities—as Campbell, Cameron, Maclean in Argyleshire, Macdonald in Inverness, Mackay in Sutherland, Gordon and Forbes in Aberdeenshire, and Scott, Ker, Elliot, Maxwell, and Johnstone on the borders—arises from the clansmen having made a practice of taking the name of their chiefs, considering themselves members of their family by adoption, if not otherwise. Elsewhere than in Scotland, vassals often adopted the names of their lords, and servants those of their masters. Two or more surnames are often borne by one individual, in which case the paternal surname is sometimes placed first, sometimes last; and, in recent times, it is by the name which occurs last that the bearer of the two surnames is most frequently known.

The wife, with us at least, changes her surname to that of her husband on marriage. In the continent, it is not unusual for the husband to append his wife's name to his own; and in Spain, the wife retains her own name, while the son is at liberty to use either paternal or maternal name as he pleases, the choice generally falling on the best family.

Change of Name.—Prior to the reformation, surnames were less fixed than they have since become. Occasionally, younger sons, instead of retaining their patronymic, adopted the name of their estate or place of residence. A great matrimonial alliance was a frequent cause for adopting the patronymic of the wife. With the clergy, ordination was a common occasion of a change of name, the personal surname being exchanged for the name of the place of birth—thus, William Longe became William of Wykeham. In time of political troubles, a new name was often assumed for concealment; and in Scotland, the name of McGregor was proscribed in 1664 by an act of the privy council. In modern times, injunctions in settlements of land, and deeds of entail, are frequent grounds for a change of name, it being made a condition that the devisee or disponee shall assume a certain surname under penalty of forfeiture, a stipulation which the law recognizes as valid. Such an obligation is often combined with one relative to arms. In a Scotch entail, it is a very frequent condition that each succeeding heir of entail, or husband of an heiress of entail, shall assume the entailer's name and arms, or his name and arms *exclusively;* in the former case, he may, if he pleases, continue to use his own surname along with the assumed one. The heir of entail is not held legally to take up any arms not otherwise his own, unless he have applied to the heraldic authorities for leave so to do. Where a Scotch entail contained an injunction to bear arms which had no existence in the official record of arms, the condition has not been held to be null; the heir of entail must apply to the lord lyon for a grant of arms bearing the designation of those disponed. In England, it used to be common to obtain a private act of parliament to authorize one to change his surname; an authority for such a proceeding has generally been given in later times by royal license, which is granted only on a reasonable ground being established for the alteration, to the satisfaction of the kings-at-arms, to whom a remit is made. It has sometimes been supposed that this royal license is necessay to legalize such a change, but the highest legal authorities have laid it down that there is nothing in the law of England to prevent any one, who may consider it for his interest so to do, to change his surname, or even his christian name. The idea, lately prevalent to some extent, is equally erroneous, that an advertisement in a gazette or newspaper, or the execution of some deed, is a necessary form in order to effect a change of name. There are always great inconveniences in changing one's name, which sufficiently account for

the general indisposition to do so, except from a questionable motive. As there is no law to prevent a person from changing his name, so there is, on the other hand, no law to compel third parties to use the new name, and disputes and annoyances arising from such a state of things are matters of course. The change tends, to a certain extent, to destroy the means of identification after the lapse of years, which may or may not be the object desired. Notwithstanding these difficulties and inconveniences, there are many examples of persons who have succeeded after a few years in being generally known under a new name, and of the public as well as his friends recognizing it. The change of name, in general, produces no change whatever on the legal status. A party is equally punishable for swindling, larceny, and other cognate offenses, whatever name he uses; and, on the other hand, if he is legatee, he is not prevented from establishing and receiving his legacy, whatever name he has adopted. It follows from what precedes that no person is punishable for using a new name, though it is sometimes an ingredient for a jury to take into consideration when they are required to infer a particular motive of conduct. The royal license is practically required to be obtained by Englishmen (not Scotchmen) holding commissions in the army, as also when the change of name is to be accompanied by a change of arms, it being the practice of the English heralds' college to refuse to grant arms corresponding to such change, unless the royal license have been obtained. In Scotland a *bona fide* change of name requires neither royal, judicial, nor parliamentary authority, the sole exception being the case of members of the college of justice, who require the permission of the court of session. A royal license is not generally applied for by natives of Scotland, as it is not required to be produced to the lord lyon on applying for a corresponding change of arms. The arms will generally be granted when the lord lyon is satisfied that the change has been made on some reasonable ground, and not from a purely capricious motive; and the fact of the change of name, with the reason why it has been made, are narrated in the new patent of arms. When such change of surname and corresponding change of arms has been made by a Scotsman who is an officer in the army, the authorities of the war office are in the habit of requiring a certificate from the lyon office to the effect that the change is recognized there.

Names of Places.—These, like names of persons, belong, in a great measure, to the language of past races. All over Great Britain, a very large proportion are derived from the Celtic names for natural features of the country. From *gwysg, afow, tam, tav, cluyd* —in the Celtic speeches equivalent to *water* or *river*—we have Esk, Avon, Wye, Thames, Tavy, Clyde. *Pen* or *ben*, hill, gives rise to the names of hills in England and Wales (Penrhys, Penzance), and still more in Scotland (Ben Nevis). So, also, *cwm, comb*, valley —as in Cumberland, land of valleys. The memory of the Roman invasion has been preserved in the termination *chester* (derived from *castra*) in the names of towns, as Manchester. Though surnames often originated in local names, the reverse process also occurred; as where *ville, ton* or *ington, ham*, or *burgh*, has been appended to the name of the owner of the land, e.g., Charleville, Johnston, Wymondham, Edinburgh (i.e., Edwin's burgh).

See Pott's *Die Personennamen und ihre Entstehungsarten* (2 vols., 1853; 2d. ed. 1859), Miss Yonge, *History of Christian Names* (Lond. 1863); Lower, *On English Surnames* (1849); Innes, *Scotch Surnames*, and *Curiosities of Puritan Nomenclature* (1880).

NAMES (*ante*). It is well settled in the United States that no process of law is necessary to effect a change of name. The reason is seen in the fact that names are not originally given by the law, but are established by usage. Thus the foundling named by the first-comer has, from every legal point of view, as good a right to that name if commonly applied to him during his youth as if he had been christened by the highest ecclesiastical authority. Again, a change of name can in any event have but little legal significance; for, if John Doe signs a conveyance as Richard Roe, he cannot void the agreement on that ground; or, if he so signs a bond, he will be estopped from setting it up as a defense. Where the maker of a will has for many years gone under a name not that given to him by his parents, and signs the will in the assumed name, the instrument will not on that ground be set aside. So, in criminal practice, it is of no moment under what name the accused is indicated in a warrant, identification being the only requisite. Nevertheless, the legislatures of the different states have provided a legal process by which a change may receive legal sanction. In New York, application must be made to the county court, or, in New York city, to the common pleas, by petition, stating the grounds of the desire to change, and after due notice and publication an order is granted authorizing the use of the new name. In Massachusetts the application must be to the legislature; other states require application to the probate or surrogate's court.

NAMUR', a province of Belgium, bounded on the n. by Brabant and Liege, e. by Luxemburg, w. by Hainault, and s. by France. Area about 1400 sq. miles. Pop. Dec., '80, 322,654. The principal rivers are the Meuse—which entirely intersects the province —the Sambre, and the Lesse. Namur presents generally an alternation of fruitful valleys and low hilly tracts; but in some parts, where the heights constitute offshoots of the Ardennes and are densely wooded, they attain a considerable elevation. With the exception of the land in the s.w., where there are large tracts of bog and heath, the soil is extremely rich, yielding abundant crops and fine pasture. The chief products

of Namur are wheat, oats, hops, oil-yielding plants, and flax. Besides iron, copper, lead, and coal mines, Namur has marble and slate quarries, and yields sulphur, alum, cadmium, alumina, flints, etc. It has good steel, iron, and smelting works, breweries, paper-mills, etc. Namur is divided into the three arrondissements of Namur, Dinant, and Philippeville. At the close of the 12th c., Namur was united to Luxembourg, after having existed as an independent countship for upwards of 150 years. Towards the middle of the 13th c., it passed by purchase to the house of Flanders, which retained possession of it till 1420; when, on the death of count John III., without direct heirs, the countship, which was in a state of extreme financial embarrassment, was purchased for 132,000 gold ducats, by Philip the good, duke of Burgundy, and subsequently shared the fate of the other Burgundian states.

NAMUR (Flem. *Namen*), the chief t. of the province of the same name, is situated at the confluence of the Sambre with the Meuse, and is a strongly fortified town and the seat of a bishop. Pop. '81, 25,766. Among its 17 churches, the cathedral, or St. Aubin's, which was consecrated in 1772, is one of the most beautiful churches of Belgium. Namur has an academy of painting, a conservatoire for music, two public libraries, a museum, an hospital for aged paupers, a theological seminary, and 2 colleges, one conducted by Jesuits. The present citadel was constructed in 1784, but the city has been fortified from the earliest period of its history; and in 1692, its defensive works were repaired and strengthened by Cochoorn, only, however, to be taken the following year by Louis XIV. and Vauban, the latter of whom added considerably to its original strength. The reputation of its citadel made Namur a prized stronghold in every war of later times; and after having been gallantly defended by its French conquerers in 1815, against the Prussians under Pirch, it was finally restored to the Netherlands after the battle of Waterloo, and at once put into thorough repair. Namur is noted for its cutlery, its leather-works, and its iron and brass foundries.

NÂN'AK, or NÂNEK. See SIKHS, *ante*.

NA'NAS, a t. of Hungary, in the midst of extensive morasses, about 110 m. e.n.e. from Pesth. The population, partly Protestant and partly Roman Catholic, is employed in cattle husbandry and agricultural pursuits. Pop. 11,300.

NANA SAHIB, a Hindu, one of the leaders of the sepoy revolt of 1857. He is said to be the son of a Brahman from the Deccan, and his real name was Dhundu Punt. He was b. about 1820, and was adopted as a son in 1827 by Bajee Rao, the childless ex-peishwa of Poona, thereby, according to Hindu law and custom, acquiring most of the rights of a legitimate son. He was educated as a Hindu nobleman—taught English, and brought much in contact with the European officers, in whose amusements he seemed fond of participating. A decision was, however, come to by the government of Calcutta, that they should not recognize rights to pensions or indemnities acquired by adoption; and in consequence, Nana Sahib was refused the continuance of a pension of eight lacs of rupees, paid to his adopted father under a treaty made in 1818. This is believed to have rankled in his mind, along with slights he received from the supercilious English youth with whom he came in contact. He was allowed to retain some of the state of a native prince—a retinue of 200 soldiers, with 3 field-pieces, and a fortified residence at Bithoor, 10 m. w. of Cawnpore. When the mutiny broke out in May, 1857, he offered to assist the English, but instead he treacherously placed himself at the head of the mutineers. The European troops were induced, on June 25, to capitulate to Nana Sahib, who promised they should be sent down the Ganges in safety. They got on boats provided for them, but had no sooner done so than two guns were unmasked, and a murderous fire was opened upon them. The sepoys were ordered to shoot the men, but to spare the women and children, who, when their husbands and parents had been shot, were removed to a house in Cawnpore. On July 15, sir H. Havelock, who had advanced to their assistance from Allahabad, defeated the sepoys in two engagements, one within 8 m. of Cawnpore; and Nana Sahib next day directed that the women and children should be put to death, an order carried out with unparalleled atrocity. A long series of engagements against Nana Sahib followed, in which he was always the loser, and he was ultimately driven beyond the English frontier into Nepaul. In 1860 his death was announced, but, two years later, new movements were discovered, which were attributed to him, and it is not certainly known whether he is dead or alive. Several persons have been arrested on suspicion of being Nana Sahib, but in all cases a mistake has been made. A column has been erected at Cawnpore in memory of those who perished in the massacre.

NANCE: co., Neb. See page 887.

NANCY, a beautiful t. of France, capital of the department of Meurthe-et-Moselle, is situated on the left bank of the river Meurthe, at the foot of wooded and vine-clad hills, 220 m. e. of Paris, on the Paris and Strasburg railway. Pop. '81, 71,991. It is divided into the old and new towns (the former irregular and with narrow streets, the latter open and handsome), and comprises also two suburbs. It contains many handsome squares and imposing edifices, and owes much of its architectural ornamentation to Stanislaus Leczinsky, who, after abdicating the crown of Poland in 1735, continued to reside here as duke of Lorraine till his death in 1766. His statue stands in the place Royale, a fine square, surrounded by important public buildings, as the hôtel de ville, theater,

etc. The gates of Nancy look more like triumphal arches than the ordinary entrances of a town. Among the institutions are the university-academy, the normal school, the school of medicine, the lyceum, the public library, and numerous art and scientific societies. Cotton, woolen, and linen manufactures are carried on; but the principal branch of industry is the embroidering of cambric, muslin, and jaconet goods. Nancy is known to have existed in the 11th century. Two centuries later, it became the capital of the duchy of Lorraine (q.v.). Charles the bold was killed while besieging Nancy in 1477.

NAND'IDÆ, a family of fishes found in the fresh waters of India, containing three genera, *badis*, *nandus*, and *catopra*. They resemble the basses and sunfishes of America.

NAN'DU, or AMERICAN OSTRICH (*rhea*), a genus of South American birds allied to the ostrich, cassawary, and emu, and most nearly to the ostrich, from which it differs in having the feet three-toed, and each toe armed with a claw; also in being more completely feathered on the head and neck; in having no tail; and in having the wings better developed and plumed, and terminated by a hooked spur. The wings are, indeed, better developed than in any other of the *struthionidæ*, although still unfit for flight. The neck has 16 vertebræ. There are at least three species. The best known species (*R. Americana*) is considerably smaller than the ostrich, standing about 5 ft. high. It is of uniform gray color, except on the back, which has a brown tint. The male is larger and darker-colored than the female. The back and rump are furnished with long feathers, but of a more ordinary kind than those of the ostrich. This bird inhabits the great grassy plains of South America, southward of the equator, abounding on the banks of the La Plata and its more southern tributaries, and as far s. as lat. 42° or 43°. Its range does not extend across the Cordilleras. It is generally seen in small troops. It runs with great celerity, using its wings in aid. It is polygamous, one male securing possession of two or more females, which lay their eggs in a common nest, or drop them on the ground near the nest, to which the male rolls them. Contrary to the usual habit of birds, incubation is performed by the male. The Nandu is shy and wary, but is successfully hunted by the Indians, generally on horseback. The flesh of the young is not unpleasant. The Nandu is capable of being domesticated.—A smaller and more recently-discovered species (*R. Darwinii*) has light-brown plumage, each feather tipped with white. It inhabits Patagonia. A third species (*R. macrorhyncha*) is distinguished by its large bill.

NANKEEN' CLOTH. Calico of the kind called "nankeen," or naked, was formerly imported extensively from China to Europe, and said to be the manufacture of Nanking; the color, a yellowish-buff, being a favorite one. It was supposed that the Chinese held a secret for dyeing this color, which was found to be remarkably durable; but it became known that it was not an artificial color at all, the cloth being made of a colored variety of cotton, which was produced occasionally in China and India. Artificially dyed nankeen cloths now form a considerable export from England to China.

The color of artificial nankeen cloth is produced by an elaborate process, in which the yarn or cloth is first dipped in a saturated solution of alum; then in a decoction of oak-bark; then in a bath of lime-water; and next in a bath of nitro-muriate of tin. Another, but less permanent, nankeen dye is produced by boiling annatto in a strong solution of pearl-ashes, and diluting with water to the required tint.

NANKING', capital of the province of Kiangsu, formerly the capital of China, on the Yangtse river, 90 m. from the beginning of its estuary, n. lat. 32° 40′ 40″, e. long 118° 47′. Its name signifies the southern capital. Since the removal of the seat of government to Peking (northern capital) it has been called by the Chinese Kiangning-fu. The walls inclose an area of nearly 20 m. in circumference, the greater part of which, however, is entirely waste. They reach in many places an elevation of 70 ft., and are fully 30 ft. in thickness at the base. According to Chinese accounts, the population of Nanking was once 4,000,000, but a more recent estimate made it 300,000. As the city, however, has of late passed through so many vicissitudes, it is impossible to ascertain its present number of inhabitants. The inhabited portion of the walled area lies toward the west, and several miles from the bank of the river. It is no longer possible to speak of Nanking in the language which former travelers used. The barbaric desolations to which it was subjected during the Taeping rebellion left it a sort of wreck, and one can only describe it as it was, before the victorious assault of the rebels, Mar. 19, 1853. Nanking is the seat of the vice-regal government for the provinces grouped together under the name of Kiangnan. Here, as elsewhere in China, there was, and again is, a Manchu garrison, or military colony, separated by a wall from that portion of the city which is occupied by the Chinese. Some of the finest streets of Nanking were in the Tartar city; several being nearly 40 ft. wide, having a space in the middle of about 8 ft. in width, flagged with well-hewn blocks of blue and white marble, and on each side of this a brick pavement 14 ft. or more wide. A deep canal or ditch runs from the river directly under the walls on the w., serving to strengthen the defenses of the city on that side. The ancient palaces have all disappeared. The offices of the public functionaries were numerous, but, like the shops, presented the general features common to all Chinese towns. The objects most worthy the inspection of the traveler are found, in ruins, outside the precincts of the modern city. Among these is the summer palace of the emperor Kienlung. It consisted of a number of one-story buildings, with spacious courts

between, and flanked by smaller buildings on the sides. Enough still remains to show that the workmanship was of the most elaborate and unique character. When under cultivation, the spot must have been exceedingly beautiful. The tombs of the kings are remarkable for their sepulchral statues, which form an avenue leading up to the graves; they consist of gigantic figures, like warriors cased in a kind of armor, standing on either side of the road, across which, at intervals, large stone tablets are extended, supported by huge blocks of stone instead of pillars. Among the buildings totally destroyed by the rebels was the far-famed Porcelain tower. It was erected by the emperor Yungloh, to reward the kindness of his mother; the work was commenced in the 10th year of his reign (1413), at noon, on the 15th day of the moon, in the 6th month of the year, and was completed in 19 years. The board of works was ordered, according to the plan of the emperor, to build a tower 9 stories high, the bricks and tiles to be glazed, and of "fine colors;" and it was to be superior to all others, in order to make widely known the virtues of his mother. Its height was to be 322 feet. The ball on its spire was to be of brass, overlaid with gold, so that it might last for ever and never grow dim. From its 8 hooks as many iron chains extended to the 8 corners of its highest roof; and from each chain 9 bells, suspended at equal distances apart; these, together with 8 from the corners of each projecting roof, amounted to 144 bells. On the outer face of each story were 16 lanterns, 128 in all; which, with 12 in the inside, made 140. It required 64 catties of oil to fill them. On the top of the highest roof were two brazen vessels, weighing together 1200 pounds, and a brazen bowl besides, weighing 600 pounds. Encircling the spire were 9 iron rings, the largest being 63 ft. in circumference, and the smallest 24 ft., altogether weighing nearly 5,000 pounds. In the bowl on the top were deposited one white shining pearl, one fire-averting pearl, one wind-averting pearl, one water-averting pearl, one dust-averting pearl, a lump of gold weighing 50 ounces, a box of tea-leaves, 1000 taels of silver, one lump of orpiment, altogether weighing 4,000 pounds; one precious stone-gem, 1000 strings of copper coin, two pieces of yellow satin, and four copies of Buddhist classics. Nanking continued in possession of the Tae-ping rebels till the successes of the troops under maj. Gordon had crushed one after another all their outlying forces, when at length, July 19, 1864, the city was stormed by the imperialist soldiers under the viceroy Tseng Kwo-fan. The last blow was thus dealt to the Tae-ping rebellion, whose principal leader perished by his own hand amid the blazing ruins of the palace he had occupied for 11 years. Since its recapture, Nanking has resumed its former position as the seat of the vice-regal government, but shows few signs of revival from its desolation. It has, however, been made the headquarters of a large military force, and also of an arsenal for the manufacture of cannon and other warlike stores on the European model. Although specified in the treaty of Tientsin (1858) as a river-port to be opened, little or nothing has come of this concession, and but few foreigners are resident in Nanking. Cotton grows abundantly near Nanking.

NANSEMOND, a co. in s.e. Virginia adjoining North Carolina; bounded on the n. by Hampton Roads, drained by Nansemond river and its branches, and crossed by the Seaboard and Roanoke, and the Atlantic, Mississippi, and Ohio railroads; 380 sq.m.; pop. '80, 15,904—8,177 colored. The surface is level, and heavily wooded with cypress, pine, and other trees. The soil is sandy. The principal productions are corn, wheat, oats, and sweet-potatoes. Co. seat, Suffolk.

NANTAS'KET, a narrow peninsula in Massachusetts that extends from Cohasset township into Massachusetts bay about 5 miles. The town of Hull is situated on it, about 9 m. by water and 22 by railroad from Boston. It is a popular summer resort, and has several hotels of great size.

NANTES (anc. *Namnetes* or *Nannetes*), an important seaport t. of France, capital of the department of Loire-Inférieure, is situated on the right bank of the Loire, 30 m. from its mouth, and at a point of confluence with it of the Erdre and the Sèvre-Nantaise, both navigable streams. Besides railways, there is communication with the interior by steamers on the Loire. The natural beauties of the site have been much improved by art, and now, the noble river on which the town is placed, covered with craft of every size and description, the islands that stud its channel, the meadows that skirt its banks, and the bridges (upwards of 16 in number) that cross it and its tributaries here, combine to make the scene a highly picturesque one. Nantes contains numerous squares and churches. Several districts of the town are nearly as fine as the best districts of Paris, the old town having been pulled down between 1865 and 1870. This town possesses numerous striking and beautiful buildings; among which the cathedral of St. Pierre, containing the splendid monument of Francis II., the last duke of Bretagne, and of Marguerite, his wife; and the old castle, the temporary residence of most of the kings of France since Charles VIII., and built in 938, are the chief. There is a public library containing 50,000 vols.; a museum of paintings; and a museum of natural history. The quays, lined on one side with houses, and in some cases planted with trees, afford an agreeable and interesting promenade of about 2 m. in length. The most beautiful promenade, however, formed by the Cours St. Pierre and the Cours St. André, extends from the Erdre to the Loire. It is planted with four rows of trees, bordered with lines of palatial houses, and ornamented with statues. The harbor, 1968 yards in length, is capable of accommodating upwards of 200 vessels. Formerly, vessels of no more than

200 tons could reach the port, all vessels of greater burden unloading at Paimbœuf, at the mouth of the river; but within recent years, much has been done by dredging for the improvement of the river-bed, and large vessels can now reach the harbor. The chief manufactures of Nantes are varieties of linen and cotton fabrics, calicoes, flannels; musical, mathematical, and optical instruments; refined sugar and salt, chemical products, cordage, etc. It contains tan-yards, copper foundries, brandy distilleries, etc., and numerous establishments engaged in the various manufactures to which a port gives rise, as ship-building, the preparation of preserved meats, etc. In 1872 the imports of Nantes were valued at 70,000,000 of francs, the exports at 55,000,000. '81, 117,555.

NANTES, EDICT OF, the name given to the famous decree published in that city by Henri IV. of France, April 13, 1598, which secured to the Protestant portion of his subjects freedom of religion. Among its more important provisions were—liberty to celebrate worship wherever Protestant communities already existed; to establish new churches, except in Paris and the surrounding district, and in the royal residences; and to maintain universities, or theological colleges, of which they had four, those at Montauban, Saumur, Montpelier, and Sedan; adherents of the reformed faith were also to be eligible to all civil offices and dignities; but, on the other hand, they were not allowed to print books on the tenets of their religion, except in those places where it existed; and they were obliged to outwardly celebrate the festivals of the Catholic church, and to pay tithes to the Catholic priesthood. From this period, the Reformers or Huguenots (who then counted 760 churches) had a legal existence in France, but gradually their political strength was crushed by the mighty genius of Richelieu—who, however, never dreamed of interfering with their liberty of worship. Neither did his successors, Mazarin and Colbert; but under the influence of a "penitence," as corrupt and sensual as the sins which occasioned it, Louis XIV., after a series of detestable *Dragonnades* (q.v.), signed a decree for the revocation of the edict, Oct. 18, 1685. The result of this despotic act was that, rather than conform to the established religion, 400,000 Protestants —among the most industrious, the most intelligent, and the most religious of the nation —quitted France, and took refuge in Great Britain, Holland, Prussia, Switzerland, and America. The loss to France was immense; the gain to other countries, no less. Composed largely of merchants, manufacturers, and skilled artisans, they carried with them their knowledge, taste, and aptitude for business. From them England, in particular, learned the art of manufacturing silk, crystal glasses, and the more delicate kinds of jewelry.

NANTUCKET, an island and t. upon it, on the s.e. coast of Massachusetts. The island is 15 m. long and an average of 4 wide, with an area of 50 sq.miles. It was bought from the Indians by Thomas Macy, in 1659, for £30 and two beaver-hats. Nantucket was at one time a great seat of the whale fishery, having, in 1775, had as many as 150 whaling vessels; but this branch of industry has declined since 1846, and since the civil war has become extinct. The harbor is commodious and safe. Nantucket has two newspapers; pop. (1870) 4,123.

NANTUCKET *(ante)*, a co., t., and island, in Mass., is 18 m. s. of cape Cod, 85 m. s.e. of Boston, and is separated from Martha's Vineyard on the w. by a channel 8 m. wide. It is triangular in shape, has a level surface in the s., and is slightly hilly in the north. The soil, for the most part, is sandy and nearly destitute of trees or shrubbery. During the past fifteen or sixteen years farming and fishing have been the chief pursuits of the inhabitants, and, in the summer months, the town is the resort of invalids and pleasure-seekers. It has two banks, five public halls, several public schools, a weekly newspaper, and Baptist, Congregational, Episcopal, Friends, Methodist, Roman Catholic, and Unitarian churches. There is also a public library, containing about 5,000 volumes, and a museum of marine curiosities, the latter of which was founded in 1826 by admiral sir Isaac Coffin. A steamboat runs daily between the town and Wood's Holl, on cape Cod, connecting with a railroad to Boston. Pop. t. '80, 3,727.

NANT'WICH, a small market t. of Cheshire, England, on the Weaver, 20 m. s.e. of Chester. Many of its houses are interesting from their age and construction, being built, in many cases, of timber and plaster, and with overhanging upper stories. The parish church, one of the finest country churches in England, was thoroughly restored in 1864 at great cost. Nantwich was famous in former times for its brine-springs and salt-works. Shoes, gloves, and cotton goods are manufactured, and malting is carried on. Pop. (1881) 7,488.

NA'OS (Gr. a dwelling), the cell or inclosed chamber of a Greek temple.

NAPA, a co. on the coast of California, n of San Pablo bay; drained by Napa river, and Putah creek; 828 sq.m.; pop. 13,235, a part of which are Chinese. It has fertile valleys, and a range of mountains. The principal mountain is St. Helena, situated at the head of Napa valley, which rises 4,343 ft. above the sea. In the co. is a wonderful forest of petrified trees of large size, also springs of sulphur and borax, and a cinnabar or quicksilver mine. The leading products are wool, grain, butter, and wine. It is traversed by the California Pacific railroad. Co. seat, Napa City.

NAPH'THA is derived from the Persian word *nafata*, to exude, and was originally applied to an inflammable liquid hydrocarbon (or rather a mixture of several hydrocar-

oons) which exudes from the soil in certain parts of Persia. (According to Pelletier and Walter, it consists of three hydrocarbons—viz., $C_{14}H_{13}$, which boils at 190°; $C_{16}H_{16}$, which boils at 239°; and $C_{24}H_{22}$, which boils at 374°.) The term is, however, now used not only to designate a similar and almost identical fluid, that issues from the ground in many parts of the world, and is known as petroleum, rock-oil, etc., but is also applied to other liquids which resemble true naphtha in little else than their volatility and inflammability. Thus, wood-spirit, or methylic alcohol, is often spoken of as *wood-naphtha*, and acetone is sometimes described as naphtha. Coal-tar yields by distillation a liquid which has a heavier specific gravity and a lower boiling-point than Persian naphtha, but resembles it in general properties, and can generally be substituted for it. See GAS-TAR.

Crude naphtha, whether occurring as a natural product or as obtained from coal-tar, is purified by agitation with strong sulphuric acid; after which it must be well washed with water (in which it is quite insoluble), and finally distilled from quicklime. Pure naphtha is colorless, and of a peculiar taste and odor; it is soluble in about eight times its bulk of alcohol, and dissolves in all proportions in ether and in essential oils. Hot naphtha dissolves phosphorus and sulphur, but deposits them on cooling. It is an excellent solvent for gutta-percha, caoutchouc, camphor, and fatty and resinous bodies generally; and hence it is extensively used in the arts for these purposes, and its employment as a source of artificial light is now becoming universal. In consequence of its containing no oxygen, it is employed by chemists for the preservation of potassium and other metals, which have a powerful affinity for oxygen. Owing to its volatility and inflammability, it must be handled with great caution, many fatal cases having arisen from its vapor catching fire on the approach of a candle.

The principal kinds of naphtha known in commerce are native naphtha, coal naphtha, Boghead naphtha (also called paraffin oil and photogen), shale naphtha, and naphtha from caoutchouc and caoutchine.

Native naphtha, petroleum, or rock-oil is found in many parts of the world, as in Japan, Burma, Persia, the shores of the Caspian sea, Siberia, Italy, France, and North America. It is of various degrees of consistency, from a thin, light, colorless fluid found in Persia, with a specific gravity of about 0.750, to a substance as thick as butter, and nearly as heavy as water. But all the kinds when rectified have nearly the same constitution. They contain no oxygen, and consist of carbon and hydrogen compounds only. Bitumen and asphaltum are closely allied substances in a solid or semi-solid form. From a very early period in Persia and Japan, and at least since last century in Italy, native naphtha has been used to burn in lamps.

Coal-tar naphtha (see GAS-TAR), as stated above, is of a higher specific gravity than native naphtha—viz., from 0.860 to 0.900, and has a more disagreeable and penetrating odor.

Paraffin oil, for some time known also as Boghead naphtha, has become, of late years, so important a manufacture that a brief history of its origin cannot be uninteresting. In the year 1847 Mr. James Young, now of the Bathgate chemical works, had his attention called to a petroleum spring at Alfreton, in Derbyshire, from which he distilled a light thin oil for burning in lamps, obtaining at the same time a thicker oil, which was used for lubricating machinery. After a year or two the supply began to fail, but Mr. Young, noticing that petroleum was dropping from the sandstone roof of a coal-mine, conjectured that it originated by the action of heat on the coal-seam, the vapor from which had condensed in the sandstone, and supposed from this that it might be produced artificially. Following up this idea, he tried a great many experiments, and ultimately succeeded, by distilling coal at a low red-heat, in obtaining a substance resembling petroleum, which, when treated in the same way as the natural petroleum, yielded similar products. The obtaining of these oils and the solid substance paraffin from coal formed the subject of his now celebrated patent, dated Oct. 17, 1850.

In the years 1860 and 1864 long and costly litigations as to the validity of Mr. Young's patent took place in Edinburgh and London, resulting in the main in his favor. Many years ago Reichenbach had, by distilling 100 lbs. of pit-coal, obtained nearly 2 oz. of an oily liquid exactly resembling natural naphtha; and various other chemical writers were appealed to, as proving that methods substantially the same as Mr. Young's were previously known and practiced. One thing seeme to have been admitted, that previous to his patent no one had succeeded in producing the oil on a commercial scale.

The processes by which the oil and paraffin are obtained are simple. The material best adapted for the purpose was for years believed to be Boghead coal, a very rich gas-coal, occurring in a field of limited extent near Bathgate, in Linlithgowshire. All cannel coals, however, give the same products, and some of them in nearly as large quantity; but, as stated below, shale is now generally used and treated in the same way. The coal is broken into fragments like road-metal, and gradually heated to redness in cast-iron retorts, which are similar to those used for coal-gas (see GAS). The retorts are most usually upright, about 10 ft. long and 14 in. in diameter at the bottom, tapering to 12 in. at the top, and built in sets of 3, 4, or 6, so that one fire may heat each set. The coal is fed by means of a hopper on the top of the retort, and after passing through it at a low red-heat, is drawn out as coke at the bottom, where there is a water lute to prevent the escape of oil or gas. There is a spherical valve in the hopper, counterpoised

with a weight, which closes the retort at the top. The volatile matters distilled from the coal are conducted by a pipe to the condensers (similar to those used for coal-gas), where they are condensed into a thick black oil, of a specific gravity of about 0.900, along with a little water. Great care is necessary to prevent the heat from becoming too high, because gas and gas-tar, and not paraffin oil, are obtained when coal or shale is distilled at a high temperature. A ton of Boghead coal gave about 120 gallons of crude oil.

The crude oil from the first distillation is then distilled again in long cylindrical malleable-iron stills. From this second distillation a "green oil" is obtained, and the residue is removed as coke from the bottom of the still. This oil is then mixed with from 5 to 10 per cent of sulphuric acid, and afterwards with about the same quantity of soda, the mixtures being made in circular tanks with revolving stirrers. Both the acid and the soda mix with impurities, which fall to the bottom as heavy tarry matters, and are run off by a stop-cock, till only the clear supernatant oil remains. After being so far purified, the oil undergoes three further distillations, being at the same time treated with strong acid (1 per cent) and soda. The final result is that a small quantity of light naphtha is obtained in the later distillations, three-fourths of what is left being a light and nearly colorless oil used for burning in lamps, and the remainder a thicker oil containing paraffine. This latter portion is pressed in a hydraulic press, which squeezes out the greater portion of the paraffine, leaving an oil which is sold for lubricating machinery.

The crude paraffine, after being subjected to hydraulic pressure three or four times, is chiefly purified, by repeated crystallizations, from naphtha. Steam is afterwards blown through it in a melted state, and when finally treated with 3 per cent of animal charcoal it is an exquisitely beautiful substance, resembling the purest white wax. It is largely manufactured into candles, which equal, or even excel, in appearance those made from wax, and are only about half as costly. Paraffine has now a number of curious minor applications.

Shale naphtha, or "shale-oil," is a substance which has been manufactured, for many years, from bituminous shales, both in England and on the continent. Partly because the Boghead coal has become practically exhausted, but chiefly because the volatile products from it are more easily purified than from any coal, beds of bituminous shale found in the carboniferous formation are now almost entirely used in Scotland as the raw material from which paraffine oil and paraffine are obtained. Previous to 1856 these shales were turned to no account. See SHALE.

Naphtha from caoutchoue, or caoutchine, is obtained from caoutchoue by destructive distillation. In composition it consists mainly of hydrocarbons, having the same proportion of carbon to hydrogen as india rubber. Caoutchine has the reputation of being one of the best known solvents for india rubber.

Until the discovery of the Pennsylvanian, the Burmese (Rangoon) petroleum, or rock-oil, was one of the best known. It is obained in a treacly state by sinking wells about sixty feet deep in the soil, and consists of several fluid hydrocarbons, with about ten or eleven per cent of the solid hydrocarbon paraffine. The different naphthas it contains are highly prized as burning and lubricating oils, and for removing greasy stains, on account of their agreeable smell. The naphtha which is found abundantly at Baku, on the shores of the Caspian sea, closely resembles the Rangoon in its qualities. The Persian naphtha is frequently pure enough for burning without rectification.

Prominent among the wonders of our time, however, as regards new fields of industry and wealth, stand the discoveries of the naphtha, or, as they are called, the petroleum regions of the United States. Some of these sources of native naphtha were known to the Indians, by whom it was at one time collected for sale; but it is little more than twenty years since, by sinking deep wells, the great extent of the oil-bearing strata became known. The principal supplies are obtained in Pennsylvania, West Virginia, and Ohio, a considerable quantity being also obtained in west Canada. Other regions in North America produce it, but the Pennsylvanian yield is six or seven times greater than all the rest put together. Consul Kortright, in his report on the states of Pennsylvania, Ohio, etc., for 1870 and 1871, says: "The oil regions are 100 miles in length by 30 to 50 in breadth, and the number of wells to be tapped so great that the supply is considered to be sufficient for a century to come at least."

Much curiosity exists respecting the origin of these great natural sources of petroleum. It seems to be the general opinion of geologists that it has in most cases been produced by the decomposition of both vegetable and animal matters. In this respect it differs from coal, which has arisen from the decay of vegitable matter alone. It would appear that the Pennsylvanian oil proceeds from shales of carboniferous age; the Canadian from those of Devonian age. In both countries the oil is found in cavities in sandstone, and has therefore been derived from subjacent rocks. It is now known that petroleum has formed in rocks of nearly all geological ages. Prof. Dana, the American mineralogist, says that the conditions favorable to the formation of native naphtha, as shown by the characteristics of the deposits in which it is found, are: (1) the diffusion of organic material through a fine mud or clay; (2) the material in a very finely divided state; and (3), as a consequence of the preceding, the atmosphere excluded as far as possible from the material undergoing decomposition.

In Pennsylvania the first borings for petroleum took place in 1859, and in that year

82,000 bbls (reckoned at 43 galls. each) were obtained; in 1861 the produce had reached 2,000,000 bbls.; and since then, as a rule, it has increased from year to year. In 1872 the total produce of North America was 7,394,000 bbls.; Canada furnishing 530,000 bbls. In the same year the total exports from the United States of refined petroleum amounted to 2,951,310 bbls., an enormous quantity, considering the first exports took place so recently as 1861. Of late years the petroleum trade is said to have employed in North America as many hands as coal-mining and the working of iron. See OIL WELLS.

In 1862 and 1871 acts of parliament were passed limiting the amount of petroleum to be kept in store, and regulating the sale of such kinds as give off an inflammable vapor below 100° F. There are special warehouses for the reception of petroleum at the London and Liverpool docks.

Terrible accidents have now and then happened with some of the more inflammable American oils, by reason of their vapors exploding in the reservoirs of lamps. Most of these have, no doubt, taken place with oils whose vapors form an explosive mixture with air at a temperature below 100° F., but they can hardly be considered safe if their vapors will take fire on the approach of a light at less than 120° F. The vapor of the paraffine oil prepared for illuminating purposes by Young's mineral oil company, and no doubt by other firms, from Scotch shale, will not form an explosive mixture below 120° F., and it is therefore quite safe. Since this oil has to compete with petroleum, such a standard can only be kept up at a loss, and there is therefore a great temptation to keep down the firing-point of these burning oils as low as possible, with a view to greater profit; and although accidents have happened with paraffine oil, as well as with American petroleum, there is little doubt that the latter cannot be so thoroughly relied upon for safety. It could easily be made so, however, if the lighter hydrocarbons which it contains were carefully removed.

NAPHTALI, TRIBE OF, named after a son of Jacob, recorded as numbering 53,400 adult males at the exodus, being then the 6th in numbers among the 12 tribes. On its arrival at the outskirts of Palestine, it was only 8th in number. In the journey through the wilderness its place was n. of the tabernacle, near the tribes of Dan and Asher, with which it constituted the "camp of Dan." The ensign of the three is represented by the Jewish legends as a serpent, bearing the inscription "Return, O Jehovah! unto the many thousands of Israel." The territory allotted to Naphtali was situated in n.e. Palestine, bounded on the n. by the Leontes river, on the e. by lakes Galilee and Merom, and the Jordan, on the s. by the Zebulun, and on the w. by Asher. It included the w. shore of the sea of Galilee. Its surface and scenery were more diversified than those of the other tribes. Its s. portion, and especially the plains along the shore of the sea of Galilee were the most fertile region of Palestine. The tribe of Naphtali, under the leadership of Barak of Kedesh-Naphtali, repelled the invasion of the Canaanites under Sisera and Jabin (Judg. x.), and their valor is extolled in the song of Deborah. In the reign of Solomon, Naphtali was under the charge of Ahimaaz, his son-in-law. The head of the tribe in David's time was Jerimoth ben Azriel. In the reigns of Asa, king of Judah, and Baasha, king of Israel, Benhadad, king of Syria, "sent the captains of the host which he had, against the cities of Israel, and smote all Cinneroth, with all the land of Naphtali" (I. Kings, xv, 20). About 730, Tiglath Pileser ravaged n. Palestine and carried off the population to Assyria, and the history of the tribe ends at this point.

NAPHTHAL'IC GROUP OR SERIES. The starting point of the group is *Naphthalin* ($C_{20}H_8$), a substance of great interest in the history of organic chemistry, from its being that upon which Laurent chiefly founded his theory of substitutions. It may be obtained in various ways, but is most easily and abundantly produced from the last portions of the distillate of coal-tar, which become semi-solid on cooling. The liquid part of this mass is got rid of by pressure, and the naphthalin is then taken up by hot alcohol, from which it is obtained in a pure state by crystallization and sublimation.

Naphthalin crystallizes in large, thin, rhombic plates, which are unctuous to the touch, and have a pearly luster. Exposed to light under a glass covering, it gradually sublimes at an ordinary temperature in splendid crystals. It has a somewhat tar-like odor, and a pungent and somewhat aromatic taste. It fuses at 174°, and boils at 4288. Its specific gravity, in the solid state, is 1.15, and as a vapor, 4.528. It is not very inflammable, and when ignited, burns with a white smoky flame. It is insoluble in water, but dissolves readily in alcohol, ether, and the fixed and essential oils.

By acting on naphthalin with an excess of sulphuric acid, we obtain *sulpho-naphthalic acid* ($C_{20}H_8S_2O_6 + 2Aq$), from which, by substitution processes, a lare number of compounds are produced. With nitric acid, naphthalin yields nitro-naphthalin [$C_{20}H_7(NO_4)$], binitro-naphthalin [$C_{20}H_6(NO_4)_2$], and trinitro-naphthalin [$C_{20}H_5(NO_4)_3$], the group (NO_4), or its multiples, being substituted for one, two, and three equivalents of the hydrogen of the naphthalin. The final product of the prolonged action of boiling nitric acid on naphthalin is a mixture of oxalic and *naphthalic* or *phthalic acid;* the re-action being shown by the equation:

$$\overbrace{C_{20}H_8}^{\text{Naphthalin.}} + \overbrace{O_{16}}^{\text{Oxygen.}} = \overbrace{2HO,C_4O_6}^{\text{Oxalic Acid.}} + \overbrace{2HO,C_{16}H_4O_6}^{\text{Naphthalic Acid.}}$$

This acid is also obtained by the continued action of nitric acid upon alizarin, which is an important fact, since it indicates a connection between naphthalin and the coloring matter of madder.

Laurent has discovered a very numerous series of substitution compounds formed upon the type of naphthalin, into the composition of which chlorine enters. They are of little practical importance although their investigation has exerted a remarkable influence upon the progress of organic chemistry.

NAPIER, Sir CHARLES, K. C. B., English admiral, was cousin to the hero of Scinde and the historian of the peninsula war. His father was the hon. capt. Charles Napier, R. N., second son of Francis, fifth lord Napier. He was born March 6, 1786, at the family seat, Merchistoun Hall, in the co. of Stirling. At 13, he went to sea as a naval volunteer. In 1808, he received the command of the *Recruit*, 18 guns, and had his thigh broken by a bullet. He kept up a running fight, in his 18-gun brig, with the rearmost of three French line-of-battle ships, the *D'Hautpoult*, which escaped from Guadeloupe, and was thus instrumental in her capture. This obtained him a post-captaincy; but being thrown out of active service, he served ashore as a volunteer in the peninsular army, and was wounded at Busaco. Commanding the *Thames* in 1811, he inflicted an incredible amount of damage upon the enemy in the Mediterranean, and also conducted several desperate land operations with marked success. In 1814, he was ordered to America, and led the way in the hazardous ascent and descent of the Potomac. He afterwards took an active part in the operations against Baltimore. In 1829, he received the command of the *Galatea*, a 42-gun frigate, and was employed "on particular service" on the coast of Portugal. Becoming acquainted with the leaders of the constitutional party, he accepted the command of the fleet of the young queen; and by defeating the Miguelite fleet, he concluded the war, and placed Donna Maria on the throne. He was made admiral-in-chief of the Portugese navy, and attempted to remodel it; but official and corrupt influence was too strong for him, and he returned to England. In the war between the Porte and Mehemet Ali, he organized a land force, with which he stormed Sidon, and defeated Ibrahim Pasha among the heights of Mount Lebanon. He took part in the naval attack on Acre, and did not hesitate to disregard the orders of his chief, admiral Stopford, when he saw the way to bring the battle to a speedy termination. He next blockaded Alexandria, and concluded a convention with Mehemet Ali. In 1847, he received the command of the channel fleet. When the Russian war broke out, he was sent out to command the Baltic fleet; but the capture of Bomarsund failed to realize the high expectations formed of Napier's exploits. He twice sat in parliament, and, until his death, Nov. 6, 1860, he labored with success to reform the British naval administration. He was at the time of his death a vice-admiral and a knight of several foreign orders.

NAPIER, Sir CHARLES JAMES, G.C.B., English gen., one of several brothers distinguished for their bravery, three of whom—Charles, William, and George—were known in the peninsular war as "Wellington's colonels." They were sons, by a second marriage, of hon. col. George Napier, grandson of Francis, fifth lord Napier, who was fifth in descent, but through two females in succession, from the inventor of Logarithms. Charles, the eldest, was born at Whitehall, Westminster, Aug. 10, 1782. Before he had finished his twelfth year, young Napier received a commission in the 22d Foot. His first service was in Ireland, where he assisted in putting down the rebellion He commanded the 50th Foot during the retreat on Corunna; and at the fatal battle in which sir J. Moore fell, he was wounded in five places and made prisoner. Marshal Ney dismissed him, with permission to go to Engiand on parole. On his return, he engaged in literary works, and even wrote an historical romance. In 1811, he returned to the peninsula. At Coa, where he fought as a volunteer, he had two horses shot under him. At Busaco, he was shot in the face, having his jaw broken and his eye injured. He recovered in time to be present at the battle of Fuentes d'Onoro and the second seige of Badajoz. After distinguishing himself in innumerable skirmishes. the daring soldier returned to England. He next took part in a fighting cruise off the Chesapeake, capturing American vessels, and making frequent descents upon the coasts. He did not return to Europe soon enough for Waterloo, but was engaged in the storming of Cambray, and accompanied the army to Paris. After the peace he was, in 1818, made governor of the island of Cephalonia, the affairs of which he administered with great energy and intelligence. Being, however, of an excessively combative disposition, he became embroiled with the authorities at home. In 1841 he was ordered to India to assume the command of the army at Bombay. This was the most splendid period of his career, resulting in the conquest of Scinde against terrible odds. His destruction of a fortification called Emaun Ghur in 1843, was described by the duke of Wellington as one of the most remarkable military feats he had ever heard of. The fearful battle of Meane followed, where Napier, with 1600 English and sepoys, defeated near 30,000 Beloochees, strongly posted, with the loss of 6,000 men. The Ameers surrendered, except Shere Mahomed, who brought 25,000 men into line of battle at Hydrabad. Napier had only 5,000 men, but in three hours his little army gained a decisive victory. A few days afterwards, Napier was in the palace of the Ameers, and master of Scinde. He was fortunate in possessing the entire confidence of lord Ellenborough, who made him governor of Scinde. His

civil administration was scarcely less remarkable or less successful than his military operations. He gained the respect and reverence of the inhabitants, but soon became engaged in an acrimonious war of dispatches with the directors. In 1847, he returned to England. After attending a series of festivals in his honor, he lived in retirement until the disasters of the last Sikh war caused the eyes of his countrymen to be turned to the hero of Scinde as the deliverer of our Indian empire. He went to India, but found on his arrival that the Sikhs had been routed. He now turned his attention, as commander-in-chief of the army in India, to the subject of military reform. He bade a final adieu to the east in 1851, and returned to his native country, where he resided until his death, which took place at his seat, at Oaklands, near Portsmouth, Aug. 29, 1853. He had then attained the rank of lieut.gen., was G.C.B., and col. of the 22d Foot. It must be remembered to his honor that he was the first English gen. who ever recorded in his dispatches the names of private soldiers who had distinguished themselves, side by side with those of officers. Brave to rashness, ready alike with tongue, pen, and sword, quarrelsome with his superiors, but beloved by his soldiers, and, to crown all, of a strangely wild yet noble and striking appearance, Napier was one of the most remarkable men of his time, and in losing him the country lost one of its brighest military ornaments. His statue was, after his death, erected in Trafalgar square. The story of his *Conquest of Scinde* has been written by his brother, lieut.gen. sir WILLIAM FRANCIS PATRICK NAPIER, K.C.B., born Dec. 17, 1785, who served in the peninsular campaign, and was engaged from 1824 to 1840 in preparing his *History of the Peninsular War*, the greatest military history in the English language. He died Feb. 12, 1860, at Scinde house, Claphman, and was followed in a few weeks to the tomb by his wife, lady Napier, niece of the great C. J. Fox. Her extraordinary skill in translating French documents written in cypher, and her indefatigable labors as her husband's amanuensis, are touchingly commemorated in the preface to the edition of the *History of the Peninsular War*, published in 1851.

NAPIER, JOHN, Laird of Merchiston, was b. at Merchiston castle, near Edinburgh, in 1550, and d. there on April 4, 1617. After attending the regular course in arts at the university of St. Andrews, he traveled for some time on the continent, and returned to his native country highly informed and cultivated for the age. Declining all civil employments, for which his many accomplishments eminently fitted him, he preferred the seclusion of a life devoted to literary and scientific study. From this time his history is a blank till 1593, when he published his *Plaine Discouery* (or "interpretation") *of the whole Reuelation of Saint John* (Edin. 5th ed. 4to, 1645), a work displaying great acuteness and ingenuity, but, it is scarcely necessary to add, not in any sense a "plaine discouery" of the apocalypse. In the dedication to king James VI. he gave his majesty some very plain advice regarding the propriety of reforming his "house, family, and court;" and on republishing the work he added a supplement, resolving "certaine doubts mooved by some well-affected brethren." About this time he seems to have devoted much of his time to the invention of warlike machines, but these inventions were never perfected, probably from motives of humanity. Like other eminent men of the time, Napier, though a strict Presbyterian, seems to have been a believer in astrology and divination, but there is no satisfactory proof that he ever practiced these arts. In 1596 he proposed the use of salt as a fertilizer of land, an idea which, though scouted at the time, is now generally received. Another large blank in his history here occurs, and terminates in 1614, at which date he first gave to the world his famous invention of logarithms (q.v.), in a treatise entitled *Mirifici Logarithmorum Canonis Descriptio* (4to, Edin.). This was followed by another work, *Rabdologiæ, seu numerationis per Virgulas libri duo* (Edin. 1617), detailing an invention for simplifying and shortening the processes of multiplication and division. See NAPIER'S BONES. He also prepared a second work on logarithms, showing their mode of construction and application, with an appendix containing several propositions of spherical trigonometry, and those formulæ which are now known by his name. This work was published after his death by his son Robert, under the title of *Mirifici Logarithmorum Canonis Constructio, etc., quibus accessere Propositiones ad Triangula sphærica faciliore calculo resolvenda, etc.* (Edin. 1619), and occurs along with the *Canonis Descriptio*. The latter work is included in baron Masere's extensive collection, the *Scriptores Logarithmici* (Lond. 1808). Napier's eldest son, Archibald, was raised to the peerage as the first lord Napier by Charles I. in 1627, and his descendants still bear the title. Two lives of Napier have been published, the one by the earl of Buchan (1787), and the other by Mr. Mark Napier (1834).

NAP'IER, MACVEY, 1776–1847; b. Scotland; educated at the universities of Glasgow and Edinburgh. He was intended for the law, and served an apprenticeship with a member of the society of writers of the signet, of which he afterwards became librarian. He was soon chosen by the society to fill a lectureship on conveyancing, newly established by the society, and soon after transferred into a professorship at the university of Edinburgh. In 1814 he was selected to edit the *Supplement to the Encyclopædia Britannica*. He was to have edited a new edition of that work, but was prevented by the failure of its publisher, Constable of Edinburgh. In 1830, on the accession of the whigs, he was appointed principal clerk of session, and resigned his office of librarian. He had long been an occasional contributor to the *Edinburgh Review*, to the editorship of

which he succeeded upon the appointment of Jeffrey as dean of the faculty of advocates. Thereafter he wrote little himself, but he was a successful editor, and enjoyed the confidence of the many distinguished contributors to the *Review*.

NA'PIER, Robert, 1791–1876; b. Scotland; son of a blacksmith, who sent him to a grammar school, where he learned, besides the ordinary English rudiments, French, Latin, and landscape drawing. After serving an apprenticeship with his father he went to Edinburgh, and afterwards to Glasgow, where, in 1815, he began the blacksmith's business, with two apprentices. In 1823 he built his first marine engine, which was the beginning of a prosperity which gradually extended his works till they employed a force of 3,000 men. In 1830 he furnished the steamships for the Dundee and London shipping company; in 1839 he built the *Fire-King*, the fastest steamer then constructed, and in 1840 he supplied the Cunard company with their first four steamers. He received the great gold medal at the Paris exposition in 1855.

NAPIER, The Right Hon. Sir Robert Cornelius, Baron Napier of Magdala, was b. in Ceylon, Dec. 6, 1810, and was educated at the military college at Addiscombe. He entered the Bengal engineers in 1826, served in the Sutlej campaign, was wounded while acting as chief engineer at the siege of Moultan, and had a prominent share in the battle of Gujerat. As chief engineer of the Punjab, with the rank of col., he greatly developed the resources of the country. During the Indian mutiny he was chief engineer in sir Colin Campbell's army, and especially distinguished himself at the siege of Lucknow. For his services in the Chinese war of 1858 he was made maj.gen. and K.C.B. As commander of the expedition in Abyssinia in 1868 he achieved a brilliant success, both by his whole management of the short campaign and in the storming of Magdala, which ended it. On his return he received the thanks of parliament, an annuity of £2,000, and a peerage. In 1870 he was appointed commander-in-chief of the forces in India, and nominated a member of the Indian council. In 1876 he was made governor of Gibraltar.

NAPIER'S BONES, an invention of the celebrated Napier (q.v.) of Merchiston for the purpose of performing mechanically the operations of multiplication and division. The "bones" were narrow slips of bone, wood, ivory, or metal, about 3 in. long by $\frac{3}{10}$ths of an inch in breadth, and divided by transverse lines into nine compartments; each of these compartments being divided into two portions by a diagonal line running from the upper right hand to the lower left hand corners. The "bones were divided into sets, all those of one set having the same digit occupying the top compartment, and the several multiples of that digit occupying in order the eight lower compartments; when the multiple consisted of two figures, these were placed one on each side of the diagonal line. There was necessarily a set of bones for each digit. There was also another rod similarly divided into compartments, in which were placed the nine digits; this was called the *index-rod.* Multiplication was performed as follows; e.g., if 6795 is to be multiplied by 97834, four rods whose top digits were 6, 7, 9, 5 are selected and arranged in the order of the figures in the multiplicand, and the index-rod placed alongside them; the several figures of the multiplier are then sought for on the index-rod, the two lines of figures opposite each figure on the index are then added together diagonally, and the five sums thus obtained are arranged as follows:

9	61155
7	47565
8	54360
3	20385
4	27180

664782030 = the product required.

Division is performed in an analogous manner. The contemporaneous invention of logarithms for the same purpose of converting multiplication and division into addition and subtraction caused Napier's bones to be overlooked, and they are now scarcely ever used.

NA'PIERVILLE, a co. in s.w. Quebec, Canada, on the Grand Trunk railroad; 152 sq.m.; pop. '81, 10,511. Co. seat, Napierville.

NAPLES. The Italian provinces (formerly kingdom) of Naples and Sicily, or the Two Sicilies, occupy the south end of the Italian peninsula, and consist of the continental territory of Naples and the insula dependency of Sicily. The distinctive physical features of Naples and Sicily are noted under the names of the different provinces of Italy and in the article Sicily. They are favored by nature with a salubrious and almost tropical climate, unbounded fertility, and teeming population; and they present natural featurss of rare attractiveness. The rural population are an acutc, frugal, and laborious race, and form a strong contrast to their idle, and debased brethren of the towns. For statistics of products, exports, and population, see Italy and Sicily. Naples, in ancient times, was divided into numerous petty states independent of each other, and its inhabitants were of various races. Many of these states arose from Greek colonies, which had been founded in the country previous to the 7th c. B.C. The ancient historical importance of Naples is attested by the splendor of its cities, and the warlike renown of its population. On its conquest by the Romans, the great Neapolitan cities severally adopted the munici-

pal, federative, or colonist form of government, and gradually assimilated their laws and customs to those of their conquerors. After the downfall of the Western empire, Naples was seized by Odoacer, but soon afterward (490 A.D.) it was subjected by the Goths, and in the following century by the Lombards, who established in it various independent duchies, as Benevento, Spoleto, Salerno, Capua, etc. Most of these were overthrown by invading bands of Arabs, Saracens, and Byzantines, who were in turn expelled, and the whole country subdued by the Normans in the 11th century. The Normans subsequently erected Naples and Sicily into a kingdom, and established a new political, ecclesiastical, and military system. To the Norman dynasty succeeded that of the Hohenstaufen, whose rule was marked by an immense intellectual and social advancement of the people; but the vindictive enmity with which the papal see regarded this dynasty, led to the invasion of Naples by Charles of Anjou, who, notwithstanding the heroic resistance of king Manfred (q.v.), by the battle of Benevento (1266) annihilated the power of the Hohenstaufen. The ascendency of Charles of Anjou was further effectually secured by the treacherous defeat and decapitation (1268) of Konradin (q.v.), the last male-heir to the throne. By the *Sicilian Vespers* (q.v.) the island of Sicily was, however, wrested in 1282 from his grasp, and became an appanage of the Spanish crown. The predominance of the Neapolitan Guelph or papal party during the glorious reign of Robert I., who was the patron of Dante and Boccaccio, the depraved libertinism of his heiress and granddaughter Joanna, the fearful ravages committed by predatory bands of German mercenaries and by the plague, the futile attempts of the Anjou sovereigns to recover Sicily, and the envenomed feuds of rival claimants to the throne, are the leading features of the history of Naples during the rule of this dynasty, which expired with the profligate Joanna II. in 1435; and was followed by that of Aragon, which had ruled Sicily from the time of the Sicilian Vespers. During the tenure of the Aragon race, various unsuccessful attempts were made by the house of Anjou to recover their lost sovereignty; and the country, especially near the coast, was repeatedly ravaged by the Turks (1480). In fact, after the death of Alfonso, the first ruler of the Aragon dynasty, the country groaned under a load of misery. Wars, defensive and offensive, were incessant, the country was impoverished, and a conspiracy of the nobles to remedy the condition of affairs was productive of the most lamentable results, both to the conspirators themselves, and to the other influential Neapolitan families. In 1495, Charles VIII. invaded Naples, and though he was compelled to withdraw in the same year, his successor, Louis XII., with the treacherous assistance of Ferdinand (the Catholic) of Spain, succeeded in conquering the country in 1501. Two years afterward, the Spaniards under Gonsalvo di Cordova (q.v.) drove out the French, and the country from this time became a province of Spain. Sicily had previously (1479) been annexed to the same kingdom. During the two centuries of Spanish rule in Naples, the parliaments which had existed from the time of the Normans fell into desuetude, the exercise of supreme authority devolved on viceroys, and to their ignorance, rapacity, and oppressive administration may be solely ascribed the unexampled misery and abasement of this period. In the words of Sismondi, "no tax was imposed save with the apparent object of crushing commerce or destroying agriculture, and the viceregal palace and the tribunals of justice became public offices in which the highest dignities and most sacred interests of the state were openly bartered to the wealthiest bidder." During the Spanish rule, a formidable rebellion took place in 1647, headed first by Masaniello (q.v.), and afterward by Henry V., duke of Guise; the whole population of the province renounced their allegiance to their Spanish sovereigns, but the arrival of a new viceroy, who was equal to the occasion, resulted in the capture of the duke of Guise and the re-subjugation of the country. At length, during the war of the *Spanish Succession* (q.v.), Naples was wrested from Spain by Austria in 1707, and Sicily in the following year; but while Naples was secured to Austria by the treaties of Utrecht (1713) and Rastadt (1714), Sicily was handed over to Savoy by the former treaty. In 1720, however, both Sicilies were reunited under the Austrian rule, and in 1735 were given to Don Carlos, third son of Philip V. of Spain, who ascended the throne as Charles I., and founded the Bourbon dynasty. His reign was marked by equity and moderation; great reforms were effected in the administration of public affairs, science and literature were encouraged, and splendid works of public utility were erected throughout the kingdom. It was during his reign that Pompeii and Herculaneum were discovered. His successor, Ferdinand IV., followed in the course of legislative reform; but on the proclamation of the French republic (1789), his states were invaded by a French army, and the kingdom of Naples was erected into the Parthenopean republic (1799). Ferdinand retired with his court to Sicily, and for a brief period enjoyed the restoration of his sovereign rights in Naples; but a second invasion by Napoleon (1806) ended in the proclamation of his brother, Joseph Bonaparte, as king of Naples; and on this latter assuming the Spanish crown in 1808, that of Naples was awarded to Joachim Murat, brother-in-law of Napoleon. On the defeat and execution of Murat in 1815, the Bourbon monarch, Ferdinand IV., was restored. The liberal insurrectionary movements in Naples in 1821 and 1830 were the forerunners of the revolution of 1848; and in each case the party of progress was combated by the respective kings with ruthless severity, and perfidious concessions, to be canceled and avenged with sanguinary fury when the disarmed and credulous patriots were at the mercy of the sovereigns. See article GARIBALDI for the ultimate overthrow of the Bourbon dynasty in the kingdom of Naples,

and its subsequent annexation to the kingdom of Italy under king Victor Emmanuel; also articles FERDINAND II. and ITALY. For the history of Sicily previous to its annexation to and during its various separations from Naples, see SICILY.

NA'PLES (Ital. *Napoli*, anc. *Neapolis*), a city of southern Italy, capital of the province of Naples; is built partly at the base, partly on the slopes of two crescent-shaped acclivities on the famous bay of the same name. Pop. '81, 463,172. Lat. 40° 41′ 8″ n., long. 14° 15′ 5″ e. The wonderful beauty of the site and of the surrounding prospect, the delicious softness of the climate, and the clear atmosphere make Naples famed among the cities of the world. It is one of the chief centers of commerce and industry of Italy, possesses a very extensive mercantile shipping, and is one of the principal stations of Mediterranean steam navigation.

The public buildings of Naples are numerous and grand, but are devoid of architectural symmetry in consequence of the antiquity of their origin, and the irregularity of their site. Many of the old streets are paved with lava, and inconveniently narrow, with houses of great height. The modern streets, however, are spacious and splendid. The city is divided into the old and the new town, or the east and west crescents, by a lesser range of heights—viz., the Capodemonte, the St. Elmo, and the Pizzofalcone, terminating in the rocky promontory called the Castel dell' Ovo. In 1868 a land-slip destroyed a number of houses at the foot of Pizzofalcone. The eastern division of Naples is the most ancient and the most densely peopled; it contains the principal public structures, and is intersected by the splendid Via, or street, di Toledo. The western, or modern section, contains the famous Riviera di Chiaja, or the quay, a fine road running along the bay in a curved course of three miles, flanked on the right by a row of palaces, and bordered on the left by the beautiful pleasure-grounds of the Villa Reale, which lie between it and the sea, and of which the natural beauty is heightened by the interspersion of temples, fountains, and statuary groups amidst the acacia, myrtle, and orange groves. The public squares, or *larghi*, of Naples are adorned with fountains and obelisks; and within the precincts of the city there are several highly-prized springs both of fresh and mineral waters. The fortified castles are numerous. Amongst the principal are the Castel Nuovo, called the Bastile of Naples, somewhat similar to the Tower of London, and adorned with a fine triumphal arch, erected in honor of Alfonso of Aragon; the Castel dell' Ovo, so called from its oval or egg shape, standing on a promontory, and connected by a bridge with the main-land; the Castel Sant' Elmo, commanding a magnificent view from its ramparts, and formerly of immense strength; and the dismantled Castel del Carmine. The churches are upwards of 300, and many are rich in architectural and archæological interest. The cathedral dedicated to St. Gennaro (Januarius; q.v.) contains the celebrated phials in which the liquefaction of St. Gennaro's blood is alleged to take place on two annual festivals; it also contains the tombs of Charles of Anjou and of pope Innocent IV., besides numerous fine paintings and statues. The educational institutions of Naples embrace famous schools of surgery, law, and general science. A magnificent aquarium has been opened since 1871, with a zoological laboratory in which many distinguished foreign naturalists are at work. The philanthropical establishments are on an immense scale, and are richly endowed. There are also several theaters in the city, of which that of *San Carlo* (devoted to the opera) is one of the largest and most celebrated in Italy; but the characteristic theater of Naples is the *Teatro di San Carlino*, the headquarters of *Pulcinella* ("the Italian *Punch*"). There are four grand public libraries; and in the Museo Borbonico, Naples contains an unrivaled collection of art, comprising frescoes, paintings, mosaics, sculptures, bronzes, antiquities, coins, medals, inscriptions, and the renowned collection of precious objects excavated from Herculaneum and Pompeii. Water was introduced in 1884.

The environs of Naples, apart from their extreme beauty of scenery, are highly interesting. The locality which contains the tomb of Virgil, the disinterred towns of Herculaneum and Pompeii, Vesuvius (from an eruption of which Naples suffered in 1872), and the Roman remains, must possess an inexhaustible source of interest for scientific, antiquarian, and classical investigators. The modern villas of Naples are splendid and luxurious. One of the most striking features of Naples is its unique population and the universal publicity in which life is passed. The inhabitants forever swarm in the thoroughfares, where an incessant throng of venders, purchasers, and idlers intermingle with asses, mules, hand-carts, and conveyances, dazzling the eye with their brilliant variety of costume, and the pantomimic expressiveness of their frantic gestures and attitudes; while the ear is stunned by the shrill conflicting cries of the ambulatory venders of every conceivable commodity, by the piercing notes of the improvisatore's song, and the uproarious hilarity and high-pitched patois of the countless masses, whose sole abode appears to strangers to be the thronged public squares and streets. The popular language of Naples, which is a corrupt dialect of Italian and Spanish, is in prevalent use among all classes of society; it lends itself especially to the satirical and facetious squibs and compositions in which the Neapolitans excel. The popular Neapolitan songs in the native patois are exquisitely naïve and expressive in sentiment, and are set to popular melodies which exert a maddening charm over this southern populace. The physical condition of the lower classes of Naples, and especially of the lazzaroni (q.v.), has of late years sensibly improved both as regards raiment and lodging.

The name Naples (Gr. *Neapolis,* new city) had reference to an older town in the neighborhood, called originally Parthenope, and, after the foundation of the new town, Palæpolis (old town), which was situated most probably on the ridge called Posilipo, that separates the bay of Pozzuoli or Baiæ from that of Naples. Both towns were Greek settlements, apparently colonies from the neighboring Cumæ, joined by immigrants direct from Greece. In 327 B.C. Palæpolis was besieged and taken by the Romans, and thenceforth disappears from history; Neapolis submitted without resistance, and became a favored and faithful ally, or rather provincial city of Rome. It long, however, retained its purely Greek character and institutions; and there is evidence that the Greek language continued to be used, even in public documents, as late as the 2d c. of the Christian era. Naples was a flourishing and populous city during the Roman empire; and, notwithstanding the vicissitudes of the Gothic conquest of Italy, and the reconquests by the Byzantine emperors, it continued to be one of the most important and opulent places in Italy. About the 8th c. it threw off allegiance to the Byzantine emperors, remained independent till it fell into the hands of the Normans in 1140 A.D., and became the capital of the kingdom of Naples.

NAPLES, Bay of, an indentation of the Mediterranean sea on the s.w. coast of Italy, opposite the city of Naples, is 20 m. wide from cape Miseno on the n.w. to cape Campanella on the s.e., and from this line extends inland for about ten miles. The scenery is very beautiful. On the shores are many towns and villages; the prospect is bounded on the east by mount Vesuvius, and on the outskirts of the bay are the islands of Ischia and Capri.

NAPLES-YELLOW is a pigment used by artists. It consists of antimoniate of lead, and is obtained by the direct combination of antimonic acid and oxide of lead under the influence of heat.

NAPOLÉON BONAPARTE, Emperor of the French, was b. at Ajaccio, in the island of Corsica, Aug. 15, 1769. (For an account of the family to which he belonged, see Bonaparte, Family of.) At the age of 10 he entered the military school at Brienne, as a king's pensioner. Here he remained five years and a half. During that period he displayed a great aptitude and predilection for mathematics, history, and geography, and an indifference to merely verbal and literary studies. His manner was somber and taciturn, but as Bourrienne (who was his schoolfellow) says, this arose chiefly from the circumstance that he was a foreigner, poor, and unaccustomed to the use of French, which he first learned at Brienne. In Oct., 1784, he proceeded to the military school to complete his studies for the army, and in rather less than a year obtained his commission as sub-lieut. in the artillery regiment *de la Fère.* When the revolution broke out Napoléon was in garrison at Valence. He took the popular side, but in a quiet and undemonstrative way, for he did not love the boisterous enthusiasm of unmanageable mobs. When the armed rabble of Paris poured out to the Tuileries on the famous 20th of June, 1792, Napoléon, who was then in the city, followed the "despicable wretches" (as he called them), along with his friend Bourrienne; he saw them force the poor king to stick the red cap on his head, and smile fatuously from the windows of his palace. "It is all over henceforth with that man," said the young officer, and returned to Paris graver and more thoughtful than Bourrienne had ever seen him. After the scenes of Aug. 10 he left for Corsica, where gen. Paoli held the chief command. The excesses of the Septembrists and terrorists, however, induced Paoli to throw off his allegiance to the convention, and to seek the assistance of England. Napoléon was active but unsuccessful in his opposition to the designs of the general, and was obliged, along with his relatives, to flee from the island.

He now petitioned the convention for employment, and was sent to assist in the reduction of Toulon, with the rank of lieut.col. of artillery. The city was captured (Dec. 19, 1793) entirely through the strategic genius of Napoléon, and in the following February he was raised to the rank of brig.gen., and placed at the head of the artillery in the army of the south. Later in the year he was sent to Genoa, to examine the state of the fortifications of the city, and to discover the political disposition of the inhabitants. In the beginning of 1795 he was again in Paris seeking active employment, and thinking, from sheer ennui, of transferring his services to the sultan of Turkey. The convention was now in great peril, on account of the mutinous spirit of the arrondissements of the capital, and, on the suggestion of Barras, Carnot, Tallien, and others, Napoléon was made commander of the troops provided for its defense. On the 13th Vendémiaire (Oct. 4, 1795) the national guard, 30,000 strong, attempted to force its way into the Tuileries, where the convention was sitting, but was routed and dispersed by a terrible cannonade directed by the young artillery officer. Napoléon was immediately appointed to the command of the army of the interior. About this time he made the acquaintance of Josephine Beauharnais, whom he frequently met at the house of Mme. Tallien. Captivated by her elegant manners and amiable disposition, he proposed marriage to the graceful widow, and was accepted. The ceremony took place Mar. 9, 1796. A few days before he had been appointed to the supreme command of the army of Italy, and he was obliged to leave his bride almost at the altar. On his arrival he found the troops in a wretched condition. He had only 36,000 available men, and even these were half-starved and only half-clothed, to oppose to an Austrian and Piedmontese force of 75,000. Yet he

was not afraid to undertake the conquest of upper Italy. Leaving Nice at the close of March, he won his first victory over the Austrians at Montenotte (April 11), which opened the Apennines for him; three days later a second success at Millesimo separated the allied armies; and, finally, his victory at Mondovi (on the 22d) compelled Sardinia to implore peace. He now hoped to utterly crush the Austrian army under Beaulieu, and at the battle of Lodi (on May 10) nearly accomplished it. His opponent did not venture to defend the line of the Mincio, but hastily throwing a garrison into the city of Mantua, retreated into the Tyrol. Napoléon immediately entered Milan, and took possession besides of all the principal cities of Lombardy. Now began that system of enormous and unscrupulous plunder in northern and central Italy which gives something of a barbaric character to the conquests of the French. The directory gave orders that Napoléon should levy contributions from all the states which he had gratuitously freed, and according to his own account he sent to France not less than 50,000,000 francs. His officers and commissaries actually seized whatever they wished, provisions, horses, and all manner of stores; and because Pavia ventured to make some slight resistance to the shameful extortions of the republicans, Napoléon gave it up to havoc for 24 hours. A body of savans (including Monge, Berthollet, and others) were dispatched to Italy to superintend the spoliation of its artistic treasures; and both now and in the subsequent Italian campaigns pictures, statues, vases, and MSS. were carried off in great numbers, to gratify the vanity of the Parisian sight-seers. In this way Lombardy, Parma, Modena, Bologna, and the states of the church were savagely harried before the end of June—Pope Pius VI., in particular, being forced to submit to conditions of extreme rigor.

Meanwhile Austria had resolved to make another effort for the recovery of Lombardy. About the close of July marshal Wurmser advanced from Trent at the head of 60,000 men, forced Napoléon to raise the siege of Mantua, but was himself defeated, with the loss of all his cannon, near Castiglione (Aug. 5), and again at Bassano (Sept. 8), in consequence of which he was driven to take refuge within the fortress of Mantua with some 16,000 troops—the shattered remains of his 60,000. Austria, however, was not disheartened. A *third* army was dispatched in two divisions: 30,000 from Carinthia, under marshal Alvinzi; and 20,000 from the Tyrol, under gen. Davidowich. This was a terrible campaign for Napoléon; his veterans were exhausted, his new supports had not arrived; he himself was despondent, while the Austrians were fresh and hopeful. At first the latter were completely successful; but the great victory of Arcola, won by Napoléon (Nov. 17) after three days' fierce fighting, in which he lost nearly all his general officers, decided the fate of the campaign. His dispatches to the directory, penned about this period, show how thoroughly he apprehended the state of parties in Italy, and also how utterly indifferent he was to any considerations beyond those that advanced the interests of France. In Jan., 1797, a fourth campaign was commenced by Austria. At the head of 50,000 fresh troops, Alvinzi descended from the Tyrol, but was completely routed by Napoléon at Rivoli, on the 14th of the month; while, not long after, Wurmser was starved into surrender at Mantua. A *fifth* army was assembled on the Tagliamento, under the command of the archduke Charles; but his troops were mainly raw recruits, while those of Napoléon were inured to war and flushed with innumerable triumphs. In consequence he was forced to retreat, which, however, he did slowly and in good order, hoping to surround his opponent in the interior of the country. Napoléon's design was to march on Vienna, and he actually penetrated as far as Judenburg, in upper Styria, only eight days' march from the capital. The Austrian government at length was seized with alarm, made overtures of peace, and finally on Oct. 17, 1797, the famous treaty of Campo Formio was signed, by which Austria ceded the Netherlands, Lombardy, and some other smaller territories to France; while she herself obtained in return, through disgraceful treachery on the part of the victor, possession of the province of Venice. It is generally said that Napoléon's military genius was never more brilliantly displayed than in these early Italian campaigns. In ingenuity of plan, celerity of movement, audacity of assault, he far outshines all his adversaries; it is, moreover, but just to him to state, further, that he made desperate efforts to stop the excesses of the most scoundrelly commissariat in Europe; and that while in the main he showed no hesitation in carrying out the brigand-like orders of the directory, he does not appear to have appropriated a single penny to himself. It was power, not gold, that he cared for.

In Dec., 1797, Napoléon returned to Paris, where he was received with the utmost enthusiasm. At this time there was much talk, and probably some vague design, on the part of the directory, of invading England, and Napoléon was appointed commander-in-chief of the invading army. It has been thought, however, that this was merely a feint to mask the real design of the directory; viz., the invasion of Egypt, as perhaps a preliminary step to the conquest of British India. Be that as it may, an expedition against Egypt was resolved on by the directory; and on May 19, 1798, Napoléon sailed from Toulon, with a fleet containing 30,000 soldiers and a body of savans to investigate the antiquities of the country. He reached Alexandria on June 29. At this moment France was at peace with Turkey; the invasion of Egypt, a Turkish dependency, was therefore an act utterly unjustifiable, and reminds us not of European warfare, but rather of the irruption of a horde of barbaric Tartars. Napoléon, having landed his troops, captured Alexandria and marched on Cairo. The Mamelukes prepared resistance; but on July 21, at the battle of the pyramids, they were completely defeated, and the French became,

in a surface-way, masters of Egypt. Napoléon now entered the capital, and immediately commenced to reorganize the civil and military administration of the country; for he took a great, but also an ostentatious, pleasure in this sort of work. Meanwhile, on Aug. 2, Nelson had utterly destroyed the French fleet in Aboukir bay, and so cut off Napoléon from communication with Europe. A month later the sultan declared war against him. This was followed by disturbances in Cairo, which were only suppressed by horrible massacres. It was obviously necessary that Napoléon should go somewhere else. He resolved to meet the Turkish forces assembling in Syria; and in Feb., 1799, crossed the desert at the head of 10,000 men, stormed Jaffa on Mar. 7 after a heroic resistance on the part of the Turks, marched northwards by the coast, and reached Acre on the 17th. Here his career of victory was stopped. All his efforts to capture Acre were foiled through the desperate and obstinate valor of old Djezzar Pasha (q.v.), assisted by sir Sydney Smith with a small body of English sailors and marines. On May 21 he commenced his retreat to Egypt, leaving the whole country on fire behind him, and re-entered Cairo on June 14. It was during his absence that the savans made their valuable researches among the monuments of upper Egypt. About the middle of July the sultan landed a force of 18,000 men at Aboukir, who were attacked by Napoléon on the 25th, and routed with immense slaughter. But the position of the victor was far from comfortable, and he therefore resolved to return to France—especially as news had come to him of disasters in Italy and confusions in Paris. On Aug. 23 he sailed from Alexandria, leaving his army behind him under the command of Kleber; and after narrowly escaping capture by the English fleet, landed near Frejus on Oct. 9. He hastened to Paris, soon mastered the state of affairs, threw himself into the party of Sieyès, and overthrew the directory (q.v.) on the famous 18th Brumaire. A new constitution was drawn up, chiefly by Sieyès, under which Napoléon became first consul, with the power of appointing to all public offices, of proposing all public measures in peace or war, and the entire command of all administrative affairs civil and military. In a word, he was ruler of France; and though far from satisfied with the clumsy machinery of Sieyès's plan, he could afford to wait the future. About the end of Jan., 1800, he took up his residence in the Tuileries. The country was tired of revolutions, discords, and confusions; it was proud of its young leader, who seemed inspired but not enslaved by the ideas of his age, and who knew how to enforce obedience as well as to panegyrize principles. It therefore regarded his assumption of sovereign power with positive satisfaction. Napoléon displayed extraordinary vigor as an administrator, recruited the national treasury by various sagacious expedients, repealed the more violent laws passed during the revolution, such as punishment for matters of opinion, reopened the churches, and terminated by policy the Vendean struggle. But he knew well that his genius was essentially military, and that his most dazzling and influential triumphs were those won on the battle-field. France was still at war with Austria, and he resolved to renew the glories of his first Italian campaigns. Leaving Morcau in command of the army of the Rhine, he assembled, with wonderful rapidity and secrecy, an army of 36,000 men on the shores of the lake of Geneva, and on May 13 (1800) began his magnificent and daring march across the Alps. Almost before the Austrian general, Mclas, was aware, Napoléon had entered Milan (June 2). Twelve days afterwards was fought the fiercely contested yet decisive battle of Marengo, which compelled the Austrians to resign Piedmont, with all its fortresses, and (for the second time) Lombardy to the French. Later in the year hostilities were recommenced; but the Austrians, beaten by Moreau in Germany (at Hohenlinden, etc.) and by Napoléon in Italy, were at last forced to make peace; and on Feb. 9, 1801, signed the treaty of Lunéville, which was mainly based on that of Campo Formio. In the course of the same year France and England also made peace; but the treaty (known as that of Amiens) was not definitively signed till Mar. 27, 1802. Not less important for the consolidation of affairs in France was the famous *concordat* (q.v.) between Napoleon and Pope Pius VII., also concluded in 1801. In Jan., 1802, Napoléon became president of the Cisalpine republic; and on Aug. 2 following was declared consul for life by a decree of the French senate.

Meanwhile Napoléon was busy superintending the drawing up of a code of civil laws for France. He assembled the first lawyers in the nation, under the presidency of Cambrérès, and frequently took part in their deliberations; the results of their labors were the *code civil des Français*, *code de procédure*, *code penal*, and *code d'instruction criminelle*, besides commercial and military codes, all of which often go loosely under the name of the *code Napoléon*. The first of these is an admirable production, and is in force to the present day. Considerable attention was besides paid to such branches of education as were likely to promote efficiency in the public service. Mathematics, physical science in all its departments, engineering, etc., were as vigorously encouraged as philosophy, ethics, and political speculation were discouraged. But the best proof that Napoléon wanted not an educated people, but only active and expert tools and agents, was the indifference that he manifested to primary and elementary education. In a population of 32,000,000, the number of pupils under 10 years is given by Fourcroy at only 75,000. The internal government was the acme of despotic centralization. Napoleon appointed all prefects of departments and all mayors of cities, so that not a vestige of provincial or municipal freedom remained. He ruled France as he ruled the army of France, and was already an emperor in almost everything but the name.

Peace between France and England did not last long. Napoléon's policy in Italy irritated the British government, and, as remonstranees were ineffectual, war was declared against France May 18, 1803. The English fleet seoured the seas, paralyzing the commerce of Franee; while Napoleon threatened to invade England, and assembled a large army at Boulogne. So utterly did he misconceive the character and condition of Englishmen that he felt sure (by his own statement) he should be weleomed as a liberator by the people. While these warlike preparations were going on occurred the dangerous conspiracy of the Chouan chief, George Cadoudal (q.v.), Piehegru (q.v.), Moreau (q.v.), and others. Its diseovery (Feb., 1804) alarmed Napoléon excessively, and led to what has been considered one of the blaekest deeds in his earcer—the murder of the duke d'Enghien (q.v.) on Mar. 20 following. He now appears to have felt it necessary to assume the title of emperor. France, he alleged, wanted an empire as a symbol of permanent security. An appeal was made to the nation. Upwards of 3,000,000 votes were given in favor of the proposed change in the form of government; only 3,000 or 4,000 against it. But where there is no municipal freedom, one does not know what value to put on votes. On May 18 Napoléon assumed the title of emperor at St. Cloud, and was crowned by, or rather in the presence of the pope (for Napoléon rudely crowned himself), on Dec. 2. In the following summer (May 26), he was also crowned king of Italy, in the great eathedral of Milan; and Eugène Beauharnais, his step-son, was appointed to the office of viceroy.

This poliey of aggrandizement, which set at naught the conditions of the treaty of Lunéville, alarmed the other nations of Europe, especially Austria, who saw her Italian possessions seriously threatened. In 1805 a coalition was formed between England, Russia, Austria, and Sweden, mainly through the persevering policy of the first of these countries; and war again broke out in the month of September. Napoléon aeted with amazing celerity. Concentrating his widely seattered forees at Mainz, he marched at once aeross Bavaria, compelled gen. Maek to capitulate at Ulm with 20,000 men (Oct. 17), and on Nov. 13 entered the capital of Austria. France was electrified; the rest of Europe was thunder-struek. But a more glorious triumph was yet to eome. The Russian army was already in Moravia, under the immediate command of the emperor Alexander I., and was there being joined by the seattered Austrian troops. Napoléon did not lose a moment. Hurrying north, he gave battle to the allies at Austerlitz on Dee. 2. The contest was tremendous, but the victory was complete. Napoléon's opponent were utterly crushed; and next day the Austrian emperor sought an interview, and sued for peaee. A treaty was signed at Presburg on Dec. 26, by which Austria ceded to France all her Italian and Adriatic provinees; other changes effeeted by it were, the dissolution of the old German empire and the formation of the *confederation of the Rhine* (q.v.).

In Feb., 1806, a Freneh army conquered Naples, and the crown was conferred by Napoléon on his brother Joseph; in the following June another brother, Louis, was made king of Holland. Prussia now, when it was too late, assumed a hostile attitude. She had hung off, partly through fear and partly through selfishness, from the great anti-Freneh coalition of the previous year, and now, when circumstanees were almost hopelessly adverse, she madly rushed against her colossal enemy. Austria, with more magnanimity than prudence, lent her help, but the star of Napoléon was still in the ascendant. The battle of Jena (Oet. 14) absolutely annihilated the power of Prussia; five days later Napoléon entered Berlin, whence he issued (Nov. 21), his celebrated "decrees" against British commerce, hoping to ruin her by shutting out her ships from every harbor in Europe. His expectations, it need hardly be said, were disappointed. His policy well-nigh ruined the commerce of his own and other countries, but it only increased the prosperity of England. Her fleets and cruisers swept the seas; nothing could be got from the colonies save through her, and the merchants of the continent were obliged—in order to supply their customers as before—to let her carry on a vast contraband traffic. See ORDERS IN COUNCIL.

After the capture of Berlin, Napoléon proeeeded northwards to encounter the Russians, who were advancing to the help of Prussia. On his way he summoned Poland to rise, but only with partial suecess. At Pultask (Dec. 18, 1806) and at Eylau (Feb. 8, 1807) the French were beaten and driven back on the line of the Vistula; but after some months he received heavy re-enforeements, and on June 13 fought and won the great battle of Friedland, which led to the treaty of Tilsit, signed on July 7. By a secret article of this treaty, Russia promised to close her ports to British vessels. It is important to observe here that, as the military triumphs of Napoléon increased, the civil and political liberties of his subjects diminished. Conseqnent on the treaty of Tilsit, a decree of the imperial senate abolished the tribunate—the only political body in France that preserved the semblance of national self-government. In August, Napoleon created his brother Jerome sovereign of Westphalia—having patched up a kingdom for him in his usual unscrupulous way—and soon after entered on a war with Portugal—the beginning of the great peninsular war. The occasion of the war was the refusal of the prince-regent of Portugal to carry out the Berlin decree in regard to British shipping. In Mar., 1808, occurred that extraordinary instance of trepanning at Bayonne by which the whole royal family of Spain fell into the hands of Napoléon; and in the following July his "dearly beloved brother" Joseph was ordered to exchange the throne of Naples

for the "crowns of Spain and the Indies." His successor was the "handsome swordsman" (*beau sabreur*), Joachim Murat. Spain rose in insurrection, and an English force, under sir John Moore, was dispatched to its assistance. Napoléon invaded the country about the close of October, defeated the Spanish forces, and captured Madrid (Dec. 4). But his presence was urgently needed elsewhere, and he was forced to let Soult and other generals conduct the war in the peninsula. Austria, again irritated and alarmed at his aggressive policy, especially in Italy (where he had seized Tuscany and the states of the church), once more prepared for war, which broke out in the spring of 1809. Her army of Germany, commanded by the archduke Charles, was in splendid condition; but still fortune was adverse. Napoléon hurried into Bavaria, routed the archduke at Eckmühl (April 22), compelled him to retreat into Bohemia, and on May 12 entered Vienna for the second time. But the struggle was not over. The archduke rallied his scattered forces, worsted Napoléon in the terrible conflicts of Aspern and Essling (May 21 and 22), and drove him to take refuge for a time on an island of the Danube. The battle of Wagram (July 6), however, once more prostrated, or at least intimidated, Austria; and on Oct. 14 she signed the peace of Schönbrunn.

Napoléon appears to have now come to the conclusion that he could only put a stop to the hostile machinations of the old legitimate dynasties by intermarrying with some one of them. Besides, his wife Josephine had no children, and he was ambitious of perpetuating his power in his family. With that callousness to everything except his own interests, which is a prominent feature of his character, he immediately proceeded to divorce her. The act of divorcement was solemnly registered on Dec. 16. Less than three months afterwards he married Maria Louisa, archduchess of Austria. He was now at the zenith of his power, and so, according to the old Greek belief, Nemesis was on his track. What caused his ruin was really that outrage on civilization, the Berlin decrees. Russia found it impossible to carry it out, without permanent injury to her great landowners; Sweden and other countries were in a similar predicament. This led to evasions of the decree, and these, again, involved Russia particularly in further complications, until finally, in May, 1812, Napoléon declared war against her and, in spite of the advice of his most prudent counselors, resolved to invade the country. Every one knows the dreadful history of the Russian campaign. Napoléon—wringing contingents from all his allies, Germans, Austrians, Italians, Poles, and Swiss—concentrated between the Vistula and the Niemen an army of half a million of men. The vast horde crossed the latter river (June 24 and 25) in three divisions, captured Wilna (June 28), and ravaged Lithuania. The Russian generals retreated before the invading host, deliberately wasting the country and carrying off the supplies, but avoiding, as far as possible, all engagements; their design being to surround Napoléon in the heart of the country, and by the help of famine and the rigors of a northern winter to annihilate him in his hour of weakness. Napoléon followed up the retreating foe with reckless resolution. He risked everything upon the chance of striking some overwhelming blow. The horrors of his march—in Lithuania alone 100,000 dropped off (dead, sick, or captured by the swarms of Cossacks that hung upon his flanks)—are too familiar to require description. When he reached Smolensk (Aug. 16), the Russians had just left it—on fire. Three weeks or so later he made up on the enemy at Borodino, where an obstinate and bloody battle was fought (Sept 7). The French remained in possession of the field, but of nothing else. A week after Napoléon entered Moscow, hoping to find rest for a time in the ancient metropolis of the country. But the city was deserted by its inhabitants; and on the 16th a fire broke out, which raged till the 19th and left Moscow a heap of ruins. After five weeks' stay, Napoléon was obliged to commence his retreat (Oct. 19). His army was reduced to 120,000 men. The winter set in much earlier than usual, and he had to return through the very districts which had been wasted on his advance. When he left Smolensk (Nov. 14), he had only 40,000 fighting-men; when he crossed the Beresina (Nov. 26 and 27), he had not more than 25,000. With the excuse—which was in itself no doubt true—that his presence was urgently needed in France, he now abandoned the miserable remains of his army; and on Dec. 5, leaving Murat in command, set out in a sledge for Paris, where he arrived on the 18th of the same month. He instantly set about a fresh conscription; and in the spring of 1813 marched into Germany at the head of 350,000 men; but the Russian campaign had broken the spell of terror which his name had till then exercised. The spirit of all Europe was thoroughly roused. A conviction was, somewhat unconsciously, seizing every mind (at the close of the campaign of 1814 even France shared it) that the world had had "enough of Bonaparte" (*assez de Bonaparte*). Prussia, in particular, was burning to wipe out the disgrace of Jena and all the bitter humiliations to which she had been subsequently subjected. The victories of the British in Spain, the fame of which was spreading all over the continent, also proved to her that French soldiers *could* be beaten, not once or twice only, but through whole campaigns. An alliance was formed between the king of Prussia and the emperor Alexander. At first Austria remained neutral, but afterwards she joined the coalition. Napoléon's military genius, it has been often remarked, never showed to greater advantage than in this and the next campaign, which cost him his crown and his liberty. He was for some months successful in winning battles—at Lützen (May 2), Bautzen (May 21), and Dresden (Aug. 24, 25, and 27); but the invincible temper of the allies, who knew that he was playing his last card, made these victories almost fruitless. They were convinced that

one grand defeat would neutralize all his triumphs. This was inflicted, after several minor defeats, at Leipzig—the great *battle of nations,* as it has been called (Oct. 16, 18, and 19). The result justified their expectations—Napoléon was hopelessly ruined! He commenced his retreat towards France, followed by the allies. When he recrossed the Rhine, he had only 70,000 or 80,000 men left out of his 350,000. All the French garrisons in the Prussian towns were compelled to surrender. Napoléon appeared at Paris Nov. 9; and though great discontent prevailed in the country, and a spirit of opposition showed itself even in the legislative body, the senate decreed, at his bidding, another conscription of 300,000 men, with which Napoléon began, in Jan., 1814, to attempt to drive the allies out of France. The skill and energy which he displayed were extraordinary, but they only marked the intensity of his despair. On Mar. 30 the allied forces captured, after a severe engagement, the fortifications of Paris; next day the emperor Alexander and the king of Prussia entered the city, *amid the shouts of the populace;* on April 4 Napoléon abdicated at Fontainebleau. He was allowed to retain the title of emperor, with the sovereignty of the island of Elba, and an income of 6,000,000 francs, to be paid by the French government. A British ship conveyed him to Elba, where he arrived on May 4.

After a lapse of ten months, most of which was spent in intrigues, Napoléon made his escape from the island, landed near Frejus on Mar. 1, 1815, and appealed again to France. The army went over to him in a body, and several of his marshals, but the majority remained faithful to Louis XVIII. On Mar. 20 he reached Paris, reassumed the supreme power, promised a liberal constitution, and prepared once more to try the fortune of battle with the allies. At the head of 125,000 men, he marched (June 15) towards Charleroi, on the Flemish frontier, where the English and Prussian forces were assembling. The duke of Wellington, who, the year before, had completed the deliverance of Spain, was appointed by the congress of Vienna commander-in-chief of the armies of the Netherlands. The campaign lasted only a few days. On the 16th Napoléon defeated the Prussians, under marshal Blücher, at Ligny, which compelled Wellington to fall back on Waterloo, where, on the 18th, was fought the most memorable and decisive battle of modern times. It resulted in the utter and irretrievable ruin of Napoléon. The despot, who knew what awaited him—for France had *not* recalled him from Elba; he came at the desire of a faction, whose interests were identical with his—returned to Paris. The house of representatives fiercely insisted on his abdication. He did so (June 22) in favor of his son, Napoléon II.; they further demanded that he should leave the country forever, and he retired to Rochefort, with the design of embarking for the United States. On July 7 the allies again entered Paris, and refused to acknowledge the acts of the French provisional government. Napoléon, who saw that he could not escape either by sea or land, voluntarily surrendered (July 15) to capt. Maitland of the *Bellerophon,* claiming the protection of British laws. It was, however, resolved by the British government to confine him for life on the islet of St. Helena, a lonely rock in the southern Atlantic, 1000 miles from the coast of Africa. He was conveyed thither by admiral Cockburn, and landed at St. Helena Oct. 16, 1815. The remainder of his life was politically insignificant. His chronic quarrels with his governor—or *jailer,* as the French prefer it—sir Hudson Lowe; his conversations with friends and visitors about his past career; his deliberate attempts to falsify history in his writings, are familiar to every one. After more than a year of bad health, he expired, May 5, 1821. He was buried with military honors. In 1840 his remains were removed to France, and deposited in the *Hôtel des Invalides.* See BONAPARTE, FAMILY OF.

NAPOLÉON II., son of Napoléon Bonaparte. See REICHSTADT, DUKE OF.

NAPOLÉON III., nephew of Napoléon Bonaparte. See LOUIS NAPOLÉON.

NAPOLÉON, or, in full, NAPOLÉON JOSEPH CHARLES PAUL BONAPARTE, is the son of Jerome, king of Westphalia, and was b. at Trieste in 1822. When the insurrection broke out in the Romagna in 1831, he was staying in Rome with his grandmother, Mme. Letitia Bonaparte, but was forced to leave the city for Florence on account of his cousins (see LOUIS NAPOLÉON) being implicated in the revolutionary disturbances. He was educated at a boarding-school in Geneva, and at the military school of Ludwigsburg, in Würtemberg, completing his studies in 1840, after which he traveled for five years in Germany, England, and Spain. In 1845 he obtained permission to visit Paris under the name of the comte de Montfort; but his relations with the democratic party and his advanced political opinions rendered him suspected by the government, who ordered him to quit the country. He, however, again made his appearance on the eve of the revolution of Feb., 1848. After the fall of Louis-Philippe he offered his services to the provisional government, and was elected by the Corsicans a member of the constituent assembly, where he voted with the moderate republicans. He held for a short time, in 1849, the office of minister-plenipotentiary at Madrid. After the *coup d'état* he withdrew into private life; but on the restoration of the empire he reappeared to share in the honors that now fell thickly on his family. By a decree of the senate, Dec. 23, 1853, he was pronounced a French prince, with the right to a place in the senate and the council of state; at the same time he received the insignia of the grand cross of the legion of honor, and—though he had not served—the rank of gen. of division. In the Crimean war he commanded a division of infantry reserves at the battles of Alma and

Inkerman, but soon after returned to France, on the plea of ill-health. Napoléon was president of the imperial commission of the Paris exhibition in 1855. In 1858 he was appointed head of the ministry for Algiers and the colonies, but held the office only for a short time. During the same year he married the princess Clotilde, daughter of Victor Emmanuel, and in the Italian war of 1859 commanded the French army of reserve in the south of Italy, but was not engaged in actual hostility. In 1861 he made a speech in the senate reflecting on the Orleans family, for which he was challenged by the duc d'Aumale. The challenge was not accepted, much to the disgust of the French army. Napoléon was president of the French commission at the London exhibition of 1862. In 1865 he resigned several public appointments, owing to a reprimand from the emperor about a speech. Afterwards, however, he was intrusted with many delicate missions, and urged the emperor to a liberal policy. In 1876 he was returned to the French assembly for Corsica, but in 1877 was rejected. In 1880 he publicly applauded the decrees against the religious orders, but in 1883 posed as a champion of the church in a manifesto calling for the plebiscite. He was arrested, but released after a month's imprisonment.

NAPOLEON-VENDEE, Bourbon-Vendée, or La Roche sur Yon, a t. of France, the capital of the department of Vendée, pleasantly situated on a hill on the right bank of the Yon, 37 m. s. from Nantes. The town has no manufactures and little trade, but derives its importance chiefly from its being the seat of departmental administration. The town contained only 800 inhabitants when Napoleon I. selected it for the capital of the department, granted great sums for its improvement, and called it *Napoleon-Vendée,* changed to *Bourbon-Vendée* at the restoration of the Bourbons, the former name coming again into use under Napoleon III. It is now known as *La Roche sur Yon.* Pop. '76, 9,021.

NA'POLI DI ROMANI'A. See Nauplia, *ante.*

NARA, the ancient capital of Japan during the reign of seven mikados, four of whom were women. This most interesting town lies 20 m. e. of Ozaka, and contains a pop. of 21,000—one-tenth of its former number. From 708 to 782 Nara was the national seat of art, letters, religion, and government, being visited by envoys from China, Siam, India, and Corea. Libraries, monasteries, and temples flourished. Among the relics of the past extant are the monster bell, 13½ ft. high, 9 ft. in diameter, 8 in. in thickness, and weighing 36 tons; and the colossal gilded bronze image of Buddha, 53 ft. high. The industries of Nara in the manufacture of fans, silk, lacquer, cloisonné enamel or porcelain, etc., are still famous. Mikasa Yama (the hill of the three hats), near by, is a natural feature, famous in native poetry and art, being frequently depicted on fans, cabinets and scroll paintings.

NARAKA is the hell of the Hindus. Manu (q.v.) enumerates 21 hells or divisions of Naraka, and gives a general description of the tortures which await the impious there. The Purânas, however, are more systematic. The Vishnu-Purâna, for instance, not only names 28 such hells, but distinctly assigns each of them to a particular class of sinners. Thus, a man who bears false witness is condemned to the hell *Raurava* (i.e., fearful); the murderer of a Brâhman, stealer of gold, or drinker of wine, goes to the hell *Súkara* (i.e., swine), etc. Besides these twenty-eight which the Purâna knows by name, we are told of "hundreds and thousands of others in which sinners pay the penalty of their crimes."

NARBONNE, a t. in the s. of France, in the department of Aude, 55 m. s.w. of Montpellier, on a branch (La Robine) of the canal du Midi. It is the *Narbo Martius* of the Romans; but there is reason to believe that it was well known to the Greeks 500 years before the Christian era. It was colonized by the Romans 118 B.C., and probably got the designation Martius from Q. Marcius Rex, one of the consuls at the time. Situated only about 8 m. from the sea, on the direct road into Spain and into the basin of the Garonne, Narbonne was in early times a place of great commercial prosperity. It was the second settlement founded in south Gallia by the Romans, and was considered by them an important acquisition, both for its strength and as the key to the road into Spain. Under Tiberius it flourished greatly, the arts and sciences being cultivated with success, and its schools rivaling for a long time those of Rome. About 309 A.D. it became the capital of Gallia Narbonensis, and contained among other buildings a capitol, theater, forum, aqueducts, triumphal arches, etc. It was taken in 719 by the Saracens, who planted here a Moslem colony, and destroyed the churches. In 859 it fell to the arms of the Northmen. During the 11th and 12th centuries it was a flourishing manufacturing city, but subsequently it fell into comparative decay, and is now entirely destitute of any monument of its former splendor. A considerable number of architectural fragments—as capitals, marble slabs with inscriptions, friezes, etc.—have been found, and have been grouped into a collection of antiquities.

The present very dirty town contains one imposing building, the cathedral of St. Just, founded in 1271, but still unfinished. The honey of Narbonne is the best in France, both for color and flavor. Manufactures are carried on to some extent. Pop. '81, 25,625.

NARCIS'SUS, according to a Greek fable, was the son of the river god Cephissus and of the nymph Liriope or Liriœssa of Thespiæ, in Bœotia. He was a youth of extraordinary beauty, of which he was excessively vain; and for this he was punished by

Nemesis, by being made to fall in love with himself on seeing the reflection of his own face in a fountain. He died of this love-sickness; and on the place where he died sprung up the flower which bears his name. The story of Narcissus, finely narrated by Ovid, is of comparatively late origin.

NARCISSUS, a genus of plants of the natural order *amaryllideæ*, having a perianth of six equal petal-like segments, and a bell-shaped corona of various magnitude. The species are natives of the s. of Europe, the n. of Africa, and the temperate parts of Asia. The common daffodil (q.v.) is the only one which can be regarded as truly a native of Britain. Many are cultivated in gardens for the sake of their beautiful and often fragrant flowers, which in general appear early in the season. Some of them are known by the names of daffodil (q.v.) and jonquil (q.v.). The name narcissus is popularly restricted to those which have flat—not rush-like—leaves, and a short, not bell-shaped corona. Of these, one of the best known is the poet's narcissus (*N. poeticus*), with generally one-flowered scape, the flower white and fragrant, the corona with a deeply-colored border; others, with one or two flowers on the scape, are in common cultivation.—The Polyanthus Narcissus (*N. Tazetta*) has a number of flowers on the scape. It grows wild in stony places near the Mediterranean and eastwards to China. Many varieties of it are in cultivation. It is not only grown in gardens and green-houses, but in water-glasses, like the hyacinth. It is very common in gardens in India, where it is highly esteemed as a flower. The narcissi in general are propagated either by seed, or by offset bulbs. They succeed best in a rich light soil.

NARCOTICS (Gr. *narkē*, stupor) are remedies which, in moderate doses, lessen the action of the nervous system. Their full operation is sleep or coma. Opium is the type from which most descriptions of this class of medicines have been drawn; but although most narcotics more or less resemble opium in their action, almost every one presents some peculiarity in the way in which it affects the system. These medicines are primarily stimulating, especially when given in small or moderate doses; but this stage of their action is comparatively short; and when the dose is large the excitement is scarcely perceptible. Their power of inducing sleep has procured for them the names of hypnotics and soporifics; while many of them are termed anodynes, from their possessing the property of alleviating pain. Next to opium, henbane, Indian hemp, and aconite may be regarded as the most important narcotics. It has been already mentioned that there are differences in the mode of operation of the different members of this class. "Some dilate, while others contract the pupil; some appear to concentrate their sedative action more particularly upon the functions of the encephalon, others upon the contractile power of the alimentary and bronchial tubes, while a strict distinction is to be drawn between those which occasion constipation and those which do not; all these things being of great practical importance."—Ballard and Garrod's *Elements of Materia Medica*, p. 13.

Narcotics are usually administered either with the view of inducing sleep or of alleviating pain or spasm. As, however, their action is much modified by a variety of circumstances—such as age, idiosyncrasy, and prolonged use—they should be administered with extreme caution; and, as a general rule, only under competent advice. The various quack medicines for children which are known as *carminatives*, *soothing syrups*, etc., contain some form of opium, and are a fertile cause of the great mortality that occurs in early life, especially among the poorer classes.

It is almost unnecessary to add that all the narcotics when taken in excess are poisonous.

NARCOTINE ($C_{46}H_{25}NO_{14}+2Aq$) is one of the organic bases or alkaloids occurring in opium, in which it usually exists in the proportion of 6 or 8 per cent. It is nearly insoluble in water, but dissolves readily in alcohol, ether, and chloroform. Its ethereal solution, when submitted to spontaneous evaporation, yields it crystallized in colorless acicular groups or in rhombic prisms. A mixture of concentrated sulphuric and nitric acids produces a blood-red color with narcotine and its compounds. Narcotine possesses very slight alkaline properties; its salts do not readily crystallize, and are even more bitter than those of morphia, although the substance itself is almost tasteless. When first discovered (in 1803), it was supposed to be the stimulant principle of opium; but in reality it possesses very little activity. It has been prescribed in gradually increased doses up to a scruple, without the least injury. Its sulphate has been used in India as a substitute for quinine; and nearly 200 cases of intermittent and remittent fevers, treated by it with success, have been published by Dr. O'Shaughnessy.

NARD and **NARDOS'TACHYS.** See Spikenard.

NAR'DO (anc. *Neretum*), a t. of South Italy, in the province of Lecce, 8 m. n.n.e. from Gallipoli. Nardo has manufactures of cotton goods and snuff, from cotton and tobacco grown in the neighborhood. The surrounding country abounds in olive plantations. Pop. about 8,500.

NARDOO, *Marsilea quadrifida*, a plant of the acotyledonous natural order *marsileaceæ* (q.v.), the only plant of that order which is used in any way by man. It has but recently become known to botanists. It is found in Australia, and affords important supplies of food to the natives of some regions; it has also been of great use to some recent exploring-

parties. It grows in places occasionally covered with water; vegetating while moisture abounds, and then exhibiting abundance of green clover-like foliage, the leaves consisting of three leaflets at the top of a stalk some inches in length. When the water dries up the remains of the plants are often covered with dried mud. It is then that the spore-cases are gathered for food. They are oval, flattened, about an eighth of an inch in length, hard and horny, and requiring considerable force to pound them when dry, but becoming soft and mucilaginous when moistened. The spore-cases, pounded with their contents, are made into cakes like flour.

NAR'DUS, a genus of grasses, having a simple spike, spikelets all on one side, no glumes; each spikelet consisting of one floret, which has two paleæ, the outer ending in a long point. *N. stricta* is one of the most common of British grasses, growing in dry elevated situations, and very characteristic of them. It grows in tufts, and is often called MAT-GRASS. It is perennial, purplish, short, rigid, and very worthless, as almost no animal but the goat will eat it.

NARES, EDWARD, D.D., 1762–1841; b. England; son of sir George Nares and cousin of Robert Nares; was educated at Christ church, Oxford, and became a fellow of Merton college in 1788. Ten years later he became rector of Biddenden, in Kent; and in 1814 regius professor of modern history at Oxford. He wrote, among numerous works: *On the Plurality of Worlds; Discourses on the Three Creeds; Evidences of Christianity; Elements of General History; Heraldic Anomalies; Memoirs of the Life and Administration of William Cecil, Lord Burghley;* and a novel entitled *Thinks I to Myself,* which passed through several editions in 1811.

NARES, JAMES, 1715–83; b. Stanwell, Middlesex, England; studied music under Bernard Gates and the famous Dr. Pepusch at King's chapel, London. In his nineteenth year he became organist of the York cathedral. He published *Lessons for the Harpsichord* in 1748; was made doctor of music at Cambridge in 1755; was appointed organist to George II., and removed to London in 1756; was made master of choristers in 1757, and resigned the position in 1780. He published *Catches, Canons, and Glees,* dedicated to the earl of Mornington, 1778; also his *Twenty Anthems in Score,* which still continue in use. His works show a thorough knowledge of the science of music.

NARES, ROBERT, 1753-1829; b. England; son of James Nares, an organist and musical composer, studied at Oxford; in 1778 took orders, and soon became rector of Sharnford, Leicestershire, and preacher at Lincoln's Inn. As critic, essayist, and theologian he held a high rank among the writers of his time; was archdeacon of Stafford 1799, rector of St. Mary's, Reading, canon of Lichfield, and for sometime rector of Allhallows church, London. Associated with the rev. William Beloe he founded the *British Critic,* which he assisted in conducting for four years as a high-church literary review, conservative in principle, and opposed to the dogmas of the sympathizers with the French revolution. He was at one time assistant librarian of the British museum. He was a contributor to the *Classical Journal,* and published, in 1784, *Elements of Orthoepy,* and in 1805, *Chronological View of the Prophecies relating to the Christian Church:* One of his most important works is *A Glossary of Words, Phrases etc., in the Works of English Authors of the Age of Queen Elizabeth,* new edition 1861. In 1815 he published the *Veracity of the Evangelists Demonstrated.* In 1823 he was vice-president of the royal society.

NA'REW, a river of w. Russia, an affluent of the Bug, rises in the government of Grodno, and flows w.s.w to the main stream, which it joins at Sierock, after a course of 294 miles. The waters of the Narew are about as great in volume as those of the Bug. It is navigable to Tykoczin, 150 m. from its mouth.

NARNI, a t. of the province of Perugia, Italy, about 45 m. n.e. of Rome, 8 m. from the city of Ferni; situated on a precipitous hill on the left bank of the Nar. The Romans colonized the place and gave it the name of Narnia about 300 B.C., and it was a military post on the Flaminian way. Ruins of a massive marble bridge built by Augustus and of a very ancient aqueduct are still to be seen. Narni has been the seat of a bishoprie since 360, and the cathedral dates from the 13th c.; the only other buildings of interest are the castle and convents. In the 9th c. the town was seized by the duke of Spoleto, and in the middle ages was burned and laid waste. Pope John XVIII. and the emperor Nerva, 98 A.D., were natives of Narni.

NA'RO, a t. of Sicily, in the province of Girgenti, and 14 m. e. of the town of that name. It has 10,253 inhabitants, who trade in oil, wine, and sulphur. Numerous tombs, medals, and other antiquities have been found here.

NARRAGANSETT BAY, an inlet of the Atlantic ocean, e. of Kent and Washington counties, R. I., extending n. 28 m. to Bullock's Point, 6 m. from Providence, and w. from Seconnet to Point Judith, 12 m., and with a width never less than 2 miles. The Pawtucket, Pawtuxet, Providence, and Taunton rivers empty into it, and it contains a number of islands, of which Rhode Island, Providence, and Canonicut are the most important. Newport is at its s. extremity; Bristol and Warren are on its shores. It is navigable by large vessels to Providence. The n. part is called Providence bay.

NARRAGANSETT PIER, a village in s. Rhode Island, in the township of South Kingston, Washington co.; pop. '80, 521. It is 7 m. e. of Kingston, the county-seat,

about 26 m. s. of Providence, and 8 m. s.w. of Newport; delightfully situated on the w. shore, near the mouth of Narragansett bay, and has an excellent beach. It is a popular summer resort. Excellent facilities for fishing and boating are amply provided, and it is celebrated for its fine drives and scenery. It has a number of elegant private summer residences, and 6 or more hotels. Three miles from the pier are Narragansett heights, 400 ft. above the bay, commanding a magnificent view, and on the rising ground near the most fashionable hotel is Silver lake, a beautiful sheet of water embowered in trees. A line of horse-cars connects the heights with the beach. Steamboats run between Providence and this place, and a newspaper is published here.

NARRAGANSETTS, a tribe of Indians that inhabited Rhode Island and the western shore of Narragansett bay; after whom the latter was named. They were originally a part of, and spoke the dialect of the Algonquins. They were friendly towards the colonists, their wars being waged generally against other Indian tribes. Canonicus, their chief sachem, warmly befriended Roger Williams, and gave him a large tract of land. In 1636 king Philip, chief of the Pequots, sought alliance with the Narragansetts, which Roger Williams prevented by appearing, at the risk of his life, in the camp of the latter while the Pequots were there. Canonicus died in 1647. In 1675 the Pequots sent their women and children to the Narragansetts for protection, while they attacked the people of Swanzey. The people of Boston and Plymouth at this time extorted a treaty of peace from Canonchet, the last chief of the powerful Narragansetts. King Philip, having spread havoc through the valley of the Connecticut, returned to Rhode Island, when the Narragansetts joined him, violating their treaty. The colonists, to punish the Indians for their treachery, attacked them in an immense swamp in the southern part of Rhode Island, where several tribes, including the Narragansetts, had built their wigwams and gathered together their families and supplies for the winter, their fort being on an island in the swamp. The whites burned 500 of their wigwams, and their provisions, men, women, and children perishing in the flames. Canonchet was made prisoner and killed. After this war only a few of the Narragansetts were left; these intermarried with the colonists, and became civilized. A few of the tribe still remain in the region of Charlestown, R. I.

NARSES, a celebrated statesman and gen., and almost the last stay of the old Roman empire in Italy, was b. toward the last quarter of the 5th century. The place of his birth is uncertain. His parentage was obscure, and he was probably sold as a slave in childhood, having, according to the barbarous usage of the period, been previously emasculated. From some menial office in the imperial household at Constantinople, he rose by successive steps to the post of *cubicularius*, or private chamberlain of the emperor Justinian, and ultimately to that of keeper of the privy purse. In the difficult art of courtiership, Narses long maintained a pre-eminence. More remarkable, however, considering his condition, was the distinction which he attained in military affairs. In 538 he was sent to Italy in command of a body of troops, professedly to act in concert with Belisarius (q.v.); but in reality, it is conjectured, with a secret commission to observe and control that general. After some successes, Narses, having disputed with Belisarius, assumed an independent authority; but his separate command was unfortunate, and he was recalled to Constantinople in 539. After some years, however, Belisarius was recalled, and Narses was appointed to the chief command in Italy. His conduct of that expedition extorted the admiration even of his enemies, Not having the command of a sufficient number of transports, he marched his army along the whole circuit of the shore of the Adriatic, and while the enemy's fleet were still in possession of the sea, was enabled to encounter them in the plain of Sentaglio, near Tagina, where, after a desperate engagement, the Goths were totally defeated, and their king, Totila, slain, Narses took possession of Rome, and after a series of successes both in southern and northern Italy, completely extinguished the Gothic power in that peninsula. Justinian appointed Narses exarch of Italy in 553. He fixed his court at Ravenna, and continued, till the death of Justinian, to administer the affairs of Italy with a vigor and ability which did much to stay the progress of that decay which had long infected all its social, political, and military institutions. The only blot on the character of his administration is the avarice with which he is charged by his contemporaries. His exactions pressed heavily on the exhausted resources of the population; though their severity may be in some degree palliated by the splendor and utility of the public works on which he partly expended the public resources. On the death of Justinian, his ascendency came to an end. The Romans, on the accession of Justin, complained to him of the exactions of Narses, and that emperor deprived him, in 565, of his office; a proceeding to which a special indignity was imparted by an insulting message from the empress, that it was time for him to "leave arms to men, and to spin wool among the women of the palace." To this bitter taunt (according to Paulus Diaconus, *De Gest. Long.* ii. 6), Narses replied that he would "spin for her a thread which she would find it hard to unravel;" and he is accused of secretly intriguing with Alboin, king of the Lombards, to incite a new invasion of Italy, at the same time submissively offering his services to the emperor for the purpose of repelling the invasion. This account, however, seems uncertain, and perhaps improbable; and as Narses died at Rome in 568, just on the eve of the Lombard invasion, no light is thrown upon this story by the actual events of the war. His

age at the time of his death is a subject of much curious controversy. According to the popular account, it was no less than 95 years; but this is doubted by most of the historians.

NAR'THEX, a part of the early Christian churches separate from the rest by a railing or screen, and to which the catechumens and penitents were admitted.

NARUSZE'WICZ, Adam Stanislaf, 1733–96; b. Lithuania. After completing his studies at the university of Vilna, in 1748, he entered the order of Jesuits, traveled through Germany, France, and Italy, and on his return became director of the Jesuit college of Warsaw, and a friend of king Stanislaf-August. Upon the suppression of his order he was appointed coadjutor to the bishop of Smolensk in 1788, secretary of the council, and finally bishop of Lutsk. After the death of the king he resided in Janovisc (Gallicia), where he died. His chief work is the *History of the Polish Nation,* in 10 vols., which gained for him the title of the Polish Tacitus. He published also an excellent translation of Tacitus, a *History of the Crim-Tartars;* a *Life of Khodkiévitch Hetman of Lithuania;* and 4 vols., of poems, odes, satires, fables, etc.

NARVA, a Russian t. in the gov., and 95 m. w.s.w. of St. Petersburg, is situated on the Narova, 10 m. from its mouth in the gulf of Finland. It was founded in 1233 by Waldemar II., king of Denmark, and came into the possession of Russia in 1704. The navigation of the Narova is impeded by a waterfall near Narva, 14 ft. high. In 1873 168 ships, of 18,175 lasts (1 last=$1\frac{11}{14}$ ton), entered the port; the exports, chiefly flax and timber, were £150,693; the imports £402,340. At the waterfall above the town there are sawmills, and an extensive cotton-mill which employs 1700 workmen. Though belonging to the government of St. Petersburg, Narva is ruled by the laws of the Baltic provinces. Here, in November, 1700, Charles XII., with 8,000 men, defeated a Russian army of 60,000 men, under Peter the great and the duke of Croy. Pop. '78, 6,482.

NARVAEZ, Pamfilo de, 1480–1528; b. Spain; sailed for the West Indies not long after the discoveries of Columbus. In 1501 he was in Santo Domingo, in the conquest of which, as also of Jamaica and Cuba, he participated; and in the reduction of the latter he was second to Velasquez, the governor, in command of the Spanish forces. In 1520 Velasquez sent him on an expedition to Mexico to bring Cortes to submission, and with orders to arrest him and take his place in the government of the country. But Cortes fell upon him at Zempoalla, and took him prisoner; and Narvaez lost an eye in the battle. He was imprisoned by Cortes for five years; but his adherents joined the army of Cortes and took part with it in the battles which resulted in the conquest of Mexico. On his liberation Narvaez returned to Spain, and attempted in vain to induce the government to punish Cortes. He succeeded, however, in obtaining an extensive grant of land in America, and arrived at Tampa bay in 1528 with a force of 400 men whom he intended to settle somewhere in Florida. He went on to Appalachee, but was met everywhere by the bitter hostility of the natives; and the country, contrary to his expectations was sparsely settled and poor. He reached the sea-coast, and attempted to go to Mexico in boats; near the mouth of the Mississippi his boat was sunk, and he was drowned. Only a few of his companions, after suffering great hardships for nearly 8 years, succeeded in reaching Sonora, whence they went to Mexico.

NARVAEZ, Don Ramon Maria, Duke of Valencia. a Spanish general and statesman, was b. at Loja, in Andalusia, Aug. 4, 1805, and when very young served in the war of liberation against the French. He was an officer in 1820, when constitutional government was re-established in Spain; and in 1822, when a reactionary party of the royal guard took up arms to destroy the work of the revolution, Narvaez ranged himself on the side of the liberals, and contributed by his courage to the repression of the mutiny. Shortly after, under the command of Mina, he made the campaign of Catalūna against the guerrillas, who were assisted by the monks. The invasion of Spain by a French army in 1823 forced him to retire from active life. He withdrew to Loja, and lived there in obscurity until the death of Ferdinand VII. in 1832. In 1834, as capt. of chasseurs, he maintained a hot struggle against the Carlists of the Basque provinces, and signalized himself in various engagements. In 1836 he commanded a division under the orders of Espartero, and in November of that year completely routed the Carlist leader Gomez, near Arcos. This was a decisive moment in his career. He now became immensely popular, aspired to the highest offices of the state, and was regarded as the rival of Espartero. In 1838, by acts of terrible severity, he cleared the district of La Mancha of brigands, and was appointed in 1840 capt.gen. of Old Castile, and general-in-chief of the army of reserve. When Espartero gave gen. Alaix a place in the ministry, Narvez resigned his command. He took part in the insurrection against Espartero that broke out at Seville in 1840, but that having failed, he was compelled to flee to France, where he was shortly after joined by queen Christina (see Maria Christina), and commenced those plots against the government of Espartero which, in 1843, effected its overthrow. In 1844 he was appointed president of council and created duke of Valencia. His ministry was thoroughly reactionary. He recalled Maria Christina, and revised the liberal constitution of 1837. The progressista party was dissatisfied, and petty insurrections broke out, which the rigorous soldier-statesman repressed with an iron hand. But his dictatorial manners finally alienated even his personal friends, and his ministry was over-

thrown (Feb. 10, 1846). After a brief exile as special ambassador at the French court he returned to power in 1847, but soon afterwards quarreled with queen Christina, and found it necessary again to retire from office in 1851. In 1856, on the overthrow of O'Donnell's ministry, he again became president of council, and immediately commenced to strengthen the royal authority and to restrict the liberty of the press. The intrigues of the court compelled his resignation in 1857. He returned to power in 1864, and (1865) was succeeded by O'Donnell, with whom he suppressed, in 1866, a military revolt in Madrid. He replaced O'Donnell in the same year, and, despite the efforts of O'Donnell and Prim, retained power till his death in 1868.

NARWHAL, *Monodon*, or *narwhalus*, a genus of *cetacea*, of the family *delphinidæ*, resembling *beluga* (q.v.) in form and in the want of a dorsal fin, but remarkably characterized by having no teeth at all, except two in the upper jaw, supposed to be canines, which sometimes remain quite rudimentary, even in the mature animal, as they are in the young, and sometimes developed into great spirally twisted straight tusks, passing through the upper lip, and projecting like horns in front, Only one species is ascertained, *M. monoceros* or *N. vulgaris;* the other species which have been described by naturalists having been founded on exaggerations and untrustworthy observations. It inhabits the Arctic seas, and is very rarely found so far south as the Shetland isles, although an accidental wanderer has reached the coast of England. Narwhals are often seen in great numbers among the ice-fields, and in the creeks and bays of the most northern coasts. They commonly associate in small herds. The tusks are much more frequently developed in the male than in the female, but in the female also they sometimes attain a large size. It is but rarely that both tusks are largely developed, although they sometimes are so, and then diverge a little; one of them generally continues rudimentary or attains a length only of a few inches, whilst the other becomes a great horn, projecting straight in front, from which the animal has received the name of Sea Unicorn. A mature narwhal is generally about 15 or 16 ft. in length, without reckoning the tusk, which is from 6 to 10 ft. long. The body is less thick than that of the beluga; the head is small, the forehead rises abruptly, the muzzle is very obtuse, the upper jaw projects a little; the first half of the body is nearly cylindrical, the remainder to the tail fin is conical. The tusk is hollow nearly to the point. Its use is rather conjectured than known. It is probably a weapon of defence, but Scoresby has suggested that it may be also used for breaking thin ice in order to obtain opportunity for respiration; and for killing fish, as he found remains of skates and other flat-fish in the stomach of a narwhal, which it is not easy to imagine how a toothless animal, with rather small mouth and lips, could capture and swallow, unless the formidable tusk were first employed. Cephalopodous mollusks, however, are believed to constitute a principal part of the food of narwhals. The narwhal is a very active animal, swimming with great rapidity, lively, and playful. A group of narwhals playing together, projecting their great horns from the sea, and crossing them in their sport, is a very interesting sight. The narwhal is pursued by the Greenlanders and other inhabitants of the north, for the sake of its blubber, with which its whole body is invested to the thickness of about 3 in., amounting to nearly half a ton in weight, and yielding a large proportion of excellent oil. The tusks are also valuable, being of an extremely compact white substance—denser, harder, and whiter than ivory—which is used as a substitute for ivory. The kings of Denmark have long possessed a magnificent throne of this material, which is preserved in the castle of Rosenberg. The flesh of the narwhal is used by the Greenlanders as food. Great medicinal virtues were formerly ascribed to the tusks, but were merely imaginary.

NASA'LIS, or Proboscis Monkey, *Nasalis larvatus*, a monkey allied to the *doucs* or *semnopitheci,* but distinguished from all other monkeys by an extreme elongation of nose, that organ being nearly 4 in. in length in the mature animal. In the young the nose is comparatively undeveloped. The nostrils are placed quite at the extremity of the nose, and are separated merely by a thin cartilage. Of what use the magnitude of its nose is to the animal is unknown. The nasalis inhabits Borneo and neighboring islands. It is gregarious. It is an animal of about 3 ft. in height if placed erect a position it does not often assume. It can leap 15 ft. or more. Its fur is thick, not long, nor woolly; chestnut red, and in some parts golden yellow.

NASCAPEES', or Nascapis, a tribe of Indians inhabiting Labrador, of the Algonkin family, of whom very little is known, as missionary effort has had small influence among them, and there has been little other opportunity offered for investigating their history or their manners and customs. No linguistic works concerning them have been published, though grammars of their language are said to be in existence in manuscript. The number of the Nascapees was estimated in 1870 to be about 2,860.

NAS'CENT STATE, in chemistry. When an element or compound is liberated from some chemical combination in which it had previously existed, the element or compound so liberated is at the moment when it escapes said to be in a nascent state; and it is *then* often capable of exerting far more powerful combining action with other bodies than it can exhibit when brought in contact with them *after* it has been liberated. Arsenic and hydrogen will not directly combine if brought in contact with one another under ordinary circumstances, but the application of Marsh's test (see Arsenic) depends upon the direct union of the nascent hydrogen (liberated by the decomposition of the water) with

the arsenic, giving rise to arseniureted hydrogen gas. Again, if hydrated protoxide of nickel (NiO,HO) be suspended in a solution of caustic potash (KO,HO), it will undergo no change if a current of oxygen gas be passed through the solution; but if a current of chlorine be substituted for the oxygen, the whole of the metallic protoxide will be converted into the brown sesquioxide (Ni_2O_3), the resulting decomposition being shown in the equation:

$$\overbrace{2(NiO,HO)}^{\text{Protoxide of Nickel.}} + \overbrace{KO,HO}^{\text{Solution of Potash.}} + Cl = \overbrace{Ni_2O_3,3HO}^{\text{Hydrated Sesqui-oxide of Nickel.}} + \overbrace{KCl}^{\text{Chloride of Potassium.}}$$

This change arises from the action of the chlorine upon the potash, during which chloride of potassium (KCl) is formed, while the nascent oxygen which is liberated from the potash combines with the oxide of nickel. Again, cyanogen (C_2N) and chlorine do not enter directly into combination, but if cyanogen at the instant that it is liberated from one of its compounds (as, for example, cyanide of mercury) comes in contact with chlorine, the two combine; and many other examples of similar action might be adduced.

NASEBY, a parish and village of England, in the county of Northampton, 12 m. n. of the town of that name. Pop. '71, 693. The battle of Naseby, between Charles I. and the parliamentary army under Fairfax and Cromwell, took place here, June 14, 1645. It resulted in the total defeat of the royalists, the king being compelled to flee, after losing his cannon and baggage, and nearly 5,000 of his army as prisoners.

NASH, a co. in n.e. North Carolina, bounded on the n. by Swift creek, on the s.w. by Contentny creek, and drained by Tar river; 500 sq.m.; pop. '80, 17,731—17,718 of American birth, 8,313 colored. The surface is irregular and heavily wooded. The principal productions are Indian corn, cotton, sweet-potatoes, wheat, and oats. Co. seat, Nashville.

NASH, Abner, 1730–86; b. Va., brother of gen. Francis; when very young removed from Prince Edward co. to Newbern, N. C., where he studied law, entered at the bar, and continued a successful practice for many years. He was a member of the provincial congress in August, 1774, and of the council in 1775. In 1776 he was a member of the commission which framed the state constitution of Virginia, and was elected to the house of commons session of 1777–78. In 1779 he was elected president of the senate, and governor of the state in 1780, resigning in the following spring, He married for his first wife the widow of governor Arthur Dobbs. In 1782 he was again elected to the assembly and was sent by that body as delegate to congress 1782–84 and 1785–86.

NASH, Francis, b. Va.; settled in Orange co., N. C.; was clerk of the superior court of the county before the revolution; was a member of the provincial convention of 1775, by which he was appointed lieut.col.; in 1777 was made brig.gen. by the continental congress; commanded a brigade at Brandywine and Germantown. At the latter place he was mortally wounded, and died at Kalpsville, Penn., Oct. 17, 1777. A monument was erected by the citizens of Germantown and Norristown.

NASH, John, an architect, was b. in London in 1752. He underwent the usual course of training for his profession, but soon entered into some building speculations which enabled him to buy a small property in Caermarthen. Here in fresh speculations he lost much money; therefore, in 1792, returned to London and architecture, in which he speedily rose to eminence. On the strength of having obtained a patent in 1797 for improvements in the construction of the arches and piers of bridges, he was in the habit of claiming a great part of the credit of introducing the use of cast-iron girders. A large part of his time was occupied in designing and constructing mansion-houses for the nobility and gentry in England and Ireland, but he is chiefly celebrated in connection with the great street improvements in London. From Feb., 1815, when he was appointed "architect, valuer, and agent to the board of woods and forests," down till near the end of his professional career, he was busily engaged in the planning of routes, grouping of buildings, and fixing of sites. Regent street, Haymarket theater, Langham place church, and the terraces in Regent's park are specimens of his designs. The pavilion at Brighton was another of his works. He retired from his profession in 1834, and died May 13, 1835. Nash, notwithstanding his many defects, possessed great power of effective grouping, as is well shown in his works. In the architecture of mansion-houses the designing of "interiors" was his *forte*.

NASH, Joseph, b. in England 1812; began his career as an artist in 1835 by exhibiting drawings of French cathedrals and other ancient buildings. He soon acquired high rank as a painter in water-colors and he made a specialty of illustrating old English architecture and domestic interiors. Nash published two series of these illustrations. *Architecture of the Middle Ages* (1838), and *Mansions of England in the Olden Time* (1839–49). Nash also produced historical paintings in water colors, such as "Charles V. visiting Francis I. during his Confinement;" "Queen Catherine, Campeius, and Ladies" and "The Queen's Visit to Lincoln Hall" (1846). In 1878 an annual pension was bestowed upon him in recognition of his services to art. He d. 1878.

NASH, Richard, better known by the name of *Beau Nash,* a fashionable character of the last century, who attained to a very remarkable notoriety, was the son of a Welsh

gentleman, and was born at Swansea, in Glamorganshire, Oct. 18, 1674. After studying at Oxford, he held for some time a commission in the army, and subsequently took rooms in the Temple, but the dissipations of society had more attraction for him than the pursuits of law. He became a diner-out, a frequenter of good society, and contrived to support himself by gambling. But the grand turning-point in his fortunes was his visit in 1704 to Bath—then a favorite haunt of elegant invalids, and the scene of the gayest intrigues. Nash undertook the management of the public balls, which he conducted with a splendor and decency never before witnessed. In this way he came to acquire an imperial influence in the fashionable society of the place. It appears that he was also distinguished by a species of sentimental benevolence. He played hard and successfully; yet if he heard an individual sighing behind his chair, "Good Heavens! how happy would that money make me," Nash would thrust his own winnings into his hands, with theatrical generosity, and exclaim: "Go, and be happy." His own equipage at this period of his career was sumptuous. He used, we are told, to travel to Tunbridge in a post-chariot and six grays, with outriders, footmen, French-horns, and every other appendage of expensive parade. He is praised for the great care which he took of the morals of the young ladies who attended the Bath balls, always putting them on their guard against needy adventurers—like himself. In his old age, Beau Nash sank into poverty, and often felt the want of that charity which he himself had never refused. He died at Bath, Feb. 3, 1761, at the age of 87.

NASH, Thomas, 1564–1601; b. England; took a bachelor's degree at Cambridge, from which he was expelled for lampooning the college authorities. After a long tour on the continent he settled in London, and became a literary free lance. He began his career by some clever satires on the Puritans, whom he ridiculed in his *Pap with a Hatchet*, *An Almond for a Parrot*, and *A Countercuffe to Martin Junior*. His powers of satire soon made him a favorite with the wits of the day. In 1590 he was associated with Marlow in the composition of *The Tragedy of Queen Dido*, and two years later his comedy, called *Summer's Last Will and Testament*, was produced in the presence of queen Elizabeth. But witty as he was as a pamphleteer, he had little talent as a dramatist; his play fell flat, and, as writing for the stage was then the only remunerative field for an author, he was soon miserably poor. In his *Pierce Penilesse, his Supplication to the Divell*, he describes himself as "sitting up late and rising early, contending with the cold, and conversing with scarcitie;" and the same tone prevails in his *Christe's Tears over Jerusalem*. He soon plucked up his old spirits, however, and began to assail Gabriel Harvey, a friend of Spenser and sir Philip Sidney, but an object of constant ridicule by the town wits. Harvey defended himself, but in vain, against the shower of pamphlets which Nash rained upon him. In 1597 Nash produced a satirical play called *The Isle of Dogs*. His satire seems to have been too pungent, for he was arrested and imprisoned in the Fleet. No later work of his is known.

NASH, William, D.D., b. in Stuttgart, Germany, 1807; educated at the university of Tübingen. Removing to the United States, he became a minister of the Methodist Episcopal church at the west, and founded American German Methodism. He published a German commentary on the Bible, and for several years has edited the German publications of the Methodist Episcopal church.

NASHUA, a manufacturing city of New Hampshire, U. S., at the junction of the Merrimack and Nashua rivers. The falls of the latter afford water-power to six large manufacturing companies, which have extensive cotton-mills, machine-shops, etc. It has 10 churches, 3 banks, 2 newspapers. Pop. '70, 10,543.

NASHUA (*ante*), is in Hillsborough co., N. H., 35 m. s. of Concord and 14 m. n.w. of Lowell, on the Boston, Lowell and Nashua and the Concord railroads, and is a terminus of the Nashua and Rochester and the Worcester and Nashua railroads. It was incorporated as a city in 1853, and is now second in the state in manufactures, third in population, and fourth in wealth. Its mills and factories produce annually goods valued between $7,000,000 and $8,000,000. Besides its mills for the manufacture of cotton cloth, the city contains also the Nashua iron works. Pop. '80, 13,397.

NASHVILLE, a city, port of entry, and capital of Tennessee, U. S., on the Cumberland river, 200 m. above the Ohio, and a little n. of the center of the state. The river is navigable by steamboats of 1500 tons 50 m. above Nashville. Five railways connect it with a vast and fertile country. It is a handsome, well-built city, with a state-house, which cost a million of dollars; court-house, 3 universities, hospital, custom-house, theater, penitentiary, free academy, Protestant and Catholic orphan asylums, 34 churches, with numerous daily, weekly, and monthly publications. It has a large commerce, flour, saw, and planing mills, a large cotton factory (with 400 looms and 13,840 spindles in 1875), manufactories of engines and machinery, etc. The value of the wholesale trade in 1873 was $51,261,570. Near the city are the state lunatic asylum, and the "Hermitage," once the residence of president Jackson. Nashville was occupied by the Federal troops in 1862, and here the federal gen. Thomas gained a victory over gen. Hood. Pop. '70, 25,865.

NASHVILLE (*ante*), co. seat of Davidson co., in lat. 36° 10′ n., long. 86° 49′ w., on the Louisville and Nashville, the Nashville and Decatur, the Nashville and Tuscaloosa, the

Nashville, Chattanooga, and St. Louis, the St. Louis and Southeastern, and the Louisville and Great Southern railroads: pop. '80, 43,461. It is built on gradually rising ground, with regular streets, at right angles to each other. The finest public building is the capitol, on an abrupt eminence 175 ft. high; it is 240 by 135 ft., built of limestone and iron, at a cost of nearly $1,500,000. It is three stories high, surmounted by a tower 206 ft. high from the ground. The corner-stone was laid in 1845. Among the other public buildings are the state penitentiary, 310 ft. by 50; the court-house, market-house, county jail, and a lunatic asylum, with accommodations for 400 patients. There are also many handsome private residences. The city is supplied with water from the river by an elaborate system of water-works. A suspension bridge and railroad drawbridge span the river, connecting the city with Edgefield opposite. The educational facilities of Nashville are unsurpassed in the south-western states. Besides its public schools, it contains Nashville university, founded in 1785 under the name of Davidson academy, and which received its present name in 1826; the Fisk university, for the education of colored teachers, founded in 1867, under Congregational control; the Vanderbilt university, founded in 1875, named after the late Cornelius Vanderbilt, of New York, and controlled by the Methodist Episcopal church (south); the central Tennessee college, for colored people, also under Methodist control, founded in 1866; the Nashville medical college, the Tennessee college of pharmacy, St. Cecilia's academy and St. Bernard's academy, Roman Catholic, and others. There is a fine government building, used as a custom-house and post-office. The city has many churches, a state and public library, an opera house, 2 theaters, an elegant masonic temple, national and savings banks, fine hotels, and 22 periodicals, including 2 dailies. The river is navigable during high water from its mouth to Nashville. On account of its situation and ample railroad connections Nashville is the center of a great wholesale trade with the surrounding region. Groceries, cotton, dry goods, liquors, flour and wheat, boots and shoes, are the largest components of this trade. There is a large cotton-factory; and there are saw, flour, and planing mills, iron-foundries, machine-shops, paper-mills, distilleries, tanneries, etc. The city is divided into 10 wards, governed by a mayor, a common council of 20, and a board of aldermen of 10 members. Nashville was settled in 1779, incorporated as a town in 1784, as a city in 1806, and made the state capital in 1843.

NASHVILLE, Battle of. After the battle of Franklin, Nov. 30, 1864, between Hood and Schofield, the latter withdrew to Nashville, which he reached the next day, taking up his position on the heights about the city. Before Hood had established his lines s. of Nashville on the 4th, Thomas had been re-enforced by Morgan's division from Chattanooga, by Steedman's command of 5,000 men, by A. J. Smith's from Missouri, and by additional recruits, so as to be about equal to Hood's except in cavalry. The greater part of the cavalry force of Thomas had gone with Sherman. A storm on the night of Dec. 8, prevented operations for nearly a week. On the night of the 14th a plan of operations was agreed upon and was successfully carried out the next day, in spite of a dense fog in the morning. Hood was driven back of his line of works, to a position at the foot of Harpeth hills. His loss in killed and wounded was heavy; and some 1200 prisoners and 16 pieces of artillery were taken from him. The federal loss was much less. On the morning of the 16th the battle was renewed, and by evening the confederate army was in retreat, having lost in the 2 days' fighting, 4,462 prisoners and 53 pieces of artillery. The federal army followed up the pursuit till the 27th, when the remainder of Hood's army crossed the Tennessee. The main federal army then gave up the pursuit, which was, however, continued by a cavalry force under Palmer, which caught up with the retreating army and destroyed a large amount of property. The loss of Thomas was estimated at about 10,000, during the entire campaign, from Sept. 7, 1864, to Jan. 20, 1865. In the same time 13,189 prisoners and 72 pieces of artillery were captured from the confederates. Hood was relieved from command Jan. 23, 1865.

NA'SMYTH, James; b. Edinburgh 1808; son of Alexander, the landscape painter. By the sale of models of steam engines and other machinery he was able to pay his fees at Edinburgh university, where he studied mathematics, natural philosophy, and chemistry. In 1829 he became assistant to the celebrated London engineer, Henry Maudslay, and in 1834, he began the manufacture of mechanical tools at Manchester, on his own account. The capacity of his Manchester works soon grew too small for the demands of his business, and he built a series of great workshops, called the Bridgewater foundry, near Manchester. Among the mechanical tools which he has invented are the steam-hammer, steam pile-driver, the suction-fan for ventilating mines, the safety foundry ladle, for pouring castings with safety to the workman, a spherical seated safety-valve, and a reversible rolling mill which does away with the necessity of a fly-wheel. He retired from business in 1857, and has since been engaged in researches into the structure of the sun and moon, with telescopes of his own manufacture. He has published *Remarks on Tools and Machinery*, 1858; and in association with James Carpenter, *The Moon Considered as a Planet, a World, and a Satellite.*

NA'SO, a t. in the province of Messina, Sicily, 43 m. w.s.w. from Messina; pop. 2,306. It is a walled t., with a number of fine buildings. There are mineral springs in the vicinity.

NASON, Elias; b. Mass. 1811; graduated at Brown university in 1835; devoted himself to music, botany, and the languages; was a teacher and editor in Georgia, and

in 1840–49 an instructor in Newburyport, Mass.; has been pastor of Congregational churches in Massachusetts and New Hampshire. He published *Lives* of sir C. H. Frankland, Susanna Rowson, Nathaniel Howe, Charles Sumner, and Henry Wilson; and a *Gazetteer of Massachusetts.*

NASR-ED-DIN, b. Persia, 1831. On the death of his father, Muhammed Mirza, Sept. 10, 1848, he ascended the throne of Persia. His reign has been principally distinguished by his successful contests with the neighboring tribes, his suppression of the sect of the Babis, who revolted and attempted his life in 1852, his defeat in the war with England in 1856–57, the famine which desolated a large part of his country in 1871, and his visit to the principal courts of Europe in 1873, which he described in a curious diary translated into English by J. W. Redhouse. The concessions which he made to baron Reuter for establishing railroads and canals, and working the mines in Persia, ended in no practical results. He has three sons and eight daughters, the heir presumptive is Muzaffer-ed-din, gov. of Agerbaidjan.

NASSAU, an island in the Pacific ocean, lying in lat. 11° 30′ s., long. 165° 30′ w. It is low and uninhabited, was discovered in 1835 by a captain of an American whaling ship.

NASSAU, formerly a German duchy, now Wiesbaden, a district of the Prussian province of Hesse-Nassau, in 49° 50—50° 50′ n. lat., and 7° 30′—8° 45 e. long., is bounded w. and s. by the Main and the Rhine, the Prussian-Rhenish provinces, and the grand-duchy of Hesse; e. by the Hesse and Frankfort territories; and n. by Westphalia. Area, 1802 sq. miles. Pop. '80, 731,425. Wiesbaden possesses very great physical advantages. In its southern districts, nearly the whole of its area is occupied by the Taunus mountains, whose highest point, the great Feldberg, attains an elevation of about 2,750 feet. This range includes within its boundaries the fertile valleys known as the Rheingau. The northern part of the district includes the barren highlands of the Westerwald, whose most considerable peak, the Salzburger Head, is nearly 2,000 ft. high. Besides the Rhine and the Main, which are the boundary-rivers, Wiesbaden is traversed from e. to w. by the Lahn, which becomes navigable at Weilburg, and is augmented by the confluence of numerous other streams, as the Weil, Embs, Aar, Dill, and Elbe. The productiveness of the soil is proved by the excellent quality of the numerous vegetable products, which include corn, hemp, flax, tobacco, vegetables, and fruits, including grapes, which yield some of the most highly esteemed Rhenish wines. The hills are well wooded, and abound with game of various kinds, and the rivers yield an abundance of fish and crustaceans. In the more mountainous districts, iron, lead, copper, and some silver are obtained, together with good building stone, marble, and coal; the chief mineral wealth is, however, derived from the numerous springs, which, directly and indirectly, bring the government a clear annual gain of more than 100,000 gulden. The most noted of these springs, of which there are more than 100, are Wiesbaden, Weilbach, Langen-Schwalbach, Schlangenbad, Ems, Selters, and Geilnau, the majority of which were the property of the duke.

Wiesbaden, which is divided into 12 circles, has few towns of any commercial importance, but it boasts of many fashionable watering-places, which are annually crowded with visitors from every part of the world. Of these, the most considerable are Wiesbaden (q.v.), the capital of the district—pop. '75, 43,674—Schwalbach, Schlangenbad, Fachingen, Selters, and Geilnau. Höchst, an active little place on the Main, is the only manufacturing town of the duchy, but a brisk trade is carried on at many small ports on the Rhine, Main, and Lahn, from whence the mineral waters, wines, and other natural products of the country are exported. The exports are wine—including some of the choicest kinds, as Hochheimer, Johannisberger, Rüdesheimer, Markobrunner, Asmannshäuser—mineral waters, corn, iron, manganese, cattle, etc.; while the imports embrace colonial products, manufactured goods, salt, jewelry, etc.

Nassau had a representative form of government, based on the constitution of 1814; and the duke, who was also a count-palatine of the Rhine, count of Sayn, Königstein, Katzenellenbogen, and Dietz, etc., was assisted in the government by a council of state, presided over by a prime-minister. The legislative assembly consisted of an upper chamber composed of 24 representatives, chosen for six years, and a second chamber, chosen annually. More than one-third of the population belonged to the Catholic church, which was under the ecclesiastical jurisdiction of the bishop of Limburg, who was assisted by a board of commissioners, located at Eltville, on the Rhine; and excepting about 19,000 persons who belonged to the Jewish and other persuasions, the remainder of the people, including the then reigning house, professed the "evangelical" form of German Protestantism, and were comprehended in one episcopal see under the bishop of Wiesbaden. Ample provisions were made in the district for popular education, in furtherance of which there were upwards of 700 elementary schools, with about 1000 teachers, 10 normal schools, a gymnasium, various training, theological, polytechnic, military, and other educational institutions. In accordance with a treaty with Hanover, Göttingen constitutes the university for arts for Wiesbaden, which has also a Roman Catholic theological faculty in conjunction with Hesse-Cassel at the university of Marburg. Wiesbaden, which is the principal seat for all national institutions of literature, science, and benevolence, has a good public library, containing 60,000 volumes, a museum, etc.

Nassau occupied, in conjunction with Brunswick, the thirteenth place in the limited council of the diet, but it had two votes in the *plenum*, or full council. It furnished a contingent of 4,279, with a reserve of 1833 men, to the army of the old confederation.

The receipts, according to the budget of 1866, were 4,461,410 florins derived from the crown domains and indirect taxes, and 317,935 florins from direct taxation, while the expenditure was estimated at 5,804,975 florins. The national debt at the close of 1864 represented a capital of 6,038,300 florins. The duke, who was in possession of very extensive domains, ranked as one of the richest princes of Germany.

In tracing the history of Nassau to its earliest origin, we find that the districts now known by that name were anciently occupied by the Alemanni, and on the subjugation of the latter people by the Franks, became incorporated first with the Frankish, and next with the German empire. Among the various chiefs who raised themselves to independent power in this portion of the Frankish territories, one of the most influential was Otto of Laurenburg, brother of king Conrad I., who became the founder of two distinct lines of princes. The heads of these lines were Walram and Otto, the sons of count Henry I., who, in 1255, divided the land between them. Walram II., the elder, was the progenitor of the house of Laurenburg, which, towards the close of the 12th c., assumed its present name of Nassau from the name of its chief stronghold; while Otto, the younger, by his marriage with the heiress of Gelders, founded the line of Nassau-Gelders, whose last male representative died in 1423, but which still survives through a female branch, in the family now occupying the throne of the Netherlands. This junior branch of the house of Nassau, by inheritance from a collateral representative, acquired possession, in 1544, of the principality of Orange; and since that period the representatives of the Otto line have been known as princes of Orange (q.v.). The Walram line, which in 1292 gave an emperor to Germany, in the person of Adolf of Nassau, was subdivided by the descendants of that prince into several branches, until, by the successive extinction of the other lines, the Nassau-Weilburg family, which at present reigns over the duchy, was left, in 1816, the sole heir and representative of the Walram dynasty in Germany. Nassau had been declared a duchy in 1806, and in 1817 the reigning duke William granted a new constitution; but during the first sittings of the assembly, dissensions arose between the ducal government and the representatives, the former having attempted to establish the proposition that the ducal domains were the unconditional property of the royal house, and that all the expenses of the state would consequently have to be met by taxation.

This proved a fruitful source of dissension between the duke and his people, and the opposition and discontent to which it gave rise were not finally allayed till 1834, when a more liberal ministry under count Walderdorff, succeeded the unpopular cabinet which had hitherto directed public affairs. Concessions were made by the ducal government, which met the requirements of the chambers, and a satisfactory compromise was effected in regard to the crown revenues. In 1836 Nassau joined the German *Zoll-Verein*, and subsequently to that period it has continued to advance in material prosperity. The reigning duke Adolphus William, who succeeded his father, duke William, in 1839, showed the same conservative tendencies as his predecessor. The revolutionary crisis of 1848 found the people, who had been harassed by over-government and by a jealous dread of liberal sentiments, ripe for insurrection. The peasantry rose *en masse* in the rural districts, and revenged themselves for the severity of the game-laws and other obnoxious restrictions by perpetrating the most wanton destruction of game and wood in the forests belonging to the crown and nobility. These disorders were speedily put down by the aid of federal troops, but, notwithstanding the concessions made by the government, the relations between the people and their ruler continued for many years to be unsatisfactory, For the events which led to the incorporation of Nassau with Prussia, see GERMANY.

NASSAU, a co. in n.e. Florida, bounded e. by the Atlantic, n. and n.w. by Georgia, from which it is separated by St. Mary's river; drained also by the Nassau river, its s. boundary; traversed by the Florida railroad; about 600 sq.m.; pop. '80, 6,635—3,560 colored. Amelia island is included in the county. The surface is level, and the soil toward the coast, sandy; rice, sweet potatoes, Indian corn, and molasses are the chief products. Co. seat, Fernandina.

NASSAU, the capital of New Providence, is the center of the trade of the Bahamas (q.v.). It is pleasantly situated on the face of a hill, in lat. 25° 5′ n., long. 71° 21′ w. Pop. 9,000. The town is well laid out; has several handsome public buildings, and an excellent and well-sheltered harbor. The climate is very salubrious, and Nassau is a great resort of invalids from the north. It has extensive hotel accommodation, a lunatic asylum, and a leper-house, and is defended by two forts. Nassau exports cotton, pimento, and salt. During the civil war in the United States, it became notorious in connection with the blockade-runners.

NASSAU HALL. See NEW JERSEY, COLLEGE OF.

NASSICK′, or NASHIK, a t. of British India, in the district of the same name, in the presidency of Bombay, 95 m. n.e. of Bombay, on the river Godavery, not far from its source. It is a town of great sacredness in the estimation of the Hindus—more revered

than even Benares—is a great place of pilgrimage, the chief seat of Brahmanism in the Deccan, and the residence of many families of Brahmans, some of them living in great affluence. It contains many temples, which are built along both banks of the Godavery, and on rocks in the river. They are all of black basalt, and dedicated to Siva. Of far greater interest, however, are the Buddhist caves, about 5 m. from the town, which are situated in a conical hill, at a height of about 100 yards from its base. They are rudely executed. The figures which they contain are in a state of good preservation, and the leading figures are those of Buddha; but the whole character of the remains is thought to indicate Buddhism in a state of transition or compromise with Brahmanism. One cave is 45 ft. sq., and its flat roof is wholly unsupported. Notwithstanding the Buddhist origin and character of these caves, the Brahmans of Nassick, for the sake of gain, encourage the popular reverence for them. Nassick contains a resident population of (1872) 22,436.

NAST, Thomas, b. Bavaria, 1840. His parents emigrated to America in 1846, and when only 14 years of age he was employed as a draughtsman on *Frank Leslie's Illustrated Newspaper*. Without having received any regular instruction in drawing, he furnished acceptable sketches for the engravers. He went to England in 1860 to illustrate the Heenan and Sayers prize-fight for the *New York Illustrated News*. He then traveled to Italy to follow Garibaldi, and made sketches of the war which appeared in the *New York Illustrated News*, the *Illustrated London News*, and *Le Monde Illustré*. Returning to America he formed a connection with *Harper's Weekly*, which has continued uninterrupted to the present time. His contributions to that journal are mostly political cartoons, in which he effectively caricatures and satirizes the blunders of public men, and illustrates the leading topics of the day. He appeared as a lecturer in 1873 in many cities of the United States, illustrating his lectures by caricatures drawn on the platform. He started the publication of *Nast's Illustrated Almanac* in 1872, and has illustrated *The Tribute Book*, Nasby's *Swinging 'round the Cerkle*, and other works. He also illustrated the *Pickwick Papers* and *Pictures from Italy* in Harper's household edition of Charles Dickens's works. Although a clever painter in oil and water-colors, he confines himself mainly to drawing upon wood. His quickness of conception and facility of execution are remarkable, and few artists have executed so many pieces in his special sphere.

NASTURTIUM. See Cress and Tropæolum.

NATAL. The region now forming the colony of Natal derives its name from its being discovered by the Portuguese on Christmas day 1497. It was visited about 1822 by several white traders from the Cape, who found the country in possession of the Zulu chief Chaka, who ruled in a most sanguinary manner over all the tribes from the Umzimculu to the St. Lucia river. He was killed and succeeded by his brother Dingaan in 1838, but the latter having treacherously murdered a party of emigrant Dutch Boers, who had paid him a friendly visit by invitation to buy land, he was attacked and finally destroyed by the Boers, who at that time had emigrated from the Cape Colony in large numbers, and who made his brother Panda paramount chief in his stead, and then settled themselves down in the country as his lords and masters. The British government, however, now interfered, and, after a severe struggle on the part of the Boers, the country was formally proclaimed a British colony on May 12, 1843, since which time it has progressed very satisfactorily. In 1856 it was erected into a distinct and seperate colony, free from the control of the governor of the Cape. In 1873 Langalibalele, a chieftain of Zulus within the n. frontier, was on suspicion treated very summarily by the colonial government, and banished. The English government decided that the proceedings were illegal, and sir Garnet Wolseley was sent as temporary governor. It was mainly because the security of Natal was menaced by the warlike forces and equipments of Cetewayo, nephew of Dingaan, king of the free Zulus, that the Zulu war of 1879 broke out. Zululand was invaded by the British, and after a fierce defense was finally parceled out amongst various chieftains, nominally independent, but under the supervision of British residents.

The colony of Natal is on the s.e. coast of Africa, about 800 m. e.n.e. of the cape of Good Hope, between the 29th and 31st parallels of south latitude. Its n.e. boundary is the Tugela or Buffalo river, which divides it from Zululand, and its s.w. boundary is the Umzimculu and Umtamouna rivers, separating it from Kaffraria proper. A lofty and rugged range of mountains called the Quathlamba, or Drachenberg, divides it from the Free State and Basutuland, and it contains a well-defined area of 20,212 square miles.

These mountains are composed of a confused mass of granite, gneiss, sandstone, basaltic veins, and shale, and present both the flat top and serrated summits of the chain, of which they are a continuation, so well known in the Cape Colony as the Sneeuwberg and Stormbergen. About lat. 28° 30′ these mountains seem to reach their culminating point, and probably attain a height of 10,000 ft., forming a summit line of watershed, from which flow to all points of the compass the waters of the Orange, Umzimvoobo, Vaal, Tugela, and other large South African streams. Towards the coast these mountains present a scarped and almost inaccessible face; towards the interior, however, they gradually die away into the immense rolling plains of the Free State. Many offshoots from these mountains traverse the colony, dividing it into a series of steps

or plateaux, gradually rising from the coast region to the foot of the mountains, and forming so many zones of natural productions.

The coast region, extending about 25 m. inland, is highly fertile, and has a climate almost tropical, though perfectly healthy. Sugar, coffee, indigo, arrowroot, ginger, tobacco, and cotton thrive amazingly, and the pine-apple ripens in the open air with very little cultivation. The midland terrace is more fit for the cereals and usual European crops; while on the higher plateau, along the foot of the mountains, are immense tracts of the finest pasturage for cattle and sheep.

The climate is very salubrious; the thermometer ranges between 90° and 38°, but the heat, even in summer, is seldom oppressive. The mean annual temperature at Pietermaritzburg, the capital, is 64° 71′. The winter begins in April and ends in September; the average number of rainy days being 13. In the summer season the thunder-storms are very frequent and severe. The annual rainfall on the coast is about 35 inches. Inland it varies a good deal in different districts, and is greatest in summer. The south-east is the prevailing wind here in the summer months, as in the Cape Colony. Occasionally the sirocco or hot wind from the north-west is felt, which generally terminates in a thunder-storm.

Natal has but one harbor on its coast, and that is D'Urban, or Port Natal, in lat 29° 53′. It is completely landlocked, but a bar prevents vessels above a certain tonnage from entering. There is, however, generally a depth of water on it varying from 9 to 18 feet. There is secure holding-ground in the outer anchorage. The harbor of D'Urban is of great importance to Natal, as it is the only one worthy of the name on the south-east coast. Many extensive engineering operations have been carried on with the purpose of improving the harbor and increasing the depth of water at the entrance. The principal rivers are the Tugela or Buffalo, the Umcomanzi, Umgani, and Umzimculu; like the majority of South African rivers, they are of no use for purposes of inland navigation; but their streams are permanent, and often available for irrigating purposes, thus giving Natal in one very essential point a decided superiority over the Cape Colony.

Coal, copper-ore, iron, and other minerals are found in several places, and there is no doubt that when the great mountain-range is properly explored it will be found very rich in mineral wealth. Large forests of valuable timber abound in the kloofs of all the mountain-ranges, and many tracts along the coast are also well wooded. Natal is divided into the following counties: D'Urban, Victoria, Alexandra, and Alfred on the coast region; Pietermaritzburg, Umcomanzi, and Umroti, central; and Klip River and Weenen at foot of the mountains. The capital is Pietermaritzburg, with about 6,800 inhabitants, on a tributary of the Umgani river, about 50 miles inland. It possesses a large military establishment, and many substantial public buildings. Its name is a compound of the Christian name of Pieter Rietief, and the surname of Gert Maritz, two celebrated leaders of the emigrant Boers who were murdered by Dingaan. D'Urban, or Port Natal, is also a very flourishing town, having a railway connecting the landing-place at Point Natal with the town, and a population of (1881) 14,000. It has two newspapers, and several banks and other public institutions. Verulam, Weenen, Richmond, Newcastle, and Ladysmith are also flourishing towns, and several other new villages have been recently formed.

Natal has a governor aided by an executive council of five; and by a legislative council, consisting of 13 members appointed by government and 15 elected by constituencies. Municipal institutions have been granted to the principal towns. The Anglican, Scottish, Dutch, and other churches exist, and many stations of the Wesleyan, American, Norwegian, and Berlin missions exist. Education is receiving much attention, and schools are multiplying.

The De Beer and Bezuidenhout passes are the only practicable roads across the mountains, and lead by very circuitous routes across the Free State into Cape Colony; and the numerous mountain streams wanting bridges render internal communication very difficult. Three lines of railway, of a total length of 104 miles, are in course of construction; the chief to connect D'Urban with the capital.

The principal articles of export from Natal are wool, sugar, ivory, and hides. The wool exported to Great Britain in 1875 was valued at £514,310, and weighed 8,328,524 lbs. The total value of exports for the same year was £985,695. The exports comprise cotton, ivory, sugar, coffee, arrowroot, wool, hides, feathers, molasses, and rhinoceros horns. The value of imports in 1875 was £1,268,838. The revenue of the colony in 1880 was £582,715, principally raised from custom duties, transfer dues, and taxes on native huts, etc. In 1843 the value of imports was £11,712, that of exports £1261, while the revenue was only £12,000. Natal's productions were very respectably represented in the great exhibition of 1862, and formed one of the most interesting of British colonial compartments. The population consists of Dutch Boers, who remained in the country after it became a British colony; of English and German settlers; and the remains of the Zulu tribes, who originally possessed the country. It numbered, in 1880, 404,363, of whom 25,271 were whites. The natives, the most industrious of the Kaffir races, possess horses, cattle, sheep, etc., valued at £1,500,000, and, properly managed, make excellent servants.

The total tonnage of the vessels that entered and cleared the port of Natal in 1875 was

137,227 tons, of which 121,322 were British. The discovery of diamond-fields on the Vaal river is an event in which the colony is deeply concerned.

The large animals are gradually disappearing, although elephants are still occasionally met with in the dense bush of the coast region. Lions, leopards, wolves, and hyenas still hang on the outskirts of civilization. The smaller antelopes are plentiful, and alligators are met with in nearly all the rivers north-east of the Umzimculu. Natal, besides several poisonous snakes, produces a small species of boa, which sometimes attains a length of 16 feet. The hippopotamus is still found near the mouths of the rivers on the eastern frontier.

The botany of this region resembles that of Kaffraria proper, although generally of a more tropical character. All the timber-trees of the Cape Colony are found here, besides many new ones. The climate of the coast region, however, is too warm for the grape, at least for the purpose of wine-making.

Brook's *Natal*, by Mann (1869); Hall's *South African Geography;* Noble's *The Cape and South Africa* (1878); Kermode's *Natal* (1882).

NATAL, or Rio Grande do North, a fortified sea-port of Brazil, capital of the province of Rio Grande do Norte, and built on low lands about three miles from the mouth of the river of that name, 100 m. n. of Parahiba. Pop. 10,000.

NATAL, John William Colenso, D.D., Bishop of, a divine of the church of England; was b. in 1814, and educated at St. John's college, Cambridge, where he graduated as second wrangler and Smith's prizeman in 1836. From 1838 to 1842 he was one of the masters of Harrow school, and for the next four years tutor of St. John's college. In 1846 he was appointed rector of Forncett St. Mary, in the co. of Norfolk, and in 1854 first bishop of Natal, South Africa. The works by which he was, until recently, most widely known were his two treatises on algebra and arithmetic. The treatise on algebra was first published in 1849, and that on arithmetic in 1853. They soon acquired great popularity, and have been adopted as text-books in many of the principal schools and colleges in Great Britain. He has also published other educational works. He first attracted public notice, however, by the dedication of a volume of sermons to the rev. Mr. Maurice (q.v.), at the moment when that gentleman was in disgrace with the "orthodox" section of the religious world. His affection and respect for Mr. Maurice were further shown by his edition of the *Communion Service, with Selections from Writings of the Rev. F. D. Maurice* (1855). In the same year appeared his *Ten Weeks in Natal;* in 1861 his *Translation of the Epistle to the Romans, commented on from a Missionary Point of View;* and *A Letter to his Grace the Archbishop of Canterbury, upon the Question of the Proper Treatment of Cases of Polygamy, as found already existing in Converts from Heathenism,* in which he recommends, on grounds both of reason and Scripture, that converts to Christianity, already possessing several wives, should *not* be forced to put them all away, except one. He admits that monogamy is most in harmony with the genius of Christianity, but would enforce it only in the case of those who married *after* their conversion. The outcry raised by his professional brethren against the *Letter* was sufficiently loud, but it was nothing to the tempest of disapprobation that burst forth in the following year (1862), when he published *The Pentateuch and Book of Joshua Critically Examined,* in which he endeavored to prove that, as they stand, these books are not the products either of the age to which they are usually assigned, or of the authors whose names they bear; and that they are not entirely historical, but in many most important passages are overlaid with legendary, mythical, and symbolical incidents. Part VII. of this work was published in 1879. The bishop of Cape Town, the metropolitan bishop, declared Colenso deposed from his see; but on an appeal to the privy council in 1865, the deposition was pronounced null and void. In 1874 Colenso visited England to plead the cause of Langalibalele (see Natal). Other works by the bishop are *Natal Sermons* (1866) and *Lectures on the Pentateuch and the Moabite Stone* (2d ed., 1873). He edited, 1879, Cetshwayo's *Dutchman.*

NA'TANT. See Naiant.

NATATO'RES (Lat. swimmers), the name given by Illiger and many other ornithologists to the order of birds called *palmipedes* (q.v.) by Cuvier.

NATCHEZ, a tribe of Indians who formerly occupied the country including the site of the present city of Natchez, and who, when discovered by the Spaniards in the latter part of the 16th c., possessed a civilization far in advance of other tribes in their neighborhood, and in some particulars exhibiting the characteristics of the Aztecs. They were sun-worshipers, and preserved the custom of maintaining a sacred fire in their temples perpetually burning. Their ancestry was mythical, but they were ascribed to the Huaxteco Maya family. They were brave, but possessed many vices; and although they established and sustained friendly relations with the French, which were seldom interrupted, they were in 1729 guilty of an act of treachery towards the latter, in organizing their wholesale massacre on account of some fancied harshness of treatment at the hands of the French commander, which brought about a general war. The French, with the assistance of the Choctaws, attacked and destroyed a large portion of the tribe, and sold as many as 400 into slavery, driving the remainder over the Texas border. The remnant of the Natchez, about 300 in number, at present live in company with the

Chickasaws and Muskogees, and continue to retain their ancient form of organization and certain of their customs and rites.

NATCHEZ, a city and port of entry in Mississippi, on the e. bank of the Mississippi river, 280 m. n. of New Orleans. It is finely situated on the bluff, 150 ft. high, which here forms the bank of the river. A portion of the town at the bottom of the bluff is called Natchez-under-the-Hill, and was formerly the resort of the river gamblers, pirates, and other desperate characters. The city has eight churches, a court-house, jail, U. S. marine hospital, a daily and two weekly papers. It is the shipping port of a large and fertile cotton district, and has steamboat connections with the whole Mississippi valley. Natchez, which derives its name from a noted tribe of Indians, was settled by the French in 1716 and destroyed by the Indians in 1729, who were subsequently defeated and banished to the West Indies. Pop. '80, 7,058.

NATCHEZ (*ante*) is in Adams co., and in population is the second city in Mississippi. It has a historical record full of vicissitudes. Its site was chosen by the French in 1700 as the chief place of a number of proposed settlements in the lower Mississippi territory; and it was a French military and trading post 63 years, when it passed into the hands of the British. Next, it was occupied by the Spaniards; then by treaty in 1798 it came into the possession of the United States, and became the capital of the state. Seventeen years later, however, the seat of government was removed to Jackson. It has been laid in ruin once by a tornado, and was captured during the civil war by Farragut. It was formerly the residence of many wealthy planters, and is still a typical southern city, with broad, handsomely laid-out streets, and residences adorned with large gardens. The annual shipment of cotton is usually from 13,000 to 20,000 bales.

NATCHITO'CHES, a tribe of Indians of the Huaxteco-Maya family, presenting the same characteristics as the Natchez, and who formerly inhabited lands along the Red river in Louisiana. Here, on an island, they possessed a fortified town, which they were forced by the Natchez to evacuate, when the latter were expelled by the French from their own territory in 1731 and forced to flee into Texas. The Natchitoches united with the Caddoes, with whom the few of them who still exist continue to live.

NATCHITO'CHES, a parish in n.w. Louisiana, bounded on the e. by Saline bayou, and drained by Red river; 1200 sq.m.; pop. '80, 19,722—19,473 of American birth, 12,080 colored. The surface is mostly level and heavily wooded, and there are several lakes. The soil, especially in the river bottoms, is fertile. The principal productions are Indian corn, cotton, and sweet potatoes. Other staples are cattle and wool. Co. seat, Natchitoches.

NATICIDÆ, a family of gasteropod mollusks, of the section *branchifera*, order *prosobranchiata*, sub-section *holostomata*. See INVERTEBRATE ANIMALS. This sub-section also includes the periwinkles, river-snails, top-shells, ear-shells, tooth-shells, and limpets. In *naticidæ* the shell is globular, of few whorls, small spire, outer lip acute; foot very large; mantle lobes hiding more or less of the shell. The most important fossil genus is *natica*, in which the shell is thick, smooth, and polished, often with colored markings. Fossil naticæ have been found in upper Silurian, Devonian, carboniferous, and Permian formations, and they are abundant in the triassic, Jurassic, cretaceous, and tertiary. The family is extensive, and is distributed throughout all seas. The following genera are now recognized: *natica*, *surinatia*, *neverita*, *polinices*, *mammilla*, *cernina*, *amaura*, *amauropsis*, *naticina*, and *sigaretus*, most of the species belonging to these genera being found on the American coasts. They are carnivorous, feeding upon other mollusks, and also upon dead fish. The teeth, situated upon the lingual ribbon, enables them to perforate shells. Some of them make a peculiar nest in the sand, in the shape of a bowl, in which the eggs with their embryo shells are contained, each in a small cell; and they were formerly mistaken for corals.

NATICK, a t. in Middlesex co., e. Mass., 17 m. from Boston and 4 m. from Framingham; incorporated 1781; on the Boston and Albany railroad, the terminus of a branch road to Saxonville; pop. '80, 8,480. Lake Cochituate lies directly n., between this town and Wayland. The Charles river waters its s. portion. It was for several years the residence of Henry Wilson; has a public library of 10,000 vols. in an elegant building, excellent schools, a weekly newspaper, a national bank, a savings bank, water-works, and gas-works. Its leading industries are the manufacture of hats, base-balls, and shoes, and it is celebrated for its extensive boot and shoe manufactories. Farming and market gardening are carried on to some extent. In the cemetery is a monument to John Eliot, who brought the settlement of "praying Indians" from Nonantum to Natick in 1651, and established a church there in 1660, which flourished for many years, on the site of which the Unitarian church now stands. The town includes Felchville and South Natick, each having churches and schools, the latter a museum of natural history and a shoe factory.

NATION (Lat. *natio*, from *natus*, born), a word used in two distinct senses. 1. A state or independent society united by common political institutions; 2. An aggregate mass of persons connected by ties of blood and lineage, and sometimes of language.

The modern dogma of nationalism, as maintained by a class of continental politicians, starts from an assumption that a nation in the latter sense ought necessarily to be also a nation in the former, and endeavors to assign limits to the several races of Europe, with the view of erecting each into a distinct state, separated from other states or nationalities. The extreme politicions of the national school seem to consider the supposed rights of nationalities as paramount even to the obligations of treaties, and the political conjunction of one nationality with another is looked on by them as an adequate ground for a revolt or separation, apart altogether from the question whether the nationality is well or ill governed. In point of fact, the different races in Europe are so commingled, that any reconstruction of the political map of Europe, on ethnological principles, would be impossible, even if desirable. The blood of nine-tenths of Europe has been mixed within the historical period. The test of language, on which nationality has sometimes been based, is a deceptive one, in so far as it is indefinite and perpetually fluctuating. The people on the frontier between two races, as in the south Tyrol, generally speak two languages. Then we have dialects, like the Walloon, the Grödnerisch of the Tyrol, and the Romansch of the Grisons—as also the Breton, Welsh, Gaelic and Irish languages, which could hardly be made the basis of independent communities. The well-being of the people governed is properly the end of all government, and it has practically not been always found that a state is better governed when it consists of one race only, than when it includes an aggregate of races. Highly diversified nationalities may be united in one political system, provided only that the government respects and consults the peculiarities of the several races and does not attempt to force the usages, habits, or language of one on the rest. See Ethnology.

NATIONAL CONVENTION, an assembly of deputies of the people, which assumed the whole government of France on the overthrow of the throne in 1792. When the national assembly (see Assembly, National) had decreed the suspension of the king, Aug. 10th, 1792, it appointed the election of the national convention, which commenced its sittings Sept. 31st. Its first act was to declare France a republic, Sept. 25th. Upon this followed the trial and condemnation of the king. Through the support of excited mobs, the extreme Jacobin party became predominant in the convention; where, from the elevated seats on which its members sat, it received the name of the *mountain* party. The *revolutionary tribunal* was established; the chief administration of affairs was intrusted to the *committee of public safety*, which exercised the most despotic powers. The Girondists (q.v.), at first a powerful party in the convention, were destroyed, many of them perishing by the guillotine; and a new constitution, thoroughly democratic, was adopted Aug. 10th, 1793; but its operation was suspended until peace should be restored. Meanwhile, the actual rulers of the country displayed marvelous energy; almost a million of citizens being placed under arms, and immense provision of all warlike stores made by means of requisitions. They also proceeded with merciless severity against their political opponents, dealing with them as traitors; hundreds of thousands were thrown into prison; and the number who died by the guillotine increased daily both in Paris and throughout France. The national convention itself latterly became subject to the dictatorial power of Robespierre; many of its members were guillotined within a few weeks; and independent opinion was no longer expressed. The overthrow of Robespierre was followed by a great reaction; the Jacobins were suppressed; and finally, the national convention, after concluding peace with Prussia and Spain, dissolved itself Oct. 26th, 1795 (4th Brumaire of the year IV.), leaving to the nation a new constitution which placed the government in the hands of a directory (q.v.).

NATIONAL COVENANT. See Covenant.

NATIONAL DEBT. See Debt, National.

NATIONAL EDUCATION. The general subject of education has been already treated under that head. By the term "national education" is understood (1) the means taken by the body of any nation, either through the state or other organizations, for educating the people ; (2) the objects which the nation ought to place before itself in its educational measures. These questions involve the whole inner and outer history of education, and are far too large and important to be capable of such treatment here as would convey accurate notions to the reader. All we can do is to glance slightly at the history of the two branches into which the subject divides itself. Among ancient nations, and among not a few nations now existing, education in any definite sense did not, and does not, exist for the masses of the people. The children grow up in reflective or unreflective imitation of their fathers. But at all times, nations which have quite emerged from the savage state, have had some more or less organized scheme of education for the leisured and governing classes. The purpose kept in view in such education has been to fit the pupils to discharge certain duties of war or government. In addition to this, the priesthood had the education which their traditionary hymns, laws, and customs afforded. That man as such, apart from any special practical ends, should be educated, was an idea late of being recognized, and occurred first to the Greeks, to whom the world owes so much. But neither among them nor their imitators, the Romans, was the education of *the masses of the people* ever contemplated. Education, properly so called, was confined to a few. In the centuries which succeeded the introduction of Christianity, the

church was the great educating body—training those intended for the service of the altar, not only in Christian doctrine, but in all the learning of the past. This, at least, was the general tendency of education in the church. But it was not till the reformation in the 16th c. that learning, even to the limited extent of reading and writing, was considered a worthy object of pursuit by any save those who, in some form or other, were destined to be drawn within the clerical ranks. The reformation introduced the idea of educating the masses of the people—the leaders of this movement being, no doubt, forced to this conclusion by the necessity which their view of man's personal religious obligations imposed on them. It was manifestly a corollary from the position they took up that *every man's* intellect should be so trained as to be able to read, and inquire, and think for itself. It was only very slowly that so large a conception of the sphere of education could be given effect to. Gradually, however, popular schools arose in many parts of the continent of Europe, especially in Germany, and the number of gymnasia or grammar-schools was, during the same period, increased. In Scotland, so early as 1696, the government took up the matter, and ordained that there should be a school as well as a church in every parish, at the same time providing for their maintenance by a tax on land, and for their management by putting them under a certain number of those who paid the tax conjoined with the minister of the parish—all being subject to the presbyteries within whose bounds they were situated. The example of Scotland cannot be said to have been followed on anything like a national scale by any country till after the French revolution had exhausted itself. Since 1815, the distinguishing idea of government administration may be said to be the necessity of educating *the people, and all the people*—even the outcast and the criminal. During the last fifty years, all the German states, and more especially Prussia and Saxony, have developed excellent national systems of education, and France has followed their example. Russia and the new kingdom of Italy are also now organizing primary instruction; and at the same time, as in all European countries, they are making provision for the instruction and professional training of the teachers in normal schools (q.v.) The schools for instructing the middle classes, and grammar schools (French, *lycées;* German, *gymnasiums*), whose object is to prepare pupils for the universities, have received increased attention. Universities themselves, too, have been further developed, their curriculums extended in range, their objects elevated, and their number increased.

To return to primary instruction. In England there was no national system, properly so called before 1870, but voluntary efforts were largely aided by the state in the form of privy council grants. These grants were also extended to Scotland, as it became necessary to supplement the parochial schools there, owing to the increase of population. The principal conditions on which these grants were made were that they were only to *supplement* local efforts, that the schools should pass a satisfactory examination before a government inspector, and that the Bible should be read in them. As much additional religious instruction might be given as the school managers pleased, but no schools were admitted to privy council aid from which the Bible was excluded. Under the stimulus afforded by these grants, the educational wants of England were, after 1839, to a great extent supplied; but many districts were left unprovided with schools, and many more very badly supplied. In 1870 an important measure, entitled "An act to provide for public elementary education in England and Wales," was passed by parliament, according to which it is enacted that "there shall be provided for every school district a sufficient amount of accommodation in public elementary schools available for all the children resident in such district, for whose elementary education efficient and suitable provision is not otherwise made." It is enacted further, that all children attending these schools whose parents are unable, from poverty, to pay anything towards their education, shall be admitted free, and the expenses so incurred be discharged from local rates. The new schools are placed in each district under "school-boards" invested with great powers—among others, that of compelling parents to send their children to school. An act in most respects similar to the above was passed in 1872 for Scotland, whose educational wants had previously been well supplied.

In Ireland, a national system, instituted and maintained by the state, exists, and one of its main features is the separation of the religious from the secular teaching—at least in theory. The extent to which this principle has been encroached upon in the course of working out the scheme, is not accurately known, but is worthy of special inquiry.

In the British colonies, as in the U. S. of America, adequate state systems of education have been provided on the basis of the secular principle. See the articles National Education, and Privy Council, Committee of, on Education.

NATIONAL EDUCATION, Systems of, the provision made by various states for the education of their citizens. In England the term national education is commonly used as implying only a provision made for the instruction of children of the poorer classes. But it is capable of a much more extensive application, and in most of the countries in which the state provides for the education of the people, the state regulates, more or less, all instruction, from that of the primary school to that of the university. In England, national education in this sense has no existence. The parish schools (q.v.) of Scotland at one time were all but national, but the altered circumstances of the country

gradually deprived them of that character. The imperfect means adopted to supply the deficiency in both parts of the kingdom are described under the head of PRIVY COUNCIL, COMMITTEE OF, ON EDUCATION. See also SCHOOLS, PUBLIC AND GRAMMAR; INDUSTRIAL SCHOOLS; REFORMATORY SCHOOLS, etc. In Ireland the foundation of a really national system was laid in 1833 in the "national schools" (supplemented since by the queen's colleges and university), the principle of which is briefly stated under IRELAND. These schools have exhibited a steady and even surprising progress, when we consider the determined opposition they have met with from powerful ecclesiastical parties, both Catholic and Protestant. In several of the British colonies the local legislatures have boldly dealt with the question on the national principle, in opposition to the denominational. See VICTORIA.

In this article we propose to give some account of the national system in various countries, and to indicate some of the matters as to which we have to look for instruction to foreign experience. Before doing so, it may be well to notice the obstacles in the way of the establishment of national education among ourselves. And first, in Great Britain the establishment of a national system of education, and of all interference with education on the part of the state, has until lately been opposed upon principle by a numerous and respectable body of politicians. They, for the most part, consisted of dissenters, who, beginning with voluntaryism in ecclesiastical matters, had passed on to the doctrine of *laissez faire* in politics. The others were chiefly speculative persons, deeply imbued with the same doctrine, who, profoundly disbelieving in the wisdom of statesmen and the capacity of officials, and apparently in the possibility of foresight in large affairs, held that the state should undertake as little as possible, and leave things to what they called their natural course. The arguments used by these two classes were not always alike. Individuals of the former class were apt to go back to the religious ground from which they started, maintaining that education ought to be religious, that the state ought not to teach religion, that therefore education was out of the province of the state. But what the spokesmen of both classes most insisted on was this: that education should be left to the law of supply and demand, or rather, to the voluntary action of individuals, single or combined. It was in that way, they declared, that the education of the people could be most beneficially carried on; for so carried on, it would always be, both in kind and in extent, what, on the whole, the circumstances of the people required. In the hands of government, they said, an educational system must be, more or less, an instrument of state. And, at the best, the extent and the quality of the instruction provided must depend upon the will of persons who might be very ignorant of the wants of the people. They used declamation about the bad way in which governments did everything they attempted; about the danger of creating a host of new officials; and about the impropriety of interfering with natural laws, and of discouraging voluntary agency. Then they enlarged upon the great progress which education had made in England since the beginning of this century, independently, as they said, of the state—maintaining not only that it had been as great as the circumstances of the country permitted, but that it was almost as much as the state had accomplished in any country; and that it proved that in England, supply and demand, or the voluntary principle, would soon provide for the education of the whole people. The greater part of the increase in the supply of education, so far as it was not due to the action of the state, had come from the benevolent exertions of individuals. But their chief reliance was upon the agency of individuals or societies inspired by benevolence or religious zeal. They held that the same objections did not apply to voluntary organizations which lay against the state; they declared that it was the great glory of England to accomplish, by such means, things which elsewhere were attempted only by the state. Combined voluntary action, they said, was consonant with the national habits and institutions; it was a part of the system which had made the English a free, self-reliant, and enterprising race; it should be fostered, not discouraged; and it was worth our while to pay a price, if necessary, rather than let it be superseded by the action of the state.

It was answered, first, that the commercial principle of supply and demand, unless supplemented by the benevolence of individuals, could not be expected to educate the people except by very slow degrees; that education must create the demand for education; that children of the lower classes in large towns, unless assistance or stimulation came to them from without, had at present no more chance of receiving instruction than if they were living in Africa. And the nation would lose incalculably by delay in educating the masses; for nothing would so greatly increase its power and prosperity, so materially improve the condition of the humbler classes, as the education of the whole people. The importance of voluntary agencies was admitted; but why was the state to be precluded from at least co-operating with them? The state, it was said, had a greater interest in educating the people than any of her citizens could have; and, moreover—this was the real question—could undertake it more successfully. Voluntary agency, it was maintained, was too slow, too uncertain, too spasmodic in operation, to be permanently and solely relied upon in a matter of such great national concern. The friends of state action confidently appealed to the experience of foreign countries as showing the superior efficiency of state education, and pointed to the effects which government stimulation, on a limited scale, had had at home. It is now several years since this controversy was at its height. The voluntaries have since that been acquiescing in the inter-

ference of the state with education; and recently, several of their foremost men have frankly admitted that they had been mistaken, and that the state, by what it has done for education, has made good its claim to the regulation of it. The course of political events has recently added greatly to the importance of popular education; and at present it may be said that there is practically no opposition upon principle to the control of education by the state.

There have always, however, been obstacles to the establishment of a national system more formidable than the opposition of private bodies, and these are well-nigh inevitable.

The most important of them are those which are concerned with the place, if any, to be assigned to religion in the school instruction. Upon this matter there is a conflict of opinions which seems almost irreconcilable. A party, which is growing in numbers, and which is respectable from its activity and intelligence, holds that the state should give nothing but secular instruction; that religion is beyond its province, and should not be taught within its schools; that, indeed, with a population divided into numerous sects, a practicable scheme of state education embracing religion cannot be devised. To this party a portion of the English voluntaries now seems disposed to ally itself. There are others who believe it possible to teach an undenominational Christianity in schools; who desire that the state schoolmaster should confine himself to this; and that dogmatic teaching should be left to the religious bodies. A third party hold that dogmatic teaching should be given in state schools; that religious teaching, to have any value, must be dogmatic; but that arrangements might be made for the religious instruction of children by persons of their own persuasions; and, at any rate, that children should be exempted from the religious instruction given in a school if their parents should so desire. The most numerous body of all are satisfied with the system of aiding denominational schools which now exists; because they approve of schools being, as for the most part they now are, under clerical supervision, and fear that by any change the influence of the clergy upon education would be weakened. Among the managers of church of England schools fault is scarcely found with more than one point in the old substitute for a system; there was an incessant agitation against the "conscience clause," which the state has placed among the conditions of its aid, stipulating that religious instruction should not be given contrary to the wish of the parent. Between the denominationalist and the secularist there is a difference which scarcely admits of compromise, and is a serious hindrance in the way of any national system. The former is naturally opposed to any scheme for supplementing the denominational system—for the purpose of educating the classes which this system does not educate—unless it include religious teaching.

The question of religious instruction has been found a troublesome one in nearly every country where the state regulates education, and there is nothing more instructive, in foreign experience, than the ways in which, in different systems, this difficulty has been disposed of. Next to this, the most important thing to be observed is the parts which, in different systems, are assigned to the state and to the locality respectively; for it is unquestionable that there are some dangers attaching to state education, when the influence of the state is predominant, and that the function of the state in education must be carefully defined. By the mere selection of school-books, the state could powerfully influence the rising generation; and in Austria, and, it is said, in France also, the school has been made use of as an instrument of state policy. With a popular government, however, there is not much risk of it being used for sinister purposes; and in this country we are in more danger of having recourse too little to the powers of the state than of trusting it too much. The possibility of making education compulsory is another matter upon which foreign systems of education throw much light: we are perhaps more interested in noting how far indirect methods can be resorted to for compelling attendance at the schools. Upon the limits of the instruction which should be attempted in schools for the poorer classes—a subject which has been much discussed in connection with the Revised Code of 1861—and upon the results of government regulation of the middle and upper schools also, there is much to be learned from the foreign educational systems. We begin with

State Education in Holland.

There are several countries in which—if school statistics could be taken as a test—popular instruction is more widely diffused than it is in Holland; but in no European country is it so uncommon to meet a man who cannot easily read and write. The primary schools of Holland have a high reputation for the solidity of the instruction they impart, and have, by competent observers, been declared to be the best in Europe. A small and wealthy state—rich, too, in the public spirit of its citizens—with a population singularly docile and orderly, the task of educating the people has been for Holland exceptionally free from difficulty. It had the start of most other European nations in the work of popular education. So far back as 1811 its primary schools had been celebrated in a report by the famous Cuvier. It has had an education law since 1806; and of this law, though it underwent modification in 1857, it is necessary to give some account. Secondary education in Holland was officially instituted and organized for the first time by the law of May, 1863.

On the face of it, the law of 1806 seemed far from making a complete provision for

the education of the people; it left much—in any other country, it would have been a great deal too much—to the public spirit of local authorities. It did not make education compulsory; it did not even enforce the establishment of public schools; but it provided for two things being done thoroughly—the inspection of the schools and the examination of the teachers—and to this seems to have been chiefly due its eminent success. Each province of Holland was formed into a certain number of school-districts, and over each school-district was placed an inspector. The inspector was made supreme over primary instruction in his district. He was a member of every school-committee, and school-committees could be named only with his concurrence; no teacher, public or private, could exercise his calling without his permission; and he inspected every school in his district twice a year. The united inspectors of the province formed the provincial commission for primary education. This commission met three times a year, and received from each of its members a report upon his district; once a year, it sent a deputy to the Hague, to form with the deputies from other provinces, a commission to discuss and regulate school-matters, under the direction of the minister for the home department and his inspector-general. The inspectors in the various provinces were appointed by the home office, on the presentation of the provincial commission. It has been said that in Holland public spirit is very strong. State employments are thus deemed very honorable; and the inspectors gave their services gratuitously—receiving only an allowance for expenses. It was one of the duties of the provincial commission to examine teachers for certificates. First, the teacher had to get a *general admission*—a certificate of competency, admitting him into the teaching profession; he had to get a *special admission* also, before he could exercise his profession. There were four grades of certificates—the first or second grade had to be obtained by a school-master, public or private, in the towns; the third grade qualified for a village school; the fourth grade was for under-masters and assistants. To the highest grades were admitted those candidates only who gave signs of a *distinguished culture*. For public masterships, when they fell vacant, a competitive examination was held; the successful candidate received his *special admission*—his appointment to exercise his profession in the school. For special admission as a private teacher, there was no second examination; it was in the power of the municipality, with the concurrence of the inspector, to grant it upon application. Although there were no obligatory provisions in the law, the provincial and communal administrations were charged by the government to provide the means of instruction in their localities, to insure a comfortable subsistence for teachers, and to obtain a regular attendance of the children in the schools; and they did all this to the best of their ability. Free schools for the poor were provided in the towns; in the villages, schools to which the poor were admitted gratuitously. Every effort was used, both by the lay authorities and the clergy, to draw poor children into the schools; and the school-masters were provided with incomes much superior to what is usually paid to school-masters in any other European country. To this M. Cuvier attributed much of the success of the Dutch schools. Some of the best scholars were kept in the school to assist in the teaching; they became under-masters, and eventually masters; and thus, even before the institution of normal schools, an efficient body of teachers was provided. In the normal schools which were afterwards established, school-methods and the practice of teaching formed a more prominent part of the instruction than in those of other countries. It soon appeared that the free schools for the poor in towns were giving better instruction than could be obtained by the lower middling classes; and intermediate schools had to be established in the towns (*tusschen-schoolen*), in which, for a small fee, an excellent education was provided. Above the intermediate school was the French school, in which, besides a sound commercial education, modern languages were taught; above that was the Latin school, giving a classical education, and preparing for the universities. The classical schools and the universities of Holland do not receive from foreign observers the commendation so freely bestowed upon the other parts of the educational system of the country.

Under this law, the public schools were non-denominational; no dogmatic instruction was to be given by the teacher or in the school; but the instruction was to be such as to "train its recipients for the exercise of all social and Christian virtues." The religious education of the children, however, was not overlooked. The government exhorted the clergy of the different communions to take upon them the religious instruction of children of their own persuasions; and this the clergy willingly did—giving up a portion of every Sunday to this duty. The school-master instructed the children in the truths common to all religions, and on Saturdays, when the Jews were absent, in the New Testament and the life of Christ. M. Cuvier, in 1811, stated that he found the education religious, though not dogmatic; and in 1836, high satisfaction with it was expressed by M. Cousin, an earnest advocate of religious education. It was thought that the Dutch schools had proved the possibility of teaching in schools an unsectarian Christianity. But it was chiefly upon this point that the controversy arose which led to the enactment of 1857; and as regards it, it cannot be said that the controversy is yet ended.

There were other matters which excited a demand for the alterations then made in the law. The constitution of 1848 had granted the liberty of instruction, and was therefore in conflict with the law of 1806. The school-attendance had been falling off. Some of the municipalities had been evading their duty to the school-masters and the schools.

It was thought desirable that the duties of the commune in regard to education should be carefully defined by law. The changes made, however, were not of much practical importance.

The law of 1857 granted "liberty of instruction;" still requiring from the private teacher the certificate of competency, it rid him of the veto of the municipality and the inspector. It expressly prescribes that primary schools, in each commune, shall be at the commune's charge; they are to be in sufficient number; and the states' deputies and the supreme government are to judge whether, in any commune, they are in sufficient number or not. If the charge of its schools is too heavy for a commune, it receives a grant in aid, of which the state and the province each contributes half; but there is no fixed point at which the commune can demand this aid. The law fixes the minimum salary for a schoolmaster at 400 florins (about £34); for an under-master at 200 florins. (The schoolmaster's salary, however, is usually much higher; in towns, not unfrequently four times as much.) It provides that when the number of scholars exceeds 70, the master is to have the aid of a pupil-teacher; when it exceeds 100, of an under-master; when it exceeds 150, of an under-master and assistant; for every 50 scholars above this last number, he is allowed another pupil-teacher; for every 100 scholars, another under-master. School-fees are to be exacted only of those who can afford to pay them; and the municipalities are enjoined to "provide as far as possible for the attendance at school of all children whose parents are in the receipt of public relief." The law defines the subjects of primary instruction as follows: Reading, writing, arithmetic, the elements of geometry, of Dutch grammar, of geography, of history, of the natural sciences, and singing. There is still a competitive examination for the office of public schoolmaster; a list of those who have acquitted themselves best is made up by the inspector and a committee of the communal council, and from this list the selection is made by the whole body of the council. For the provincial commission, consisting of the inspectors of the province, there has been substituted a salaried provincial inspector; and the provincial inspectors are assembled once a year to deliberate upon the state of primary instruction. The minister of the home department, assisted by a referendary, is the supreme authority in matters connected with education.

Upon the subject of religious instruction, the law was left unaltered. The enactment of 1857 provides as follows: "Primary instruction, while it imparts the information necessary, is to tend to develop the reason of the young, and to train them to the exercise of all Christian and social virtues. The teacher shall abstain from teaching, doing, or permitting anything contrary to the respect due to the convictions of Dissenters. Religious instruction is left to the different religious communions. The schoolroom may be put at their disposal for that purpose, for the benefit of children attending school, out of school-hours." This was the conclusion arrived at, after much excited discussion.

In 1848, all religions were, in Holland, placed by the law on a perfect equality; and immediately thereafter, an attack was begun by the Roman Catholics on the religious instruction of the schools. Professedly neutral, they maintained that it was really Protestant, and probably they were right. The schoolmasters, on the demand of the Roman Catholics, were enjoined to comply mere strictly with the law; and thereupon there began among the orthodox Protestant bodies a violent agitation against the law—a movement for connecting every public school with some religious communion. The Roman Catholics, believing that in Holland neutral schools must be Protestant, desired that the instruction should be purely secular; and a considerable party among the Protestants contended for the same object. The only party in favor of the existing law were the rationalist or new-school Protestants, who attach more importance to the moral and civilizing side of Christianity than to its dogmatic aspects. Between the benominationalists on one hand and the secularists on the other, the victory fell to this last party. Of course, the decision was a compromise; and neither the high Protestant party nor the Roman Catholics regard it with satisfaction. The consequence has been that, advantage being taken of the newly-conceded freedom of instruction, there has been a great increase in the number of private elementary schools conducted on the denominational basis. The non-denominational school in Holland cannot be considered entirely successful, since the opposition to it seems to be leading to primary education being to a considerable extent taken out of the control of the state.

State Education in Switzerland.

In no part of Europe has the education of the people been more successfully prosecuted than in Switzerland. In all the cantons, French and German, it has been carefully attended to by the governing bodies; and for small communities, provided the rulers have intelligence and public spirit, it is comparatively a simple and easy task. To those who are interested in school-methods and school-management, nothing can be more instructive than the education of the German cantons. Their primary schools are unsurpassed; those of the canton Aargau have a reputation of being the best in Europe. The experience of the French cantons throws light upon more than one of the questions which occur in the construction of a national system. It is with the latter class of questions that we are concerned; and to the French cantons—Geneva, Vaud, Freiburg, Neufchatel, and Valais—the following statement is confined.

In these five cantons, the school-system was, until recently, the same in its main out-

lines; it was a system designed to put public education in harmony with the democratic constitutions established after the war of the Sonderbund. In Vaud, it was founded in 1846; in Geneva and Freiburg, in 1848; in the Valais, in 1849; and in Neufchatel, in 1850. In Freiburg, it underwent modification in 1856. Its main features were as follows: The communes were required to provide and maintain public schools, the state assisting them when the charge became too heavy. In general, every place with more than 20 children of school-age was required to have its school; every place with more than 50 or 60, a second school; and so on. Infant-schools were recommended and aided by the state, but their establishment was not made obligatory. The council of state—the supreme executive—of the canton appointed a board of public instruction to exercise the government of education; but in important matters, an appeal lay from this body to the council; and by the council only could a master be dismissed. The municipality appointed a communal school-committee, which had the local superintendence of the schools. Ministers of religion were eligible for this body, but were not members of it by virtue of office. It was the duty of the school-committee to visit the schools of its commune not less than once a fortnight, besides holding a public general examination of them once a year. The teacher required to get a certificate of capacity; the examinations for the certificate being under the management of the board of public instruction. In Vaud, however, five years' service in a public school exempted a teacher from the obligation of a certificate; and in other cantons, it does not seem to have been rigidly insisted on. For vacant masterships, there was a competitive examination, to which persons qualified by certificate or service only were properly admitted; in Vaud, however, failing qualified persons, other candidates might be admitted to examination, and provisionally appointed. In Geneva, Freiburg, and Valais, there were school inspectors who periodically reported to the board of public instruction; Vaud and Neufchatel had no inspectors; the duty of inspection in these cantons devolved upon the school-committee. The subjects taught were religion, reading, writing, grammar, arithmetic and book-keeping, geography, Swiss history, and singing. The instruction given had two or more degrees (in Geneva, six degrees), according as these subjects were taught with more or less extension; instruction in both degrees being usually given in the same school, and by the same master. Education was to be based upon the "principles of Christianity and democracy." Hours were to be set apart for religious instruction; from the ordinary school-lessons dogma was to be strictly excluded; and it was regarded as the province of the minister of religion, not of the schoolmaster, to give religious instruction, though the latter was not prevented from giving it in the room of, and under the responsibility of a minister. In all the cantons, except Geneva, educations was made compulsory; attendance at school was required from the 7th to the 15th, or from the 8th to the 16th year. If children were privately educated, the state must be satisfied that their education was sufficient; such children could be called up for examination with the scholars of the public schools, and if found inferior, might be transferred to a public school. A certificate of emancipation was granted when the obligatory course had been fulfilled. The law contemplated that the instruction should be gratuitous, and in Geneva and the Valais it was gratuitous.

In Freiburg the school-system was framed in no small degree for the purpose of strengthening the democratic party against the clerical party. It provided that no religious society should be allowed to teach; that persons educated by the Jesuits should be incapable of holding any office in church or state; it imposed a political oath upon the schoolmaster; it prohibited children from being sent to a private school, except with the sanction of the inspector and the school-committee; and if sent, required that they should come up for examination every half-year. At the same time it established an excellent programme of primary instruction. At the elections of 1856 the clerical party regained the ascendency in Freiburg; and in Jan., 1858, the council of state made a considerable alteration in the school-law. It reduced the programme of primary instruction; it made the clergyman a necessary member of the local school-committee, freed the teacher from the necessity of taking an oath, and relaxed the obligation of attendance at the public schools, giving parents liberty to educate their children at home or at private schools. In other respects, the system, as above described, has been maintained in Freiburg. There has been no change in the other cantons.

The law as regards religious instruction seems to work with tolerable smoothness. In Vaud, it appears that the laxity which prevails as to the requirement of a certificate sometimes leads to the admission of unqualified persons as teachers; and in Vaud and Neufchatel, complaint is made of the incapacity of the school-committee to make up for the want of professional inspection.

In the 4 cantons in which education is by law compulsory, the school-attendance is found to be no better than in Geneva, where it is not compulsory. In these cantons, the law provides that parents not sending their children to school are to be warned; if the warning be neglected, that they are to be summoned before the tribunals, which can punish them by fine or imprisonment. But it appears that, in point of fact, the tribunals are never resorted to; and that the authorities are careful not to insist upon more than the people are easily able and willing to comply with. In the Valais the school-year need not last for more than 5 months. In Freiburg the vacation may last for 3 months; and the inspector may exempt from attendance at school children who are sufficiently

advanced, and children whose labor their parents cannot do without. In Vaud, the local school-committee may grant to children above 12 years of age, whose labor is necessary to their parents, dispensations which in a great measure exempt them from attendance at school; the master may grant the scholar leave of absence for 2 days in the week; the president of the school-committee may grant him leave for a week at a time; the school-committee itself for a month at a time. It appears that in Vaud, the attendance at the schools had been steadily falling off from 1846, the date of the law, up to 1858; and the attendance of the children whose names were on the books was then reported to be by no means regular. New branches of industry which gave employment to children had been introduced into the canton; and the council of public instruction seems to have been compelled to sacrifice the law to the interests of families. The experiment of compulsory education cannot be said to have succeeded, because it has not really been made, in French Switzerland.

State Education in France.

At the head of the education of France is the minister of public instruction; he is advised and assisted by the imperial council of public instruction, a body the members of which are appointed by the crown for the period of a year. The minister, if he thinks fit, brings before the council for discussion projected laws and decrees on public education; he is bound to consult it respecting the programmes of study, methods, and books to be adopted in all classes of public schools. The minister has succeeded to the functions in respect of education which, under the first empire, were conferred upon the university of France; he is head of the university, the officials of which still perform a considerable part in the management of education, but do so under his control. As respects the higher and the professional education, the university is both a teaching and an examining body, granting degrees under conditions prescribed by the minister and council. The administration of the secondary instruction is committed to it, and it shares in the supervision of the primary instruction. It is composed of 18 *academies*, each of which comprehends several departments. These academies are so many local centers of the department of public instruction. At the head of each is a rector; the chief officials under him are called academy inspectors. The minister of public instruction is also rector of the academy of Paris.

The academy officials, under the control of the minister, have the superintendence of secondary instruction in the departments within the academy's jurisdiction; there is an inspector for each department. The instruction is minutely regulated, as to the quantity to be provided, as to the subjects to be comprehended in it, and as to its cost; it is the chief duty of the academy inspectors to see that the requirements with respect to it are complied with. The inspection is said to be highly efficient. The lyceum is the principal seminary of secondary instruction; in general the chief town of every French department has its lyceum. There is, besides, the communal college. Every town of considerable population has its communal college. The lyceum is founded and maintained by the state, with aid from the department and the communes; the communal college is founded and maintained by the commune, with occasional aid from the state. The instruction given in the communal college and in the lyceum is substantially the same in character; in the lyceum it is the more extensive. To the lyceum there is usually attached a preparatory school for the younger boys. In both lyceums and communal colleges there are boarders and day-scholars. French, Latin, Greek, and mathematics are the principal subjects of instruction; arithmetic, history, geography, modern languages, and the natural sciences are also taught. The course at the lyceum lasts for six years, and qualifies for the degree of bachelor of letters. Religious instruction is given—to the Roman Catholic boys by chaplains attached to the school; to the Protestants, by a Protestant minister specially appointed to this duty; and the New Testament in Greek or Latin is read daily by every class. In the lyceums, the average charge for day-scholars is from 110 francs (£4, 7s. 4d.) to 180 francs (£7, 8s. 4d.) a year; the charge for boarders from 800 francs (£32) to 900 francs (£36), according to their age and advancement. In Paris, the charges are higher—from £38 to £60 a year for boarders, and from $6 to £12 a year for day-scholars; on the other hand, there are lyceums where the highest charge for boarders is £22 a year. There are public scholarships (bourses) founded by the state, to be obtained by competition, the holders of which are relieved from all cost. The education given is in no respect much inferior—and in some respects it is superior—to that which is to be had at an enormous cost at the best English public schools; it is far superior to that which, at a far higher cost, is ordinarily given to children of the middle classes in England. A private secondary school cannot be opened without notice to the public authorities: they must be satisfied that the premises are suitable; and the director must have a certificate of probation—showing that he has served five years in a secondary school—and a certificate of competency obtained at the public examination for secondary teachers. The academy inspector inspects private secondary schools, but only to see that the pupils are properly lodged and fed, and that the teaching contains nothing contrary to morality and the laws. The minister may, however, dispense with the certificate of probation, and holy orders are accepted in lieu of the certificate of competency.

A law, dated June 21, 1865, founded a new course of study in secondary schools—a

special secondary instruction. The object of the special secondary instruction is declared to be to "found the sub-officers of industry;" instruction in living languages is substituted for the classical instruction of the secondary schools; the elements of science and its applications receive great attention—particular regard being had to the teaching of agriculture and the sciences which bear upon it. The teaching, moreover, is intended to impart what may be called a sound French education. A normal school has been founded at Cluny for the preparation of masters for this special secondary instruction.

For primary instruction in France an excellent basis was laid by M. Guizot's law of 1833, of which, indeed, the more important provisions have been retained. Since the re-establishment of the French republic education has repeatedly been the subject of legislation; in the main, the provisions as to primary education are regulated by the laws passed between 1850 and 1867. Every commune must maintain an elementary school, either by itself or in combination with other communes; in founding and maintaining its schools it is to be aided, if necessary, by the department and by the state. It must have taxed itself specially for the schools three centimes per franc of rental before it can claim aid; the department must have taxed itself specially two centimes for the communal schools before the state is resorted to. Up to the present year a certain number of poor children—the number determined for each school by the prefect of the department—were admitted to the school gratuitously; for others a fee was charged, which was collected every month by the tax-gatherer. The state contributed whatever was necessary in addition to the communal and departmental taxation and the school-fees. The law of the present year, however, provides that all children are to be admitted gratuitously whose parents would have difficulty in paying the school-fee; and that a commune whose taxation amounts to four centimes additional may dispense with the school-fee altogether, the deficiency, if any, so arising being made up by the state. In the large towns the schools have long been gratuitous—the communes often taxing themselves for school-purposes beyond the amount required by law. Up to the year 1867 the law did not oblige the communes to maintain separate schools for girls, though a large proportion of them contributed towards the maintenance of such schools. The law of 1867 provides for the establishment of girls' schools; the cost of them—the communal measure upon the state. Primary instruction was made absolutely free, 1881 ; obligatory, 1882.

Religious instruction is given in every school. In France, the Roman Catholic, the Protestant, and the Jewish forms of worship are subsidized by the state; and it is provided that, in communes where more than one of these is publicly professed, each form is to have its separate school. The departmental council, however, has power to authorize the union, in a common school, of children belonging to different communions. For such cases, it is provided that ministers of each communion shall have free and equal access to the school, at separate times, to attend to the religious instruction of members of their own flock. To a school appropriated to one denomination, no child belonging to another is admitted, except at the express demand of his parent or guardian, signified in writing to the teacher. Denominational schools are now the rule, common schools the exception. Previously to 1850, under M. Guizot's law, common schools were the rule, but it was found that in them the religious instruction presented grave practical difficulties. All the religious bodies appear to be satisfied with the present system. The schools, though denominational, are communal schools; the denominations have not the management of them; and they are all subject to the same inspection.

The mayor and the minister of religion in each commune have the supervision and moral direction of the primary school; in practice they are strictly confined to matters connected with its morality. Cantonal delegates are appointed by the departmental council (the canton is a division larger than the commune), who inspect the primary schools of their canton; but they have no real authority over the schools; they are only allowed to make representations as to the state of the schools to the departmental council, or to the inspector. The departmental council has the chief part in the regulation of the primary schools; moreover, no private primary school can be opened without its permission; and if it refuse permission, there is no appeal. It is the prefect, however, who has the power of nominating, suspending, and dismissing public primary teachers. His authority is usually exercised upon the report of the academy inspector—the university official whose important functions, in respect of secondary instruction, have already been described. The academies have the charge of the normal schools of primary instruction, and the supervision of the primary schools as regards the methods of teaching and course of study. Under them are the primary inspectors, who report to the academy inspectors; above the latter, as regards primary instruction, there are four inspector-generals, attached to the office of education at Paris. It is the primary inspector who really superintends the instruction of the schools; his labors are unceasing, his inspection is a reality, for he is not required to give notice of his visits. The private primary schools are subject to his inspection, but only as regards the provision made for the bodily health and comfort of the pupils and the maintenance of morality.

The subjects which must be taught in every primary school, in addition to moral and religious teaching, are reading, writing, arithmetic, the elements of French grammar, and the French system of weights and measures; there are other subjects which are facultative—which, in whole or in part, may be taught, that is, if the council of the

commune should so desire, and the departmental council give its consent. These facultative matters are the applications of arithmetic; the elements of history and of geography; the elements of physics and of natural history; elementary instruction in agriculture, the arts, and hygiene; surveying, leveling, drawing, singing, and gymnastics. For girls, there are superior primary schools which teach the facultative matters only; and in girls' schools instruction is usually given in needle-work for about three hours a day.

For the preparation of male teachers, the law requires every department to maintain a normal school; in some cases, however, two departments are allowed to maintain one jointly: there are now 70 of these schools. There are separate normal schools for female teachers; of these, the number was recently 34; now that the law is about to add largely to the number of girls' schools, it will probably be increased. The members of the religious orders devoted to teaching, which perform a great part in primary education, are trained for their duties in the establishments of their respective orders. (Of these orders, the most important is that of the brethren of the Christian schools.) The instruction of the normal schools is meager; it scarcely exceeds the subjects of primary instruction; a considerable proportion of the students, indeed, acquire only an imperfect knowledge of the facultative subjects. School-method is what, in the normal schools, it is deemed most important to teach. The examination for primary school-masters—which is conducted by a commission appointed by the departmental council—is limited to the subjects taught in the schools. There are two classes of certificates, according as the teacher passes in the obligatory subjects only, or in the whole or part of the facultative subjects also. Every male teacher, public or private, is required to have the certificate of capacity granted after an examination; also, excepting in the case of religious persons, a certificate of morality. The law recognizes a certificate of stage, to be granted to assistants who have served as such for three years, as a substitute for the certificate of capacity, but this provision has been unpopular, and the qualification of stage is practically unknown. Female lay teachers require the certificate of capacity; female teachers of the religious orders are exempt from it. No person can be appointed a regular communal teacher unless he be twenty-four years old, and have served for three years since his twenty-first year as an assistant, or as a *supplying* teacher. The supplying teacher gets a lower salary, and may be employed in the poorer communes. The salaries are low even in the towns: in many of the country communes, the legal minima are not exceeded: these are—for an ordinary communal teacher, £24 a year; for a female teacher, or a supplying teacher, £20 a year. The commune pays £8 a year, besides the school-fees; whatever is required to make up the legal minimum, the government supplies; and, since 1862, the government has, upon certain conditions, made slight allowances in addition to the minimum.

It is in secondary instruction that the education of France has a decided superiority over that of England. The primary instruction is scarcely equal to that given in English schools of the same grade. Mr. Matthew Arnold has reported that, in 1859, he found in French primary schools the writing fair, but scarcely so good as in English schools; the reading better, the arithmetic much better, than in English schools. Of history and geography, the pupils were far more ignorant than English school-children of the same age. The ministry of M. Duruy, however, was an era of marked improvement; much more attention is given to the facultative matters now; especial attention to agriculture and the subjects connected with the daily life of the peasant. Mr. Arnold came to the conclusion, that even in the great towns there were no masses of children left altogether uneducated, that almost all passed at some time through the schools. Adult classes, taught in the evenings, have greatly increased in numbers of late years, and are now aided by the state.

In 1834—just after the passing of M. Guizot's law—the number of primary schools, public and private, was 10,316; in 1857 it was 65,100; in 1872 it was 70,180, of which 38,850 were boys' or mixed schools, 17,460 girls' schools, and 11,000 were free schools, In the primary schools alone there were, in 1872, 4,722,000 scholars—3,500,000 more than the number of scholars in 1829. In 1872, the year of the census, a careful inquiry was made into the condition of the French people with regard to primary education. Of the total population above the years of childhood, it was found that 30.77 per cent could neither read nor write, 10.94 could only read, and but 58.29 could do both. There was a most extraordinary difference between one department and another in this respect, the percentage of utterly illiterate persons ranging from 6.9 per cent in Doubs to 61.8 in Haute-Vienne; the most favorable figures indicating universally the north-eastern departments. In 1872 the state and the communes expended 85,000,000 francs on primary education alone. The item of public instruction stood at 137,548,523 f. in the budget of 1885. For the means of higher education in France, see UNIVERSITY OF FRANCE.

State Education in Prussia.

In all the Protestant states of Germany, the school-system in its main features is the same. The Prussian system—more celebrated, more extensive, more practical and thorough than the system of the minor states—always powerfully influencing these, and now likely to influence them more than ever, is that which must be selected for description. About this system, M. Cousin, by a strange confusion between it and a project of law—a mere scheme drawn up by the education minister, Von Altenstein, never even

proposed for legislation—spread misconceptions throughout Europe, which have scarcely yet been dispelled. It has been greatly changed, greatly improved since Cousin wrote in 1831; but it does not yet in symmetry and completeness approach to what he described.

In Prussia, there is a minister of public worship and instruction; but the officials who under him carry on the government of education are the officials of the department of the interior. At the head of the government in each province is a president; over each of the departments into which the province is divided there is a prefect (*bezirk*); each of these officers is assisted by a council, of which one section, called *schulcollgium*, forms a separate council for deliberating upon the local school affairs. One member of the school council, called provincial school-councilor, is associated with the president for administrative purposes: the prefect has attached to him two departmental school-councilors, one Protestant, one Catholic, to advise with him, and to adminster the school-affairs of their respective communions. There is practically a division made of educational affairs between the officials of the province and those of the department. The provincial school-councilor takes the charge of secondary education within the province; the departmental school-councilors the charge of the primary schools of the department.

Over each of the circles into which the department is divided is an office, termed a *landrath*, who reports to the prefect of the departments. With the landrath, in the management of primary schools, is associated the *superintendent*, the church dignitary of the circle. The superintendent is *ex-officio* inspector of the primary schools within the district. The parish clergyman is *ex-officio* local inspector of primary schools within his parish. There is also for the school or schools of each parish a board of managers, the composition of which varies in different provinces. The clergyman is always a member of it: he is usually chairman. In country places, the whole powers of the board are often left in his hands.

In the "exterior" affairs of the school—passing school-accounts, visitation of school-premises, control of the school-estates, adjustment of the school-rate, etc.—the landrath is associated with the superintendent. Its "interior" affairs, all that concerns its teaching and discipline, are subject to the established regulations, under the superintendent's control; but, in practice, they are more under the influence of the departmental school-councilor. The superintendent, however, is required to visit the school, and to watch over the conduct of the local inspector, and he reports annually to the government of the department. The local inspector's province is the interior affairs of the school. He is expected to visit the schools diligently, and to be active in the supervision of them. The religious teaching of the children is almost entirely done by him, it being his duty to prepare them for confirmation, which comes at the end of the school-period. To qualify them for the duty of school-inspection, the candidates of theology are required to attend for six weeks as auditors at a normal school, and to have attended a course of *pädagogik* at the university. Nevertheless, it appears that many clergymen are very ill fitted for this work, and that their powers of interference are often exercised in ways annoying to the master, and detrimental to the school. The "exterior" affairs of the school of a parish belong to the board of managers.

This board is usually composed of representatives (1) of the patrons, if any, of the school; (2) of the parochial clergy; (3) of the municipal body; (4) of the householders. It has a stated meeting once a quarter; it meets whenever it is summoned by the chairman. It manages the revenue and expenditure of the school, in respect of which it is responsible to the landrath; it is the trustee of the school-buildings and property. It is its duty to see that the regular school-hours are kept; that no unauthorized holidays are given; to it application must be made for dispensations for periods exceeding a week. Its members should be present at all examinations and other public solemnities of the school. In the large towns there are school-delegacies appointed by the *magistrat*, whose powers are more extensive, and are in practice the greater, because in the large towns the pastors pay little attention to the schools. The school-delegacies have control over the higher as well as the primary schools which their constituents maintain; two paid members—school-delegates—who must be members of the *magistrat*, exercise the greater part of their authority. Under the delegacy, for every school there is a school-board, consisting of the clergyman and two lay members, whom the delegacy appoints. The delegacy itself is accountable to the magistrat, and both are subordinate to the provincial council.

Every commune is bound to find school-room and teachers for all the children of school age belonging to it. The amount of the teacher's stipend is in every case fixed by the departmental government; there is no legal minimum; the salaries are usually very low. Some parishes possess endowments; but, in general, the cost of maintaining the schools is defrayed by means of (1) school-fees; (2) a local rate; (3) a grant from the national treasury. As children are only expected to pay what they can, and as the state grants aid only after the strictest proof of the incapacity of the commune, the weight of the burden falls upon the local rate. The maintenance of the schools ranks with the first charges upon the local purse. The teacher is appointed by the departmental councilor; in a few towns, however, a certain power of choice is allowed to the municipal authorities—they may select one from a number of candidates presented to them by the government.

School-attendance is by law compulsory for eight years; the school age beginning at the completion of the fifth year. But in most parts of Prussia, children, though allowed, are not compelled to attend till the completion of their sixth year. The school-period

closes with confirmation. A register of all children of school age is made up—usually at the police office; every child is registered for a particular school; there, whatever his rank, he must attend, unless a dispensation be got for him from the landrath. When a dispensation is applied for, the parents must state the motives of the application, and the provision to be made for the child's education. All persons officially connected with schools are expected to use their influence to secure regular attendance; but failing moral suasion, there are other means of enforcing it. The school-master keeps a list of absences, excused and inexcused. When a child's attendance is irregular, the board of managers admonishes its parent. If admonition—which in general is repeatedly resorted to—has no effect, a statement is sent to the police office; the parent is fined a small sum for each day of the child's absence since the last admonition; and the fine can be levied by execution, enforced by imprisonment, or taken out in parish labor. It seems that very few children escape registration; but the regularity of the attendance—in general it is very regular—varies considerably in different districts; the execution of the law being strict or otherwise according to the temper of the people, their circumstances, and the vigilance of the school-authorities. There are no statistics by which the success of the law can be exactly tested. In some of the larger towns the demand for child-labor and the growth of pauperism are adding to the difficulty of enforcing it. Prussia has a factory-law requiring that every child employed in a factory shall attend school for three hours a day, and this law is strictly enforced.

Teachers of every class, public and private, have to pass two examinations. Certificates are of three degrees of merit—they may be marked "very well qualified," "well qualified," or "sufficiently qualified." The heads of examination are "religion, the German language, the art of school-keeping, geography of Prussia, arithmetic and geometry, knowledge of natural objects, writing, drawing, singing, and the theory of music, organ." After the first examination the candidate is eligible as an assistant or provisional master; he must serve in this capacity for three years before taking the second; he must pass the second within five years. The second examination is in the same subjects; but now most weight is given to the art of school-keeping. Of the subjects taught in primary schools the principal is religion; the others are reading, writing, arithmetic, singing, and the elements of drawing. Incidentally, the teacher may communicate information about natural phenomena; about geography, beginning with that of the locality, and the history of Prussia. The teaching was much more ambitious before 1854; before 1854, also, the normal schools, now limited to a meager programme, were universities on a small scale, aiming at the mental training of their students, rather than at fitting them to teach elementary schools. The change is often ascribed, both in Prussia and out of it, to political motives, having been made by a party unfriendly to popular education; but eminent educationists defend and approve it. The schools, they say, are now attempting as much as can be thoroughly done in the time allotted for primary education, and are doing it thoroughly; while the showy teaching of former times, with its endeavor to develop the faculties, and to communicate knowledge, neglected the indispensable elementary instruction, and, as regarded the greater number of the scholars, was in no respect successful. The normal school training, it is said, now fits the teacher for his duties and his position in life; formerly it rather unfitted him for them, while fitting him perhaps for something better. It is, however, admittedly a defect in the Prussian system that it offers to the humbler classes no opportunity of carrying their education beyond the point at which the elementary schools leave it. In some of the towns there are improvement institutes, where young persons are taught in the evenings or on Sundays; but they attempt little, are badly organized, and are neglected by the school administrations. It should be stated that the town schools often teach somewhat more than is taught in country places—more geography, history, and natural knowledge—but this, though permitted, is not encourged by the authorities. Grammar is entirely excluded from primary instruction. The only part of the teaching which is less than excellent is the writing: it has been stated that upwards of 50 per cent of the recruits are unable to write—the art, never perfectly mastered, being lost, it must be supposed, through want of practice.

As regards religious instruction, the rule is that the primary school is denominational—public schools are set apart, that is, for children of each of the religious bodies; the clergyman who has the charge of the school is the clergyman of the body to which it is appropriated. Besides the "evangelical establishment," in which Lutherans and Calvinists are combined, there are the Roman Catholics and the Jews to be provided for; of other sectaries, there are not 10,000 in all Prussia. The Lutherans and Cavinists are combined in the school as in the church. Dissenters are allowed to withdraw their children from the religious instruction, and have it given by their own pastor. Any commune may establish a mixed school, if it so desire, and if the authorities permit; but, in practice, mixed schools are only to be found where it would be very inconvenient to establish a school for each body. In mixed schools the teacher are chosen proportionately from each of the two great religious bodies; if there be only one teacher, it is, in some districts at least, customary that he should be alternately a Protestant and a Catholic. The experiment of mixed schools had a long trial in Prussia, and was found to be unsatisfactory, leading to attempts, or suspected attempts, at proselytism, and to parish squabbling. It has been abandoned, not so much from the wish of the government, as

in deference to the feelings of the people, and to the demands of the Roman Catholic hierarchy. But the denominational system is more in accord with the part which the state assigns to religion in the school. The school, it is said, should be the organ of the church for training children to church-membership; school and church are expected between them to form the child into a man contented with his position in life. Religious teaching must be given by the master for an hour every day. In the Protestant schools the master teaches the Lutheran catechism to Lutheran children; the Heidelberg catechism to the Reformed children. Scripture history is also taught; and hymns, from a prescribed collection, have to be committed to memory. The master is not allowed to expound the catechism; his duty is to see that the children learn it and understand the words in which it is expressed. It is the clergyman who explains its doctrines to the elder children in preparing them for confirmation.

Any one may open a private school of any class in Prussia who can obtain a license for the purpose from the government; but in a city it must be shown that the district in which the school is to be placed is insufficiently supplied with schools; and every private teacher must have passed the two examinations. Private schools are subject at all times to the inspection of the school-councilor, and are bound strictly to follow the regulations established for private schools. The larger towns in Prussia are not yet adequately supplied with public primary schools; private primary schools are therefore common in such places: in Berlin they educate nearly half the children who are in primary schools.

Of the secondary and higher education in Prussia, a brief and general notice must suffice. It has already been stated that the superintendence of the secondary schools is undertaken by the school-councilor of the province; it is independent of ecclesiastical control. The larger communes and the towns are required to maintain middle schools, giving instruction of a higher order than is given in the elementary schools, a sound German education, and preparing boys for the gymnasia. These must be provided to the satisfaction of the authorities, according to the wants of the population. They are maintained, like the primary schools, by school-fees, local taxation, and these failing, the state treasury. Some of the larger towns maintain also secondary schools of a higher class; these are of two kinds—the real-school, and the gymnasium or grammar-school. In such towns, as stated already, the local management rests with the school-delegacy. There is, besides, a considerable number of real-schools and gymnasia which are entirely in the hands of the government. None of the real-schools take boarders; very few of the gymnasia do so. The gymnasium is a classical school preparing for the universities. In the real-school, mathematics, scientific studies, and modern languages are substituted for the classics, and the instruction is designed to prepare the pupils, as far as possible, for the pursuits of life. The real schools grant certificates to their pupils. The royal real-schools and the gymnasia (other than those maintained by the large towns) are under the management of the provincial school-councilor. Some of the older of those gymnasia have endowments, but the money necessary for their support is contributed by the state. Appointments to the schools are made by the school-councilor; he appoints the teachers, or nominates the leet out of which local authorities have to choose, in all the secondary schools. Teachers for all the schools have to pass two examinations. There are boards of examiners, appointed by the provincial government, which conduct the examinations; these boards also examine the students of the gymnasia, to test their fitness for the university. The university in Prussia is a teaching (or rather a lecturing), as well as an examining body, and grants degrees in four faculties—theology, jurisprudence, medicine, and philosophy. There are seven universities within the territory held by Prussia before the war of 1866; in two of these—Breslau and Bonn—there is a Roman Catholic as well as a Protestant institute of theology. The university affairs are administered by a commissioner appointed by the crown; all their regulations are prescribed, and all the appointments in them made by the state.

State Education in the United States.

In the United States, the education of the people is out of the sphere of the central government; it ranks among the domestic affairs of the several states, and it is chiefly in the northern states—those from which, before the late war, slavery was excluded—that systematic attempts have been made to promote it. The central government has, however, in more than one instance endeavored to assist education in the states, by providing for it endowments. In the states which contain waste lands, it puts aside, in every newly-surveyed township of six miles square, one sq.m, for the support of schools within the township. The state becomes trustee of this land, or of the price obtained for it, which is usually called the township-fund, and pays over the yearly income to the township when it has been settled. The central government, about 1836, had accumulated in its treasury a considerable balance, the surplus of its income over its expenditure during several years: this it apportioned *pro ratâ* among the states, reserving the right to reclaim it. This right has not been, and is not likely to be exercised; and in most of the Northern states, the income of the "United States deposit-fund" is applied to the support of education. Since 1864, by what is called the "agricultural college act," the central government has made a liberal offer of allotments of land to the states upon certain conditions, for the endowment of one or more institutions in every state, in which—whatever the other instruction may be—special attention shall be given to those

branches of learning related to agriculture and the mechanic arts. Several states are preparing to avail themselves of this offer.

Every one of the northern states has its common schools. Before the war, Kentucky, Missouri, and Louisiana had each some kind of school-system; at various points throughout the south, particular towns had established schools, always after the model set in the northern states. The new state of Western Virginia has passed a school law since the conclusion of the war. In the northern states, besides the endowments above described—both of which are possessed by most of the states—every state possesses a school-fund arising from various sources—sale of lands, taxation, penalties, and forfeitures—which is usually vested either in the state legislature or in a board of education. In one or two of the states, the income of this fund is considerable, but in general it is small. It is usually, but not in all the states, applied solely to the support of public schools, or of the normal schools which help to provide them with teachers. Apart from the influence exercised by means of this fund, the state usually promotes public instruction only by its legislation, by which it requires or enables local bodies to make certain provision for the education of children within their jurisdiction. Everywhere, the law leaves much, and usually the practice leaves everything, to the local bodies; and these come short of, or exceed the legal requirements according to the local interest in education and ability to pay for it. It is through the interest of the municipalities in education that very ample provision is made in the towns; it is through the force of example, and in deference to educational experience, that a certain uniformity of system prevails. There is a close approach to uniformity both in the law and in the practice of the several states; and a description of the system of one state will be approximately true of that of other states. The Massachusetts system is fittest to be selected for description, as being the oldest, the most celebrated, that which on our side of the Atlantic is most identified with the common schools, and perhaps on the whole the most successful. Some of the principal variations from it will be noted.

In 1642—20 years after the landing of the *Mayflower*—the Massachusetts colonists passed a law requiring every citizen, under a penalty of 20s., to teach his children and apprentices, or have them taught, to read perfectly the English language. Five years later, they passed another law, requiring, under penalty, every township containing 50 householders to support a teacher to teach their children to read and write; requiring every township containing 100 householders to maintain a grammar school capable of fitting youths for the university. The present law is different, if not less liberally conceived. The change was made by numerous steps, and was probably forced on by the circumstances of the community. The law, as it now stands in the revised statutes of the state, provides that in every township the inhabitants shall maintain for at least six months in the year a sufficient number of schools for all the children of the township. The teachers are to be of competent ability and of good morals, and they are to teach orthography, reading, writing, English grammar, geography, arithmetic, the history of the United States, and good behavior. Other subjects—algebra, vocal music, drawing, physiology, and hygiene—are to be taught or not at the discretion of the local committee. Every township may, and every township containing 500 householders must, also maintain for ten months in the year a school which shall give instruction in general history, bookkeeping, surveying, geometry, natural philosophy, chemistry, botany, the civil polity of Massachusetts and of the United States, and the Latin language. And in every township containing 4,000 inhabitants, the teacher must be competent to instruct in the Greek and French languages, in astronomy, geology, rhetoric, logic, intellectual and moral sciences, and political economy. Moreover, any township may establish schools for children over 15 years of age, determining the instruction to be given, and appropriate money for their support. The compulsory part of the law is supported by penalties, but it is said that there would be difficulty in enforcing them; at any rate, they are not enforced. It is also provided that every child between 8 and 14 must be sent to school for at least 12 weeks in a year: the penalty for breach of this provision is $20, but the idea of enforcing it seems never to have been entertained; its existence even is not generally known. The law does not permit school fees, or, as they are called in America, rate-bills. There seems to be no fund arising from waste lands in Massachusetts; and the township raises the necessary funds by a tax upon property—the personal property of the inhabitants and the capitalized value of their real property situated within the township. The amount of the rate is by the law left wholly undetermined: it is determined by the householders at their annual meeting. The state endeavors to influence the townships to make a liberal provision by means of the school fund, a share of which is given to every township which has made its returns to the board of education, and has spent not less than at the rate of $1\frac{1}{2}$ per head for all the children of the township. The school-fund contribution is very small—less than 25 cents for every child; but it is said to have an excellent influence upon the rural townships. No doubt, the publication of the returns made to the board of education tends to spur on the backward districts.

The management and control of all the public schools of a township are placed in the hands of a school-committee, consisting of any number divisible by three; the members of this committee hold office for three years, and one-third of them are elected annually at the annual meeting of the township. The committee have the supervision of the schools; and it is among their duties to see that no book calculated to favor the tenets of

any particular sect of Christians shall be used in the schools, and to require the daily reading of some portion of the Bible in the common English version. Any township by its public meeting, or a city by its city-council, may require the committee to appoint a paid superintendent of schools: when this is not done, the members of the committee receive a small allowance for the time during which they are engaged upon the school-affairs. But, moreover, any township may, at a meeting called for the purpose, resolve to divide itself into districts for the support of its schools. If this be done, the township names for each district a "prudential committee," consisting either of one or of three persons, resident within the district, which is charged with providing and keeping in repair the school-house, at the expense of the district, and, if the township so determines, with the duty of selecting and contracting with the teachers. The district determines the amount to be raised by it for the building or repair or furnishing of its school; this is collected by the township collector, and handed over to the district-committee. The school-committee retains its functions of management, except so far as they have been made over to the districts; and hence, there is a double management of the schools, which is found to be attended with inconveniences. The division into districts, too, is said to have led to an unnecessary multiplication of schools in country places: people scheme to have the township so divided that there may be a school in their neighborhood—there are, therefore, more schools than are needed, and more than can be maintained in efficiency. The school-committee—in cities, the school-superintendent—examines the teacher before his appointment, and grants him a certificate, which remains in force for a certain time. There are three classes of certificate—one valid for six months, another for twelve, a third for two years. The common schools of a township are open to all children resident therein between five and fifteen years of age: none are to be excluded on account of race, color, or religious opinions; and it has been held that a child unlawfully excluded may recover damages therefor in an action of tort.

In New York, in Pennsylvania, and in most of the western states, large municipal powers are possessed by the county, and the county shares with the township the management of school-affairs. New York has a state superintendent, whose power over the schools is considerable. In that state, it is the school-commissioner of the "assembly district" in which the township lies who divides the township into school-districts; and it is the district which determines the school-tax: the township is almost completely ignored. In New York, Ohio, and Illinois, it is by county officials that teachers are examined and certificated. In New York, Rhode Island, and Connecticut, "rate-bills"—that is, school-fees—are allowed, and are usually levied. Several states besides Massachusetts make school-attendance compulsory: in most of the states, there appears to be some provision against "truancy;" but it appears that attempts are not made to enforce the law except occasionally, in the case of homeless, wandering children, who are liable, in lieu of a fine, to be sent to reformatory schools. It has been calculated that in the city of New York (pop. 1,200,000) there are about 167,000 children who do not go to school—though in no city is there a better or ampler provision of common schools.

As might be expected, the school-laws work badly in country districts. The householders are disposed to be satisfied with any kind of school, provided it be cheap, and within easy reach of them; and the multiplication of schools by the district-system, makes it almost unavoidable that an insufficient sum should be spent upon each school. The teachers—a vast majority of whom are women—being wretchedly paid, are badly qualified; they are constantly changing; scarcely any intend to make teaching their occupation for life. Few of them have been trained for their work—the normal schools which exist being utterly inadequate to supply the demand for teachers; and the examination by a rural school-committee affords but a slender guarantee of competency. The teacher is usually "boarded round" among the farmers of the district, and is said to be treated by them with much observance; but his income—putting a money-value upon the board—has been estimated at an average of about 50s. a month, and that only during the time that the school is open. In 1864, in 84 townships of Massachusetts—more than a fourth of all the townships in the state—the schools were kept open for less than the statutory period of six months. The teaching is said to be wonderfully good, considering the scanty pay given; but where the vacations last for more than six months, and the teacher is changed almost every term, thorough and systematic instruction is scarcely possible. It is in the towns that the working of the school-law has been creditable and successful. Through the high public spirit of the municipal bodies, and the great importance attached to education, the support of the common schools is in general most liberally provided for.

In the towns, there is usually a superintendent of schools, by whom, under and in co-operation with the general and district school-committees, the schools are inspected, and the character of the instruction determined; by him the examination of the teachers also is conducted. Of the schools, there are four classes—primary, intermediate, grammar, and high-schools or academies. Children usually enter the primary school about 5 or 6; the grammar-school between 8 and 9; the high-school between 12 and 13 years of age. They are not promoted from one class of school to another without undergoing an examination; the intermediate schools, where they exist, are intended for those who are too old to be at the primary school, and too backward to enter the grammar-school. To be admitted to a grammar-school, a child must be able to read at first sight easy prose, to spell

common words of not more than three syllables, and to have acquired a slight knowledge of arithmetic. For admission to the high-school, the usual requirements are ability to read correctly and fluently, an acquaintance with the simple rules of arithmetic, and some knowledge of geography and grammar. From these tests may be inferred the average proficiency expected to be attained by children leaving the primary and the grammar-school respectively. In the grammar-schools of Boston, the programme of studies consists of spelling, reading, writing, arithmetic with book-keeping, geography, English grammar, the history of the United States, natural philosophy, drawing, and vocal music: this is nearly the usual programme; but in New York and one or two other states a little more is attempted. Between the high-schools or academies in the various states, there are considerable differences. In the city of New York, for example, the Free academy has pretensions to the rank of a university, and grants degrees in arts and science (bachelor of arts, bachelor of science, master of arts) to students who have completed with credit the curriculum of five years. But, in general, the high-schools are schools of secondary instruction, intended to prepare youths for the university—instruction being given in the classical languages, mathematics, the sciences, history, and the English language and English literature. The usual curriculum is one of four years; and the students are not required to study all the subjects taught in the school. At Boston, where boys are admissible to the Latin high-school at 10 years of age, the curriculum lasts for six years. There are high-schools for girls as well as for boys, the programme of instruction being the same in both. At Boston, the curriculum at the girls' high-school lasts for three years; and pupils at admission must be between 15 and 19 years of age. Boston possesses, besides its Latin high-school and its girls' high-school, an English high-school, said to be admirably planned and conducted. The instruction in it closely resembles that given in the real-schools of Germany, including French and German, and various sciences, with their application; being intended to enable boys to complete a sound English education, and to prepare themselves for commercial life. Great complaints are almost everywhere made– Boston seems to be exceptional in this respect—of the irregularity of the attendance at the primary schools. It is estimated that in most states not much more than half of the children pass from these to the grammar-schools; but a trifling proportion of the grammar-school pupils enter the high-schools, and of these, only a small fraction persist to the end of the curriculum. All high-schools grant certificates of graduation to pupils who have creditably gone through the course of study. The study of the classics does not, even in the most pretentious institutions of this class, seem to be carried very far, much more attention being given to mathematics and natural science. In Boston—in many respects the most favorable example that could be taken—there were, in 1880, 61,056 children of school-age—between 5 and 15 ; of these, 60,000 were in school, the average attendance being 46,902. The number enrolled at the eleven high schools '82, was 2389 ; at 22 private academic schools, 5107. The number of students who complete the five years' curriculum of the New York Free academy seldom exceeds fifty. Among the wealthy, there is said to be a growing disinclination to make use of the common-schools: their children are usually sent to private academies. The only serious opposition to the non-religious character of the common schools comes from the Roman Catholic clergy; but it is stated that there is a growing feeling upon this subject among some of the other religious bodies. In many of the New York schools, in which the majority of the children are Roman Catholic, clerical influence, insufficient to impress upon the education the religious character which it would approve, has obtained, with the tacit assent of the school-authorities, the disuse of the daily Bible reading which the law prescribes.

The primary and grammar schools are most frequently mixed schools—that is, they admit boys and girls; in the teaching, however, the sexes are kept apart. The teachers in primary and grammar schools, even in the towns, are usually women; but in Boston the principal of a grammar-school is always of the other sex. The schools are in towns always *graded*—divided, that is, into classes composed of those who are at the same stage; each grade forms a separate department of the school, and is taught by a separate master. The usual number of pupils allotted to a teacher is in the primary schools about 50; in the grammar-schools about 35. This system of grading is a cheap system, because it enables a teacher to take charge of a large number of pupils; but it is said to lead to a want of thoroughness in the instruction, the teaching being addressed to the class rather than to the individual members of it. Want of thoroughness seems, indeed, the besetting sin of American teaching, which aims too much at communicating knowledge, not sufficiently at developing capacities. In the primary and grammar schools, the education costs from 25s. to 30s. per head; in the high-schools, from £6 to £10 per head.

Statistics of National Education.

The proportion of children attending school—i. e., enrolled in school-registers—to the whole population of the countries under-mentioned may be approximately stated as follows: England, 1 in 7.7; Scotland, 1 in 6.5; Prussia, 1 in 6.27; France, 1 in 9; Holland, 1 in 8.11; Belguim, 1 in 11; northern states of the American union, 1 in 4.5; Switzerland, 1 in 7; the minor Protestant states of Germany, 1 in 6.7. These figures, however, must not be taken as indicating the comparative diffusion of education in the

countries named: nor are they to be relied on as indicating, with anything like exactness, the comparative proportions of children actually attending school; for the proportion of the children enrolled which on the average is in actual attendance, varies in different countries. It should also be borne in mind that averages conceal the condition of the worst parts of a country—in Scotland, for instance, where the school attendance varies from 1 in 4 of the population in the best districts to 1 in 15, 1 in 20, and even 1 in 30 in the worst.

See the reports of the assistant-commissioners appointed to inquire into the state of popular education in England, vol. iv., being vol. xxi. part iv. sess. 1861; the second report of the Scottish educational commissioners, 1867; the statistical society's quarterly journal for March, 1867; Horace Mann on education in European countries; Fraser's report on American (U. S. and Canada) schools; Cousin on German and Dutch education; M. Block's abstract of public documents relating to education in France; *L'Instruction du Peuple*, par Pierre Tempels (Brussels, 1865); *Statistiche Nachrichten über das Elementar Schulwesen*, an official return, which gives a complete survey of elementary education in Prussia to the end of 1864; *Conrgés International de Bienfaisance de Londres, Session de* 1862; and *Rapport et Discussion sur l'Instruction Obligatoire.* See EDUCATION.

[Since the preceding account was written, the claims of national education have been more fully recognized, and, with less opposition than might have been expected, a national system has been established in England and Scotland. The elementary education act for England, 1870, enacts that every district in which the existing schools are found deficient shall have a popularly elected school-board, to manage its rate-supported schools, levy school rates, appoint teachers, etc. Elementary schools are to be supported, and the expenses of school boards paid, out of funds called school-funds. The local rate forms the nucleus of each school-fund; but every school under the act is likewise entitled to an annual grant from parliament not exceeding the income of the school from other sources, and varying in amount according to the number of pupils and their proficency as tested by different standards of examination. Schools are to be open at all times to government inspection. Religious instruction, if given at all—and this is left to each board to decide—is to be given at fixed times other than the ordinary school-hours, when no child is compelled to attend. It is further left to the discretion of school-boards to make education compulsory—The Scotch education act, 1872, differs materially from the English act on three points only; first, by providing that a school-board, under the Scotch education department, is to be elected in *every* parish and burgh; secondly, by making it illegal for parents to omit educating their children between 5 and 13 in reading, writing, and arithmetic; and thirdly, by comprehending higher-class schools. Otherwise the acts are much alike. Every school is to be open to children of all denominations, and religious instruction is only to be given before or after ordinary school-hours. Provided they conform to the "conscience clause," school-boards may make any provision they please for religious instruction. School-boards are enjoined to relieve the teachers of higher-class schools, so far as may be, from elementary work.]

NATIONAL EDUCATION (*ante*). See COMMON SCHOOLS: ENDOWED SCHOOLS ACTS.

NATIONAL GUARD, an organization for local defense, differing from the British militia and volunteers, in being at the disposal of the municipalities, not of the crown. Italy, Greece, and other nations have maintained this civic force; but the country whence it derives historic fame is France. The French national guard was instituted in Paris in 1789, when the government had an army of 30,000 at the gates. The municipality armed 48,000 men, and their example was followed by the chief towns of France. These corps obtained the name of national guard and assumed the famous tricolor as their ensign. In 1795, 30,000 of the Paris national guards attacked the Tuileries, and were repulsed by Napoleon Bonaparte with 6,000 regular troops. In 1830 they were reorganized under the command of Lafayette, their original chief; and between 1848 and 1851 a law was passed by which all males above 20 not otherwise employed under government were included in the national guard. After the *coup d'état* in December, 1851, they were reduced to the condition of an armed police. In the war of 1870–71 they showed some signs of vitality in sympathy with the commune, but effected nothing for France. After the fall of the commune they were disbanded.

NATIONAL GUARD (*ante*), a body of militia composed principally of the bourgeoisie, first formed by the committee of safety in 1789, and mustering at one time 300,000 men under the command of Lafayette. Napoleon dissolved them in 1795, and reorganized them in 1814. They were again dissolved in 1827, by Charles X., were reorganized in 1830, deserted Louis Philippe in 1848, were reorganized in 1852, and took part in the Franco-Prussian war and the insurrection of the commune.—The same term is applied to the state militia of New York and New Jersey.

NATIONAL HYMNS are popular airs which are peculiar to and characteristic of a particular nation. It is a singular fact that the composers of national hymns are seldom known. The Germans call their national music *volk's musik*, a designation which is very appropriate, as a people collectively may not improperly be considered as the actual composer of its national tunes. A short melody extemporized by some one in a moment of patriotic emotion, is often taken up by others and traditionally preserved. In the course of time it generally undergoes modifications, until it has attained those conditions

which insure it a general acceptance. This fully explains what W. Grimm means in his laconic saying, "A national song composes itself" (*Ein Volkslied dichtet sich selbst*), for the attempts of celebrated musicians to invest a tune with universal and permanent popularity have been successful in a few instances only. Among the most popular European national hymns, is *God save the King*, but the authorship of the tune has not hitherto been satisfactorily ascertained. In Prussia it is called *Heil Dir im Sieger Kranz*, and in the United States the melody is sung with the words "*My country 'tis of thee*," etc. Although there is no satisfactory evidence of its having been in existence before the reign of George II., there are several tunes known of an earlier date in some degree resembling it. Dr. Bull's tune, discovered in an old manuscript dated 1619, certainly bears a remarkable resemblance to the present *God save the Queen*, but with none of these melodies have the words *God save the King*, or similar words, been found. The Austrian national hymn, *Gott irhatte* [*Franz*] *den Kaiser*, is a composition by Joseph Haydn. Having during his visit to England witnessed the effect of *God save the King*, on public occasions, Haydn resolved after his return to Vienna, to present his country with a similar composition. Baron Swicten and count Saurau procured the poetry for him, and the hymn was sung for the first time on the birthday of the emperor Franz, Feb. 12, 1797. The poetry was written by L. Leopold Haschka. The Russian hymn dates from the year 1830, when the emperor Nicholas ordered it to be performed in concerts and representations on the stage. Its composer was Alexis Lwoff, and the air appears to have been suggested by the *Sicilian Mariner's Hymn*, which is also a favorite melody of the gondoliers in Venice. The poetry of the patriotic song of the Danes, *Kong Christian stod ved pöien Mast*, was written by Ewald, and the music is by a German composer, Johann Hartmann. The French national hymn, the *Marseillaise*, dates from the year 1792. It was composed by Rouget de l'Isle during the French revolution. The national hymn of the Germans, *Die Wacht am Rhein*, came into great popularity during the Franco-German war of 1870. *Was ist des Deutschen Vaterland* was written by Ernst Moritz Arndt, a German patriot, during the wars of Napoleon I. There have been many attempts to manufacture national songs in the United States, but the great national hymn of America will probably be a spontaneous production. The *Star-Spangled Banner* was written by F. S. Key, in 1814, and the words were adapted by F. Durang to an old French air, long known in England as *Anacreon in Heaven*, and in America as *Adams and Liberty*. It grew in favor in the loyal states during the rebellion, and was played continually by all military and orchestral bands. But as a patriotic song for the people at large it is almost useless, as the range of the air, an octave and a half, places it out of the compass of ordinary voices. *Yankee Doodle* has the claim of long association, and will probably always retain a certain degree of favor. Its words are mere childish burlesque, and it is reported to have been a popular tune in England during the commonwealth. Some state that its doggerel words originated at that time, Oliver Cromwell being designated as Nankee Doodle. Others state that it was the tune originally set to the old English song *Lydia Locket lost her Pocket*, and that the present words were written by a British sergeant in Boston in 1775. *Hail Columbia* was written by Joseph Hopkinson in 1798, and was set to the music of the *President's march*, which was composed by one Phylas or Fayles, a German leader of orchestra in New York. *Columbia the Gem of the Ocean*, and Harrison Millard's *Viva l'America* have also attained considerable popularity.

NATIONAL PARKS, a term applied to certain territory in the United States, set aside by act of congress and specifically exempted from sale, being reserved, by reason of picturesque character and general natural features, as common to the entire people; except for settlement or private use. Up to the present time (1881) two tracts of land have thus been appropriated—the Yosemite valley and the Yellowstone region; the former of which was made a national park by act of congress passed June 30, 1864, and ordered to include the Mariposa Big Tree grove: the Yellowstone park was set aside by act approved Mar. 1, 1872.—The wonders of the Yellowstone region were first made known to the world through the report of a government reconnoisance, or exploration of the Yellowstone river and the surrounding country, made by officers of the U. S. corps of engineers, under the orders of lieut.gen. Sheridan, in 1871. This region, long known as the "Great Divide," is comprised in the territories of Montana and Wyoming, being the geographical center of North America. The area covered by the reservation measures 3,578 sq. miles. Generally speaking, it lies between 100° and 110° w. long. and in 44° or 45° n. lat., the general elevation being about 6,000 ft. above the level of the sea, though mountain ranges on every side rise to a height of 10,000 to 12,000 feet. Four routes lead to the Yellowstone national park: 1, From Corinne, on the Central Pacific railroad, to fort Ellis, thence 30 m. to the Yellowstone river; 2, by way of the upper Missouri; 3, from the Canadas and the great lakes to Duluth, and thence by the Northern Pacific railroad; and, 4, from Walla-Walla, on the west. The most convenient and practicable route has hitherto been that from Corinne to Virginia City, Montana; thence to fort Ellis, crossing the Madison river, one of the head-waters of the Missouri; and to the Gallatin valley, which is about 40 m. in length and 10 to 15 broad, the finest agricultural land in Montana; at the upper end of which is Bozeman, and 3 m. beyond, fort Ellis. From this point the trail leads to a Crow agency, about 30 m. dis-

tant; and thence by a course nearly due s., following that of the Yellowstone river, to the great falls of the Yellowstone. The whole of this route, after reaching the river, offers some of the most impressive and sublime scenery in the world. Picturesque masses of rock, tall columns of basalt, and a landscape generally volcanic in character, present the most prominent features of the trail; chief among which is the "Devil's Slide," an extraordinary vertical rock formation, projecting a thousand feet into the air. Proceeding up the valley, Gardner's river, or Warm Stream creek, is met, as it enters the valley and joins the Yellowstone 15 m. from the middle cañon. Here begins the hot springs district, with the largest spring in the country, consisting of a basin 40 ft. long by 25 wide, through three openings, in which great quantities of carbonic acid gas are discharged. In this spring, which offers water of different degrees of temperature, in smaller basins and terraces, are found the most fantastic deposits of stalactites and stalagmites; while the basins are gracefully curved and scalloped, and vary in color from a rich yellow to a vivid red, offering a most brilliant and beautiful effect. Leaving this point, the "low divide" is crossed between the valley of Gardner's river and that of the Yellowstone, and the precipitous entrance to the great cañon is reached, so gloomy and forbidding in aspect that it is named the "Devil's Den." Through this narrow gorge the river rushes with great velocity, until it shoots over the abrupt descent of a fall of about 150 ft., and, after a series of rapids and cascades, finally leaves the great cañon with a single leap of 350 ft., after which its course lies over a rolling prairie for several miles. The great cañon has never been explored, but the height of its sides is known to be more than 2,000 feet. A new hot spring region is now reached, remarkable for its "mud geysers," and particularly for a mud volcano, having a crater 25 ft. in width and 30 ft. in depth, and in a constant state of ebullition. One of the geysers having a basin 60 ft. in diameter, spouts at regular intervals of six hours. Eight m. from these geysers is Yellowstone lake, more than 7,000 ft. above the sea-level, 30 m. in length, 15 m. broad, and from 1½ to 50 fathoms deep, with a shore line measuring more than 300 miles. Almost in contact with this remarkable body of water is a chain of hot springs; fish abound in the lake, game of all kinds is found in the surrounding forests, and there are facilities for boating, and rude accommodations for the tourist. Striking westward, the traveler now journeys toward the head-waters of the Madison river. The country, though impressed with volcanic characteristics, is here diversified by dense tracts of forest; and about 10 m. from the Yellowstone a new system of hot springs is reached, the whole district presenting the appearance of a vast limekiln in active combustion. Shortly after reaching the crest of the divide between the Yellowstone and the Madison, a valley is entered in which the springs are strongly impregnated with sulphur. In what is known as the Firehole valley—that of the Firehole river, the main eastern fork of the Madison—are large numbers of beautiful springs. But the object of greatest interest to the tourist is the great geyser basin, which is entered from the north, following the course of the Madison river. The geysers are all named, the first seen being two which are very active, placed one on each side of the river, and known as the "Sentinels." Next is the "Well" geyser, which has a crater formed like a well, and which spouts to a height of 80 or 90 feet. An extraordinary formation, 8 ft. high and 90 in circumference, is called the "Grotto;" it is hollowed into arches, and plays to the height of 60 ft. several times in every 24 hours. The "Giant" geyser is considered one of the most remarkable in the group. It has a crater 5 ft. in diameter, and its highest point is 15 ft. above the mound on which it stands. It throws a column of water the size of the opening, to the measured height of 130 ft. continuing each active period for an hour and a half. From this system of geysers, a journey of about 12 m. reaches "Castle" geyser, which is situated on a platform of deposit, measuring 100 ft. in length and 70 in breadth. From the center of this platform rises a chimney 12 ft. high, 120 ft. in diameter at the base, and 60 ft. at the top, with a three-foot aperture. This monster geyser, when in operation, sends a column of water to a height of 250 ft., the movement being not continuous, but pulsating, at the rate of about 70 throbs to the minute, the time of activity being about an hour. At the head of the valley stands the geyser known as "Old Faithful," so called because it plays with great regularity every three-quarters of an hour, throwing a stream 100 to 150 ft. in height. From the mound of this geyser can be seen the best presentment of the basin. The entire valley is drained of its hot water by the Firehole river, which takes it into the Madison. The geysers visible from this point are severally named the "Bee-hive," the "Giantess," "Grand," "Young Faithful," "Fan," "Riverside," "Saw-mill," "Turban," etc. The Firehole river is itself one of the most remarkable features of this region. Its bed and banks, entirely composed of hot-spring deposit, are honeycombed and scooped out by geyser springs and pools, varying between minute vents not bigger than a quill and great tanks of boiling water. The course of the river is very straight, and resembles that of a canal through a country of limekilns covered with slag-heaps and refuse of old smelting-works. The borders of this stream, and of its confluent, Iron Spring creek, are dotted in all directions with mud ponds, warm pools, boiling springs, and the remains of ancient geysers. The Yellowstone region has been only visited by tourists, and the therapeutic qualities of its springs have not been analyzed. The writer of the government report said of the country in question: "No other locality, I think, can be found which combines so many attractions, both of climate and scenery." The act of congress by which the Yellowstone

country was reserved as a national park, stated that it was "reserved and withdrawn from settlement, occupancy, or sale, under the laws of the United States, and dedicated and set apart as a public park or pleasuring ground, for the benefit and enjoyment of the people;" while by the same act it was placed under the exclusive control of the secretary of the interior. The park is 65 m. n. and s. by 55 m. e. and west. During the summer months the atmosphere is pure and invigorating, with an entire absence of storms. The number of springs is from 5,000 to 10,000, and there are at least 50 geysers. The temperature of the springs ranges between 160° and 200°.

The Yosemite valley was granted by congress to the state of California, conditionally on the district being forever set aside as a place of public resort and recreation. It is in Mariposa co., California, about 155 m. from San Francisco, nearly in the center of the state. It is nearly level, and is 6 m. long, and varying between one-half a mile and a mile in width; and its perpendicular depth below the surrounding level is about one mile, although it is elevated above the sea level almost 4,000 feet. Its walls are nearly vertical, and through it winds the Merced river, its general direction being n.e. by e., and s.w. by w., nearly at right angles with the general direction of the mountain ranges. The valley is accessible by stage and saddle-horse from points on the Central Pacific railroad, about 90 m. distant, but only in summer: in winter it can only be reached on snow-shoes. There are hotels for the accommodation of tourists, and these are comfortable and well supplied. Numerous objects of interest occur in proceeding up the valley, the first being the Bridal Veil fall, which is formed by the precipitous leap of a creek of the same name over a descent of 630 ft., to a slope below, from which point a series of cascades extend to the valley, the entire fall being more than 900 feet. Cathedral rock, a massive granite formation, 2,660 ft. in height, is met a little above the fall; and a short distance beyond this, the "Spires," single columns of granite, 500 ft. in height, stand out from the main walls of the valley. Sentinel rock is 3,043 ft. high, its termination being a slender obelisk 1000 ft. in height. Sentinel dome and the Virgin's Tears fall are the next important features; the latter being a cataract falling more than 1000 feet. El Capitan and the Three Brothers are monster masses of rock; and, above the latter, is the great Yosemite fall, which has first a vertical descent of 1500 ft., then a series of cascades falling 626 ft., and a final plunge of 400 ft.—the whole appearing to the observer to be a continuous fall, whose effect is grand and imposing in the extreme. During Aug. and Sept. the Yosemite and Bridal Veil falls nearly disappear, the best time for seeing them being in May, June, or July, before the creeks which form them are dried up. Other smaller falls and innumerable eccentricities of the rocky walls of the valley occur at different points; while the general effect is a combination of the sublime and beautiful in nature, not known to exist elsewhere to a similar extent.

About 16 m. s. of the Yosemite valley are the Mariposa groves of "big trees," one of a number of groups or collections of the *sequoia gigantea*, only found in California; and the *sequioia semper virens*, or red wood. Three of these groves are in Mariposa co., and include 134 trees more than 15 ft. in diameter, and 300 of smaller size. In all the groups there are trees from 275 to 375 ft. in height, and 25 to 35 ft. in diameter, well proportioned; the age of some that have been cut down have been estimated, by the usual methods, at from 2,000 to 2,500 years. The Yosemite valley was unknown to white men until 1851, and was first visited by tourists four years later.

NATIVE, a term mostly applied to metals, and employed to designate substances, as minerals, which are most of them more abundantly obtained from other minerals by chemical processes. Thus silver found pure, or nearly so, is called *native silver*, whilst most of the siver in use is procured from ores in which it exists variously combined.

NA'TROLITE, soda mesotype, feather zeolite, *spreustein*, radiolite, Bergmannite, a hydrous silicate of the zeolite section, containing silica, soda, and alumina, with about nine per cent of water, and usually oxide of iron, crystallizes in the trimetric system; crystals usually slender and interlacing, divergent, or stellate; also fibrous and massive. Hardness 5 to 5.5; sp. gravity 2.17 to 2.24. Luster vitreous, sometimes pearly: color white, grayish, and yellowish; transparent, translucent. The following is an analysis of crystals from Auvergne; silica 47.76; alumina 25.88; soda 16.21; water 9.31. The following were the constituents of iron natrolite: silica 46.54; alumina 18.94; peroxide of iron 7.49; soda 14.04; water 9.37; iron 2.40; manganese 0.55. In North America natrolite occurs in Nova Scotia in trap rock; at Cheshire, Conn; at Copper falls, lake Superior, in crystals associated with native copper. Natrolite is also found at Bergen hill, N. J.

NA'TRON, or TRONA, an impure sesquicarbonate of soda ($2NaO.HO,3CO_2 + 3Aq$), which always contains sulphate of soda and chloride of sodium. It is obtained from the margins of lakes in Egypt, Siberia, Thibet, etc., and from the borders of the Black and Caspian seas.

NATRON LAKES, Natron was one of the substances employed by the ancient Egyptians in embalming mummies. They called it *hesmen*, and, together with the lakes from whence it was derived, it is mentioned in texts of the twelfth dynasty, *circa* 1800 B.C. These lakes, eight in number, are in the vicinity of Zakeek, a village west of the Damietta branch of the Nile. They are below the level of the sea, and the natron is

obtained by evaporation. The locality is also renowned for four monasteries, Deyr Suriana, St. Maiarius, Amba Bishoi, Deyr Baramoos, from whose libraries of Arabic, Coptic, and Syriac MSS. the national collections have been enriched. In the time of St. Pachomius 5,000 anchorets dwelt here; they at present number about 300.

Lepsius, *Todt. Taf.* vii. c. 17, l. 17; Wilkinson, *Mod. Egypt*, i. 382; Brugsch, *Wanderung nach Natron Klöstern* (12mo. Berl. 1855).

NATTERJACK. See TOAD.

NATU'NA ISLANDS, THE, lie to the n.w. of Borneo, between 2° 28′ and 4° 56′ n. lat., and 107° 57′ and 108° 15′ e. longitude. They are densely wooded and mountainous, Ranay, on great Natuna, rising to a height of 3,500 feet. The largest of the islands is about 600 sq. miles. Pop. of the whole about 1300, who grow rice, maize, sago, cocoanuts, etc., and exchange the produce of their fishings, their sago and cocoa-nut oil, for rice, iron, and cottons, at the European settlements on the strait of Malacca.

NATURAL, in music, a note belonging to the diatonic scale of C, and neither elevated by a sharp nor depressed by a flat. When a note has been so elevated or depressed, the natural sign ♮ prefixed to it on its recurrence restores it to its place on the scale. When music is written on a key with a signature of sharps or flats, it is the office of the natural sign to counteract the signature as regards the note to which it is prefixed.

NATURAL BRIDGE, one of the chief natural curiosities in the United States, ranking in interest next, perhaps, to Niagara falls and the Mammoth cave. It is situated in Rockbridge co., Va., 115 m. w. of Richmond, and 160 m. s.w. of Washington. The bridge spans a deep chasm, through which a small stream flows, and is formed by an immense limestone stratum fashioned into an arch 215 ft. high. Its length is 93 ft. and the thickness of the crown of the arch is about 40 feet. The average width of the arch is 80 feet. A public road passes across it from which there is a beautiful view, not only of the long chasm where great forest trees tower up from below but also of the Blue Ridge mountains.—In Walker co., Alabama, and in California also there are other natural bridges, but none that rival this one. The one in Alabama is about 70 ft. high and spans 120 ft.; and the largest of those in California is across a small creek emptying into the Hay fork of Trinity river; is 3,000 ft. wide and has an arch 20 ft. high by 80 ft. across. It has been suggested that these bridges are the remnants of great caverns.

NATURAL HISTORY, in the widest sense, includes all natural science, and has the whole of creation for its subject. In this sense the term was employed by the philosophers of antiquity. But it is now limited to those branches of science which relate to the crust of the earth and its productions. Of these, geology and mineralogy have for their subject inorganic portions of creation; botany and zoology, the various branches of which are often pursued as separate sciences, with physiology, have for their subject organized creatures. Natural history takes cognizance of the productions of nature, and of their relations to each other, with all the changes on the face of the earth, and all the phenomena of life, both animal and vegetable. It derives assistance from other sciences, particularly chemistry and natural philosophy; and some of the branches of chemistry may also be regarded as branches of natural history. When man himself is considered as a subject of scientific study, psychology must be added to the branches of natural history, but in the term as commonly employed this can scarcely be said to be included.

In every department of natural history, classification is of the utmost importance, and scarcely less important is a scientific nomenclature suited to the classification. The subjects of study are so incalculably numerous that an arrangement of them in well-defined groups is necessary to any considerable attainment in the knowledge of them; and it is only by systems of classification which arrange smaller groups in larger, and these in larger and larger again, that natural history has been brought to its present state. The very division of natural history into different sciences is a result of such a classification, and implies a recognition of the largest and highest groups. It is not always in the establishment of these groups that the greatest difficulty is experienced. The primary distinction of all the subjects of natural history into organized and unorganized, or into those having life and those not having life, presents itself very readily to every mind. And equally natural and necessary is the distinction of organized beings into plants and animals, however difficult it has been found to draw the precise limit between the lowest of plants and the lowest of animals. Another distinction readily presents itself to the student of living beings in the kinds which retain the same characters from one generation to another. But here arises one of the most important of all the questions of natural history, what a *species* is, and how it differs from a *variety*. For this we refer to the article SPECIES. But much difference of opinion as there is on this point, the common and long-prevalent notion may be assumed, as suitable enough for guidance in all that relates to classification, that those are distinct *species* which cannot by any change of circumstances—or, let it be said, by any *ordinary* change of circumstances, and within any *moderate* period of time—be so modified as to be transmuted one into another, whilst those are only *varieties* of which the modification and transmutation can be thus effected. Thus,

in botany, *Brassica oleracea* is a species, of which kale, cabbage, cauliflower, broccoli, Brussels sprouts, etc., are varieties. Species, grouped together, according to their natural affinities, form *genera;* but a *genus* does not necessarily consist of more species than one; for, whilst some contain hundreds of species, others, apparently very distinct, contain only one as yet known to naturalists. The distinctions by which genera are separated are of course arbitrary, and are admitted to be so by those who deny that the distinctions between species are arbitrary, or that there is any uncertainty about them but what arises from the imperfection of our knowledge; for, at present, it must be admitted on all hands, that the uncertainty is in innumerable instances very great, what are species and what are varieties. The great object, however, in the formation of *genera* is that they shall be accordant with the facts of nature; and so in regard to the larger or higher groups which are composed of associated genera, as tribes, families, orders, classes, etc. But in all this, the great difficulty is that affinities exist on many sides; and that groups cannot be satisfactorily arranged in the order of a series, but often rather as if they radiated from a common center; whilst otherwise viewed, the same groups might seem to radiate very differently from another common center. A *natural system* is one framed with the utmost possible regard to all these facts; an *artificial system* fixes on one class of facts and proceeds upon it, in disregard of all others. See BOTANY. In the inorganic departments of nature a *species* is of course something different from what it is in the organic. But classification still proceeds on the recognition of facts in nature itself, which it is sought to exhibit in the groups that are formed. See MINERALOGY.

The nomenclature of natural history, in so far as it relates to organic beings, continues essentially as it was established by Linnæus. See GENUS. The names have in many cases been changed, but not the mode of nomenclature.

NATURALISM is the name given in philosophy to those systems which profess to account for the phenomena of nature, by what they call the necessary action of unintelligent and inherent forces. Such, for example, was the doctrine of Lucretius, Leucippus, and Epicurus. It leads also to various forms of theological speculation and belief which deny the agency of a personal God in the production, preservation, and government of the physical, intellectual, and moral universe. In this aspect, therefore, naturalirsm is opposed to theism. See MATERIALISM.

NATURALIZA'TION, the act of placing an alien in the position, or investing him with the rights, of a natural-born citizen. The present arrangements with reference to naturalization, by which the old rule that British allegiance is indelible, has been changed, are embodied in the naturalization act (1870), 33 Vict. c. 14, and the naturalization oath act (1870), 33 and 34 Vict. c. 102. By the former of these statutes it is provided that an alien who has resided in the United Kingdom for a term of not less five years, or has been in the service of the crown for a term of not less than five years, and intends, when naturalized, either to reside in the United Kingdom or to serve under the crown, may apply to one of her majesty's principal secretaries of state for a certificate of naturalization. The applicant is bound to adduce such evidence of his residence, or service, and intention to reside, or serve, as shall satisfy the secretary of state, who may, with or without reason assigned, give or withhold a certificate. No appeal lies from his decision, but his certificate takes no effect until the applicant has taken the oath of allegiance. An alien, to whom a certificate of naturalization has been granted, is entitled to all political and other rights, powers, and privileges; and subject to all obligations to which a natural-born subject is entitled or subject in the United Kingdom, with this qualification, that he, when within the limits of the foreign state of which he was previously a subject, is not deemed a British subject, unless he has ceased to be a subject of the foreign state by the laws thereof, or by a treaty to that effect. Such a certificate may be granted to any person with respect to whose British nationality a doubt exists; and a grant of such special certificate for the purpose of quieting doubts shall not be deemed an admission that the person to whom it was granted was not previously a British subject. Aliens previously naturalized may, on application, obtain certificates. A British subject who has become an alien, in pursuance of this act (see ALIEN), may apply for a certificate of readmission to British nationality on the same conditions as an alien by birth. The secretary of state has, in this case, the same discretion; and an oath of allegiance is likewise required. The privilege of readmission, like that of admission to British nationality, requires that the recipient shall have ceased to be a subject of the foreign state. In the colonies the powers of the secretary of state are conferred on the governor. By the oaths' naturalization act, 33 and 34 Vict. c. 132, any person making or subscribing a false declaration is declared to be guilty of a misdemeanor.

In France, "la grande naturalization" confers political privileges; "la pétite naturalization," gives all the private rights of a French citizen, and it has been doubted whether even public rights are not included in it. In 1867 the term of residence was reduced from ten years to three. A subject of France loses his native character by naturalization in a foreign country, or acceptance of office abroad without permission of the state, or even by establishing himself permanently out of his country. He may recover his rights by renunciation of his foreign office or domicile.

In Prussia the higher administrative authorities can naturalize any stranger who satis-

fics them as to his conduct and means of subsistence. Nomination to a public office confers naturalization. Prussian nationality is lost—(*a*) by discharge upon the subject's request; (*b*) by sentence of the competent authority; (*c*) by living ten years in a foreign country; (*d*) by marriage of a female subject with a foreigner.

In Austria the authorities may confer the rights of citizenship on a person, after ten years' residence within the empire, who has been allowed to exercise a profession. A public functionary becomes thereby invested with rights of citizenship; but admission into the army has not this effect.—In the kingdom of the Netherlands, the power of naturalizing rests in the crown.—In Russia naturalization is effected by taking an oath of allegiance to the emperor.

In the American states five years' residence, and a declaration of intention to become a citizen, emitted before a magistrate, is requisite to naturalization. See *Report of Royal Commissioners on Naturalization* (1869).

NATURALIZATION (*ante*). The right of a citizen to throw off his natural allegiance to the state of his birth and take a similar obligation to a foreign sovereignty has long been contested, and by many nations is not yet fully admitted. In the colonial history of this country the English system of restricting the rights of citizenship seriously conflicted with the obvious policy of a new country to strengthen itself by immigration; and the declaration of independence charges George III. with endeavoring "to prevent the population of these states; obstructing the laws for the naturalization of foreigners; and refusing to pass others to encourage their migration hither." Under the old confederation the exercise of the power of naturalization was vested in the separate states. As the articles provided that the citizens of each state should be entitled to all the privileges and immunities of the citizens of all the several states, much confusion of rights and disagreement as to the legal status of foreigners arose. In the new constitution, therefore, it was provided that "congress shall have power to establish a uniform rule of naturalization" (art. I., sec. 8). In pursuance of this authority congress has passed many acts at various dates from 1802 onward, and treaties have been made with several foreign nations on the subject. The naturalization may be collective, as in the acquisition of new territory by purchase or conquest; or personal, where citizenship is conferred upon an individual upon his complying with the provisions of the law. When once naturalized the applicant possesses all the immunities and privileges of native citizens, with these exceptions: he is not eligible to election as president or vice-president of the United States, and cannot serve as senator until he has been a citizen for nine years, or in the house of representatives until he has been a citizen seven years. (Constitution, art. II., sec. 1; art. I., sec. 2, 3.) In every other particular the naturalized stands on the same footing with the native citizen, and is entitled to the protection of the government abroad as well as at home. Decisions of the U. S. supreme court (1817) definitely settle the rule that the states had no jurisdiction on the subject of naturalization. But they may pass laws admitting foreigners to any privileges which fall short of citizenship; they may confer the right of acquiring and transferring property, or may even make them voters. The policy of the government of this country has always been very liberal in regard to the conditions of acquiring citizenship, as a general increase of population has up to this time been considered most desirable; and though there was weighty authority for the doctrine that an American citizen could not renounce his allegiance without consent of the government and by process of law, yet the state department has always acted on the adverse theory. Without examining in detail the many acts which have been passed to regulate the process of naturalization, the present provisions of the law may be briefly classified as follows: Those persons who have resided in the United States prior to June 18, 1812, may be admitted without any declaration of intention. Any alien, twenty-one years old or more, who has served in the military forces of the United States, may be admitted without preliminary declaration, on proof of one year's residence, of good moral character, and of an honorable discharge from the service. Foreign seamen may obtain full *protection* as American citizens by filing a declaration of intention in a competent court; but to become citizens, in fact, they must afterwards serve three years on a merchant-vessel of the United States, and present at the end of that time a certificate of good conduct and a discharge. In case of an alien minor who has resided in the United States three years immediately preceding his twenty-first birthday and has five years of continuous residence before making application, including the three, declaration of intention is not required; but he must take oath at the time of application that for at least two years he has had the *bona fide* intention of becoming a citizen, and in all other ways must comply with the general rule. The language of the act regulating the naturalization of minors is rather obscure, and it was formerly maintained by many that of his five years' residence, two must be passed after his coming of age, but it is now settled that if the residence extends from his fifteenth to twenty-first year it will suffice. The children of foreign parents who are naturalized become so also, if minors and living in this country at the time, and it has been held that the naturalization of the father only suffices. Any person not coming under the classes already mentioned must, at least two years before admission, make oath before a district or circuit court of the United States, or before any court of law having common law jurisdiction and possessing a seal and clerk, that it is his *bona fide* intention to become a citizen and to renounce

forever all allegiance to any foreign prince, potentate, state, or sovereignty; and, by name, that particular prince, state, or sovereignty, of which he is at that time a subject or citizen. A certificate of the fact that such a declaration has been made is made out by the clerk, signed and sealed and given to the applicant as evidence of the declaration of intention. Five years' residence in the country, and one year in the state where the application is made, are necessary; by residence is meant permanent abode, but it is not affected by temporary absence on business or pleasure. The court must also be satisfied that the person applying is of good character and well disposed to the public welfare and the principles of the constitution. If the alien have hitherto possessed any hereditary title or order of nobility, he must forever renounce it. As to evidence, that of residence must rest on other proof than the applicant's oath, but a single witness is taken on this point, and on others the alien's oath is generally deemed sufficient. The depositions, certificate of declaration of intention, and the final order of admission, compose the record of the case and are put on file. A certificate of naturalization is made out, sealed, and signed by the court clerk and is given to the alien as evidence of his citizenship. The record is conclusive and cannot be contradicted or overthrown, except by proof of perjury or other fraud in its procural. Severe punishment by fine and imprisonment is provided for the taking of any false oath or affirmation in connection with the proceedings; for any false personation either by applicant or witness; for counterfeiting or imitating any instrument, paper, or proceeding used in the case or authorized by the naturalization laws; for selling or disposing any such oath, certificate or notice, as genuine, or for falsely representing one's self as a citizen of the United States without having been duly admitted to citizenship. Aliens who are subject to a country at war with the United States at the time of application cannot be naturalized while the war continues. In the early days it was several times held that the wife of a naturalized alien had not herself acquired the status of a citizen, if originally alien; but it was long since decided by the supreme court that the citizenship of the wife should follow the naturalization of the husband, and that it makes no difference whether the marriage is contracted before or after the citizenship of the husband is secured. The right of expatriation, as it is called, that is of freedom to throw off the natural allegiance and acquire a new allegiance to another government, is now generally recognized by the nations of Europe and America, though not as a matter of inherent right but rather of permission from the authorities, and as a matter of public policy to prevent disagreeable international complication. The English act of 1870 provides both for the naturalization of aliens, after five years' residence and application to the secretary of state, and also that any British subject who shall voluntarily become naturalized in any foreign country shall from that time on be regarded as an alien and no longer a British subject. A treaty was entered into in the same year between Great Britain and our country, providing that aliens who have complied with the conditions of admission and have been fully naturalized should be recognized as such by the country of their birth; but the original allegiance may be recovered by much the same process. Treaties were also made by the United States, in 1868, with Prussia, Bavaria, the grand duchy of Baden, Würtemburg, grand duchy of Hesse, Belgium, and Mexico; in 1869 with Sweden and Norway; in 1870 with the Austro Hungarian empire, and in 1872 with Ecuador and Denmark. These treaties have the same general stipulations, stating a period of residence, usually five years, after which naturalization is permissible and to be recognized, reserving to the country of the original allegiance the right to punish for crime committed, or to compel the execution of obligations entered into, before the change of domicile, and entering into mutual obligations to recognize the rights of each other. The question on which there is the greatest likelihood of disagreement under existing laws, arises where an alien comes to this country, becomes duly naturalized and then returns. Is he then liable to undergo military service or otherwise recognize the allegiance of the state of his birth? Some European nations hold that such a transaction is on its face evidence of an intention to escape the natural obligations, but the policy of our government has always been to protect its adopted citizens where the naturalization is not tainted by fraud.

NATURAL'IZED. In the language of botanists and zoologists, those plants and animals are said to be *naturalized* in any country, which, having been introduced into it by man, have established themselves so as to exist without his care. A plant or animal is never said to be naturalized so long as it exists merely in a state of cultivation or domestication, but is so when it becomes truly wild, and, unaided, competes successfully for a place among those which are indigenous to the country. Thus, the horse is not naturalized in Britain, or in most of the countries in which it is most highly valued; but both the horse and the ox may be said to be naturalized in South America. Many of the plants now most characteristic of southern Europe are sometimes said to have been originally introduced from the east; and some that are abundant in many parts of Britain were, in all probability, brought from the continent of Europe. Some of these almost evince their foreign origin by growing chiefly near ruins, or in places which have long been the seats of human habitation. Many plants now naturalized in Britain appear to have been originally brought for medicinal use, although now disregarded. In many cases, however, naturalization has taken place without any attempt having ever been made by man to introduce the plant, even for cultivation; and thus many Euro-

pean weeds are now common in America, the seeds having found their way thither with those of more valuable plants, or in some such accidental manner. The same thing has taken place as to animals. Thus mice and rats find their way from one country to another; thus the bed-bug found its way at no remote date to Britain; other insects have been even more recently introduced with foreign productions of different kinds; and a mollusk (see DREISSENA), previously unknown, has established itself in some British rivers and canals. The pheasant may be mentioned as an instance of naturalization in Britain designed and successfully accomplished by man. An *acclimatization society* has recently been formed in London, which has for its object the naturalizing, rather than what may more strictly be called the acclimatizing, of animals deemed suitable and desirable. It is unquestionable that much may be done by naturalization of animals, not only to render rural scenes more attractive, but also to increase their economical productiveness. Perhaps nothing of this kind has received so little of the attention due to its importance as the naturalization of fishes. See PISCICULTURE.

NATURAL OBLIGATION, in law, means an obligation which is supposed to be prescribed by the law of nature, as the obligation of a parent to maintain his child. In England such an obligation is not recognized by the common law, and therefore it was necessary in the poor-law statutes to punish by a penalty parents who, being able, refused or declined to maintain their children. In Scotland the natural obligation of a parent to maintain his child is, however, recognized by the common law, though it is also enforced by the poor-law statute.

NATURAL PHILOSOPHY is a term frequently employed in Great Britain to designate that branch of physical science which has for its subject those properties and phenomena of bodies which are unaccompanied by any essential change in the bodies themselves. It thus includes the various sciences which are classed under *physics* (q.v.) in the limited sense of that term.

NATURAL THEOLOGY is the name given to that branch of moral science which concerns itself with the evidences for the existence of God, drawn from an inquiry into the constitution of the universe. It is believed by the majority of philosophical thinkers that these evidences warrant the belief in a Being of infinite power, wisdom, benevolence, and justice. There are, however, philosophers of great eminence who deny that there is such a thing as natural theology, who say that nature, at the best, gives forth an uncertain sound regarding the existence of a Supreme Being, and that a logical demonstration of such existence is impossible, and has always broken down. This view is held, for example, by atheists like David Hume, and the recent Scoto-Oxonian school of metaphysicians, of whom the principal representative is dean Mansel. The standard English work on the subject has long been Paley's *Natural Theology* (Lond. 1802; new edition by lord Brougham and sir Charles Bell, 1836). The Bridgewater and Burnett Treatises are also contributions to this branch of science.

NATURAL THEOLOGY (*ante*), the name applied to the knowledge concerning the existence and attributes of God, furnished by the organized universe. This knowledge springs from the answers to two questions: 1. Is this complicated universe the work of a personal creator, or a result of impersonal force? 2. If of a personal creator, what does it, as his work, show concerning his character, attributes, and relations to his creatures? The answers to these questions depend on the assumptions that every change must be effected by some adequate cause, and that design proves the existence of a designer, whose attributes and character are indicated in his work. The basis for these assumptions is found, by the best thinkers, in the intuitive beliefs of the human mind. While any instance and degree of design prove the existence of a designer, the sum total of all instances and all degrees must be taken, in order to a full knowledge of the designers; and if, in all the instances, unity of design be manifested, then the existence of one designer, adequate to all the work, is proved. The investigation, therefore, requires the examination of all orders of objects and creatures, of all degrees of complexity and completeness in the properties, qualities, constitutions, and relations, physical, mental, and moral, which they display. The examination may be practicable only in part, and only as to results; but in proportion as it can be completely made and can be extended also to the means and processes by which the design has been carried into effect, the proof of high qualities in the designer will be increased. The proof of design in Paley's often cited instance of a watch, picked up in crossing a heath, cannot be set aside by raising questions concerning the length of time employed, or the instruments used in its construction; and while the slightest inspection of it may furnish proof of design, the proof will be strengthened and the display of design increased by a thorough and skillful examination of its complicated mechanism. If machinery that will make many watches be examined, the degree of design will be proportionally greater; and if a watch could be made to throw off other watches as a part of its work, instead of the proof of design being abrogated, it would be marvelously increased. Some persons, indeed, claiming to be philosophers, seek to limit all investigation to the phenomena of nature, denying or disregarding efficient and final causes as either not existing or not proved. They say, "Our reflecting reason is the sole cause of all the apparent design which exists and which is nothing but the combination of natural materials and forces."

But, to this assertion it is sufficient to reply that it fails to account (1) for the existence of the natural materials and forces; (2) for the combination of them in the production of one result; (3) for the existence of the reason of man, which is capable of reflection, and (4) that it does not show how reason can be the cause of a design—or of anything else—which is only apparent, not real. The history of mankind shows that there has at all times existed, in the mind, some idea of God, or of gods, or of some supernatural beings, to be sought, worshiped, or feared. Some, indeed, have asserted that the most degraded tribes have no such idea, and that the deaf and dumb also are destitute of it until they are instructed. But to this it is answered that while, in the lowest degradation, the *light* of the idea may be nearly or quite extinguished, enough of dark superstition remains to show that the light once shone; as, in an extinguished or dimly burning lamp, the very blackness of the wick proves the previous existence of a brighter flame. And, as to the deaf and dumb, granting the facts alleged, it cannot be certainly maintained that they have no idea of God, because they, in their want of education, cannot express it in language; or we, in our imperfect intercourse with them, cannot draw it forth from their minds. Some have regarded the idea of God as innate in the human mind, from the fact that the belief in his existence has been so general in all ages of the world. But this theory is now held, if at all, only in the modified form that in the development of the mind the idea of God is certainly reached through the study of nature and of man.

NATURE-PRINTING. This is a process by which engravings or plates answering thereto are produced by taking impressions of the objects themselves, and printing from them. There is some dispute as to the original inventor of this art; Denmark claims it for a native of Copenhagen, Peter Kyle, a goldsmith, who died about 1833, leaving the MS. description of his invention in the archives of the royal collection of engravings in that capital. It is, however, admitted that no use was made of his invention. In 1853, Alois Auer, director of the state printing establishment of the Austrian empire, published his process, and also some very beautiful works illustrated by this art. About the same time, in England, Mr. G. W. Aitkin made known his discovery of an exactly similar process, and showed some very beautiful plates of feathers, ferns, etc. But whatever other claims may be advanced, it is certain that Alois Auer holds undisputed right to the title of original inventor and practical applier of the invention. The process is very simple, as practiced by Auer; but it cannot be applied to any objects except those with tolerably flat surfaces, such as dried and pressed plants, embroidery and lace, and a very few animal productions. The object is placed between a plate of copper and another of lead, both worked smooth, and polished; they are drawn through a pair of rollers, under considerable pressure—M. Auer says 40 to 50 tons; then, when the plates are separated, it is found that a most beautiful and perfect impression of the object has been made in the leaden plate. This may be used directly as an engraved plate, if only a very few impressions are wanted; but as it is too soft to resist the action of the press for practical purposes, a fac-simile of it is obtained in copper by the electrotype process, which is used as the printing-plate. The best practical use to which nature-printing has yet been applied is the multiplication of patterns of lace and other figured surfaces, either in textile materials or metals, for trade purposes. Lace-prints especially are so exactly like the originals that the most fastidious can require nothing more; hence the cutting up of valuable pieces of lace for patterns has been saved. Henry Bradbury, of the then existing firm of Bradbury & Evans, London, made nature-printing his special study, and produced the exquisite works, *Nature-printed Ferns*, and *Nature-printed Sea-Weeds*, in 2 vols. each (London: Bradbury & Evans).

NAUGATUCK, Conn. See page 887.

NAUHEIM, a t. in the duchy of Hesse-Darmstadt, Germany, n. of Frankfort; pop. 2,500. Its mineral springs attract many visitors annually. The waters, both as an external and internal application, are highly valued as a remedy for diseases of the bowels and cutaneous affections. Mineral springs abound in the vicinity also, and their waters, with those of Nauheim, are extensively exported for use in other parts of Germany. Salt-works had long existed at Nauheim, but the baths were not opened till 1834. A fountain, opened by a shock of earthquake in 1846, produces some 75,000 quintals of salt per year, besides furnishing a supply of water for the bath-houses. Gambling, which was formerly extensively practiced, has been abolished.

NAUMA'CHIA, a Greek word, signifying literally a naval battle, afterwards, among the Romans, a spectacle which consisted in the imitation of a naval battle. Julius Cæsar was the first to introduce a naumachia into Rome, 46 B.C., causing a portion of the Campus Martius to be dug to form a lake, on which the "spectacle" came off. Augustus made an artificial lake (*stagnum*) near the Tiber for the same purpose, which was afterwards frequently used for naumachiæ. Claudius also exhibited a splendid one on lake Fucinus. Nero, Domitian, and others were likewise fond of such amusements. The combatants were termed *naumachariï;* they were for the most part either captives or condemned criminals; and the rival fleets took their names from the famous maritime nations of antiquity: Tyrians and Egyptians, Rhodians and Sicilians, Persians and Athenians, Corcyræans and Corinthians, Athenians and Syracusans. The magnificence of these spectacles may be estimated from the fact that in the one exhibited on lake Fucinus 19,000 men were engaged. These *naumachiæ* were not *sham-fights*, any more than ordinary gladiatorial combats. Both sides fought on in real earnest for dear life

until one was utterly overpowered; and, as a rule, multitudes were "butchered to make a Roman holiday."

NAUMANN, Emil, b. Berlin, 1828; son of Moritz Ernst Adolf. He studied music under Mendelssohn, and in 1848 brought out his first composition of importance, an oratorio called *Christ, the Messenger of Peace.* In 1852 he published a study of German church music, under the title of *The Transformation of Protestant Church Music.* About the same time he became director of church music at Berlin. He has since written, besides many compositions in sacred music, a number of operas, of which *The Witch of the Mill* and *Judith* deserve mention, and a cantata on the *Destruction of Jerusalem.* His work on the *Introduction of Psalmody into the Evangelical Church* appeared in 1856, and his *Music in the History of Civilization* in 1870.

NAUMANN, Karl Friedrich, 1797–1874; b. Germany; educated at the Freiberg school of mines, and at the universities of Jena and Leipsic. In 1821 he made a journey to Norway for scientific purposes, and the results of his observations were published in his *Contributions to the Knowledge of Norway*, 2 vols., 1824. Two years later he became professor of crystallography at Freiberg, and in 1835 he was transferred to the chair of geognosy in the same institution. In 1842 he was called to the chair of geognosy and mineralogy at Leipsic. The most important of his works on mineralogy and geognosy are: *Elements of Crystallography*, 1841; *Elements of Mineralogy*, which ran through many editions; and *Manual of Geognosy.* He became privy councilor of mines in 1866.

NAUM'BURG, a t. of Prussian Saxony, in the government of Merseburg, situated 17 m. s.s.w. of the town of that name, on the Saale, in the midst of a striking amphitheater of vine-clad hills. Besides its cathedral—a noble Gothic structure, completed in 1249, with two choirs, and containing many beautiful sculptures—there are several other churches. The manufactures are cotton and woolen fabrics, leather, and chemical products. Wine is grown in the vicinity in considerable quantity—11,000 gallons yearly. During the thirty years' war, and in the campaigns of 1806 and 1813, Naumburg, in which the Prussian magazines were lodged, was a place of great importance. Five annual fairs are held here. Pop. '80, 17,868.

NAUPACTUS. See Lepanto, *ante.*

NAUP'LIA, a small fortified t. and seaport in the Morea, Greece, at the northern extremity of the gulf of Argos or Nauplia, and 7 m. s.e. of the town of Argos. It is laid out in the manner of a European town. Its roadstead is one of the best in Greece. In the church of St. Spiridion, Capo d'Istria was assassinated in 1831. Nauplia is of high antiquity. At an early period it was the port and arsenal of Argos. In the 13th c. it was occupied by the Venetians, and was taken by the Turks in 1540. From 1824 to 1835 it was the capital of Greece, and had a population of upwards of 12,000; but on the removal of the court to Athens it fell into decay. Pop. about 4,000.

NAU'SEA is a distressing sensation always referred to the stomach. It is unattended by pain, but is usually accompanied by a feeling of general languor or debility, a small and often irregular pulse, a pale, cool, and moist skin, general muscular relaxation, an increased flow of saliva, and a sensation that vomiting will supervene. It is most commonly a *direct* symptom of disease or disorder of the stomach, but sometimes it is a very important *indirect* symptom of disease of some part at a distance from the stomach—as, for example, the brain or the kidney. The nausea which is so troublesome to pregnant women is due to the irritation excited by the enlarged uterus being reflected by nervous agency to the stomach.

NAUSETS. See Massachusetts Indians.

NAUSHON. See Elizabeth Islands.

NAU'TÆ, CAUPO'NES, ETC. These words are the commencement of an edict in Roman law, which made shipmasters, innkeepers, and stablers liable for the safety of the goods brought into the ship, inn, or stable. The same doctrine is adopted by the common law of England and Scotland, subject to variations produced by the carriers' act, and railway and canal traffic act, so far as regards carriers and railway and canal companies.

NAU'TICAL ALMANAC, a work projected for the special behoof of astronomers and navigators. See Almanac. It is chiefly valuable to the latter class from its containing tables of the "lunar distances,"—i.e., distances of the moon from a few (5 to 7) of the more prominent stars, given for every three hours throughout the year—by which at the present day longitudes (see Latitude and Longitude) are most conveniently and accurately determined. To the astronomer the *Nautical Almanac* furnishes a great mass of important data; it gives the position of the moon in right ascension and declination for every hour, and the sun's latitude and longitude for every day in the year; it shows the obliquity of the ecliptic, the sun's and moon's parallax, aberration, etc., at different times; it supplies the necessary data for the determination of the real or apparent size, position, and motion of the planets and their satellites; it fixes accurately the places of about 150 fixed stars, and gives full details concerning eclipses, occultations, transits, and other celestial phenomena occurring during the year. It is generally issued four years in advance for the sake of mariners going on long voyages.

NAUTICAL SURVEYING. See HYDROGRAPHY, *ante.*

NAU'TILUS, a genus of *tetrabranchiate cephalapoda* (q.v.), extremely interesting as the existing representatives of an order of mollusks now reduced to a very few species, but of which the fossil remains attest the great abundance in former geological periods. The species of this genus are found only in the seas of warm climates. One or more of them must have been known to Aristotle, as appears from his description, which, however, is not minute. Yet it is but recently that they came under the observation of modern naturalists; and they were very imperfectly known, till a specimen, obtained by Dr. Bennett in a bay of the New Hebrides in 1829, was submitted to the examination of prof. Owen, and became the subject of a valuable memoir by him. The shell, indeed, has long been common enough in collections, being plentifully found, entire or in fragments, on many tropical shores; but from the shell alone little could be learned concerning the animal to which it belonged. The shell is spiral, the spire not at all elevated; and thus, in external form, resembles the shells of many species of snail; but internally it is *camerated*, or divided into chambers, by transverse curved partitions of shelly matter. In a very young state this structure does not exist; but as the animal increases in size it deserts its first habitation, which then becomes an empty chamber, and so proceeds from one to another still larger, occupying the outermost only, but retaining a connection with all by means of a membranous tube (*siphuncle*) which passes through the center of each partition. The use of this connection is not known; but the most probable supposition is that the animal is enabled, by throwing air or some kind of gas into the empty chambers of the shell, or by exhausting them of air, to change the total weight, so that it may rise or sink in the water at pleasure. It commonly inhabits the bottom of the sea, where it creeps about, probably like the gasteropods, by means of a large muscular disk with which the head is furnished; but it sometimes rises to the surface, and is to be seen floating there. Dr. Bennett states that the specimen which he fortunately captured attracted his attention, when thus floating, as an object resembling a dead tortoise-shell cat. The story of its spreading a sail is as fabulous as the similar story regarding the argonaut. The head and arms can be protruded from the shell, and can also be completely retracted within it. There are numerous arms attached to the head, 19 in the best-known species; there are also numerous other tentacles; but none of these organs are furnished with suckers, and they are feeble in comparison with the corresponding organs of many of the higher or dibranchiate cephalopods. The mouth is of the parrot's-bill form, as in the other cephalopods; but the mandibles are not entirely composed of horny matter, their extremities being calcareous and of a hardness apparently adapted for breaking shells. Their edges are also notched, and show an adaptation for crushing rather than for cutting. The tongue is large. The gizzard is muscular. The food appears to consist, at least in great part, of crustaceans.

Only three species of nautilus are known, of which the best known and apparently the most abundant is the PEARLY NAUTILUS (*N. pompilius*), which is found in the Indian and the Pacific oceans. Its shell is beautifully nacreous within; and is externally porcelain-like, white, and streaked with reddish chestnut. The shell, being large, thick, and strong, is used for a variety of purposes by the natives of the East Indies and South Sea islands; it is also made into ornaments of various kinds in China and elsewhere. The animal is eaten by the Fijians and other South Sea islanders, and is much esteemed as an article of food. The Fijians capture it by means of a basket-trap, somewhat like those used for catching lobsters, baited with boiled crayfish. The name PAPER NAUTILUS has sometimes been given to the argonaut (q.v.).

Fossil Nautilus.—About 150 species of fossil shells have been referred to this genus. They occur in all the strata from the upper silurian to the most recent deposits. Numerous forms, however, which exhibit very wide differences, have been incongruously associated under this generic name. The paleozoic nautili are so remarkable that they must certainly be referred to one or more separate genera; some of the carboniferous species have a square back, and the whorls either compact or open in the center, while the last chamber is more or less disunited from the shell; and the Devonian clymenia has angular sutures and an internal siphuncle. Until a careful revision of this section of the cephalopoda is made it will be better to consider the species as belonging to the family *nautilidæ*, and not to the genus *nautilus.*

NAU'TILUS PROPELLER was long the best known among many names given to a mode of propelling steam-vessels by means of a horizontal wheel within board, instead of a paddle or a screw on the outside. *Hydraulic* propeller has latterly come more into use. Engineers thought of this mode of propulsion generations ago, and patents have been taken out for inventions relating to it by Toogood, Hayes, Rumsey, Linaker, Hall, and others; but the most successful attempts to realize it have been those of Mr. Ruthven. He constructed a small boat, 9 ft. long, in 1839 (tried on the Union canal), and a vessel, 40 ft. long, in 1844 (tried on the Forth), to test the principle; each was worked by a small steam-engine, and provided with the hydraulic apparatus. In 1849 Mr. Ruthven made improvements in the apparatus, and introduced them in a vessel, 30 ft. long, tried upon the Thames. In 1851 he placed a boat in the great exhibition. In 1853 a vessel on this principle, called the *Albert*, was built in Prussia by M. Sydel, the machinery being supplied by Mr. Ruthven. She plied on the Oder as a passenger-steamer for many

years, and illustrated favorably some of the characteristic features of the nautilus system. The term of Mr. Ruthven's patent expired, however, before the invention had worked its way into use in England; and the privy council, in 1863, gave a further term of ten years. He afterwards began building a vessel to be called the *Nautilus;* while the admiralty authorized the commencement of the gun-vessel *Waterwitch*, both to be worked on the Ruthven principle.

The *Nautilus* was first tried on the Thames in April, 1866. It is fitted with two steam engines, of 10 (nominal) horse-power eac, with cylinders of 17 in. diameter, and 2 ft. stroke. Water is admitted through apertures in the bottom of the vessel into a water-tight iron case or compartment. In this case is placed a horizontal so-called turbine-wheel, 7 ft. in diameter, acted on from a vertical shaft connected with the steam-cylinders. The wheel is divided into compartments by plates or radii of peculiar curvature, and is placed below the water-line of the vessel, so as to be always immersed. Two pipes extend to the wheel-case, one to either side of the vessel, where they emerge nearly at midship. Each pipe terminates with nozzles, 10 in. in diameter, placed outside the vessel at right angles to the pipes; insomuch that each side of the vessel has a nozzle pointing ahead and another pointing astern. A valve is fitted to each pipe, at its junction with the nozzles, to open the passage to one nozzle and close it against the other; and the movement both of the starboard and the port valves can be governed from a raised deck built over the engine-house. The wheel-ease is always full, or nearly full, of water, which enters through the apertures in the bottom of the vessel. When the wheel is made to rotate horizontally by the steam-engines, water is drawn in through the hollow axis, and expelled at the periphery by centrifugal force; it can only find an outlet through the two pipes, and then through the nozzles which terminate them. Supposing the nozzles pointing astern to be open, and those pointing ahead to be closed, the vessel is propelled forward by the resistance of the water of the river or sea to that rushing out of the nozzles; when the forward nozzles are open, and the hinder ones closed, the vessel is propelled backward, or driven astern. The captain, standing on the raised deck, and commanding both valves, can close the fore-nozzles, and open the aft, which makes the vessel go ahead; he can open the fore and close the aft, which makes her go astern; he can open one fore-nozzle, and close the other, which makes her turn. The exit of the water from the nozzles is a little above sea-level, a plan found to be better than actually immersing them. In one of the trial-trips of the *Nautilus*, with strong wind and tide urging her on, and going at full speed, she was stopped dead in less than 10 seconds. and in about a quarter of her length, by simply reversing the valves.

The performance of the *Nautilus* was satisfactory enough to lead the admiralty to expedite the finishing of the *Waterwiich,* an iron-clad gun-vessel of 778 tons and 160 horse-power. The wheel is rotated by an engine having three separate cylinders each 38½ in. diameter by 3 ft. 6 in. stroke. The vessel was built at the Thames iron-works, and engined by Messrs. J. & W. Dudgeon of Blackwall. Its turbine-wheel is 14 ft. diameter; it rotates (at full engine-power) 39 times per minute. The brass discharge-nozzles, which measure 24 in. by 19⅛, are continued along the outside of the vessel 8 ft. on each side of the center; the lower lips of the discharge-nozzles are 8 in. below water-line, the remainder of the aperture being above water. The *Waterwitch* is flat-bottomed and double-ended, i.e., she has a rudder at each end, so that she can steer equally well when going ahead or astern. Her total cost was £60,000, of which no less than £13,600 was for the engines.

As regards her speed and the efficiency of her machinery, the *Waterwitch* did not do all that was expected of her; she was neither more nor less successful than her sister ships, the *Viper* and *Vixen,* and they all three belonged to the slowest class of gun-boats. As her machinery was much more expensive than that of the others, nothing has as yet been done in the way of adding to the number of hydraulic engines in the navy. They possess many advantages in regard to maneuvering the ship, but these are to a great extent also possessed by twin-screw engines, which can be made at a less cost; while some of the advantages originally claimed for them, such as freedom from slip, have not been realized in actual work. In such exceptional vessels as those of the *Viper* class, a fair comparison of the merits of the hydraulic propeller with those in common use cannot be made. The net result of the experiments hitherto made is, that while the addition of one additional part to the machinery between the engines and the actual propellers (which in this case are the columns of water) is open to grave objections; still with a "turbine" less faulty in design, and under more favorable circumstances, the hydraulic propeller may be found useful in men-of-war. The *Waterwitch*, as well as her non-hydraulic sister ships, now ranks among the "inefficients" of the navy, having been pronounced useless for purposes of modern warfare.

NAUVOO', a t. in Illinois, on the e. bank of the Mississippi river, 220 m. above St. Louis. It was built by the Mormons in 1840, and in 1846 contained a population of 15,000. Its principal feature was a great temple of polished marble, original in style, and imposing in appearance. After the murder of Joseph Smith, the Mormon prophet (see MORMONS), and the expulsion of his followers, the temple was burned. The town was afterward bought and occupied by a French socialist community, under the leadership of M. Cabet. This experiment having proved, like others, a failure, the once famous city has been reduced to an inconsiderable village.

NAVA'JOS, a tribe of Indians belonging to the family of Shoshones and Apaches, and occupying a reservation in n.w. New Mexico and n. e. Arizona, comprising nearly 3,500,000 acres. They were formerly hostiles, but were subdued by the U. S. troops, and are at present peaceable and industrious. They number over 17,000, and possess 130,000 sheep and goats, and 10,000 horses. A specialty with this tribe is the manufacture of the Navajo blankets, which are valued for their warmth and durability.

NAVAL ACADEMY, U. S. See UNITED STATES NAVAL ACADEMY.

NAVAL ARCHITECTURE. See SHIP-BUILDING.

NAVAL CADETS are the youths training for service as naval officers. Every admiral on hoisting his flag may nominate 2, every capt. 1 cadet. The boy must be between 12 and 13½ years old. He is examined at the royal naval college at Greenwich, and if he passes, is sent for 2 years to the *Britannia* training-ship, at Dartmouth. At the end of that time, if he has progressed satisfactorily, he is put into a sea-going ship, and becomes a midshipman at once if he has gained a first-class certificate.

NAVAL CROWN, in heraldry, a rim of gold round which are placed alternately prows of galleys and square sails. The device is said to have originated with the Roman emperor Claudius, who, after the conquest of Britain, instituted it as a reward for maritime services. He who first boarded the enemy's ship, and was the occasion of its being captured, was entitled to a naval crown. A naval crown supporting the crest in place of a wreath, occurs in various grants of arms in the early part of the present century, to the naval heroes of the late war. The crest of the earl of St. Vincent, bestowed on him after his victory over the Spanish fleet in 1797, is issuing out of a naval crown or, enwrapped by a wreath of laurel vert, a demi-pegasus argent maned and hoofed of the first and winged azure, charged in the wing with a fleur-de-lis or.

NAVAL RESERVE, ROYAL, is a sort of militia, auxiliary to the royal navy. It is a force held in high esteem by naval men; and is considered an extremely valuable reserve of trained men ready to man the fleet in case of emergency. The force was instituted in 1859, under the act 22 and 23 Vict. c. 40. That act authorizes the engagement of 30,000 men, each for a period of 5 years, and provides that each shall be trained, for 28 days in every year, to the use of arms and naval tactics, either in her majesty's ships or on shore. In case of national emergency these men can, by royal proclamation, be called out for service in the navy in any part of the world, for periods not exceeding 5 years. While training and while called out for actual service, the men receive the same wages as corresponding ratings in the royal navy: in addition, they each receive, as retaining fee, a sum of £6 for every year in which the regulated training has been completed. On actual service, after 3 years—whether of uninterrupted service, or at broken intervals—the volunteer becomes entitled to twopence extra per diem. The man can terminate his engagement at the end of 5 years, unless on actual service, when the queen may require him to complete 5 years of such service before discharging him. During the continuance of his engagement, he must not embark on voyages which shall entail a longer absence from the United Kingdom than 6 months, unless with special permission of the admiralty. The periods of training are made as far as practicable to suit the sailor's convenience: he may break the 28 days into shorter periods, none being less than 7 days. He is drilled as near as practicable to his own home, the drilling being intrusted to the officers of the coast-guard. While drilling, if on board a queen's ship, he has the regulation victuals; if billeted on shore, while training for great-gun exercise in batteries, he is allowed 1s. 4d. a day for victuals. It is optional with the volunteer to renew his engagement from time to time, as the respective periods of 5 years expire; and at about the age of 45 he becomes entitled to a pension of £12 or upwards for the rest of his life, subject to the usual obligation of service in certain circumstances in the navy, which all pensioners are under. This pension may be commuted, if desired, into one of less amount, to last until the death of the longest liver of the volunteer and his wife.

To be eligible for the royal naval reserve, a man must be a British subject, under 35 years of age, in good health, and, within the preceding 10 years, must have served at least 5 years at sea, of which 1 year shall have been as able seaman. Soldiers, militiamen, and coast volunteers are ineligible, and subject to a penalty if they join; but a member of the last force may obtain his discharge therefrom for the purpose of joining the naval reserve. Penalties are enacted in case men fail to attend; and failure after proper notice to come up for actual service is held equivalent to desertion. While training or on duty, the men are liable to all the punishments, as they are entitled to all the rights and privileges of regular seamen. The men considered most desirable are (1) those having fixed residences, and personally known to the shipping-master or his deputies; and (2) men having regular employment in the coasting-trade, or in vessels the business of which brings them back to the same ports at frequent and known intervals. In 1884, about 20,000 men belonged to the naval reserve, and were in a state of great efficiency.

In 1861 the system of the reserve was extended—by the act 24 and 25 Vict. c. 129—to officers of the merchant-service, certificated masters and mates being respectively granted commissions in the naval reserve as lieuts. and sub.lieuts. The holders are required to train for 28 days annually on board her majesty's ships, and are liable to be called out

for actual service when required. When training, or on actual service, lieuts. receive 10s., and sub-lieuts. 7s. per day, with all the privileges, pensions for wounds, pensions to widows, uniforms, etc., of naval officers of corresponding rank. The number of these officers allowed by regulation is 130 lieuts. and 270 sub-lieuts.: of these, in 1874, commissions had been granted to 117 lieuts., 78 sub-lieuts., and 2 engineers. The total cost of the naval reserve, officers and men, for the year 1884–85, was estimated at £212,339.

NAVAL SIGNALS. Communication between vessels by flags or smoke by day, by lights at night, has always been in practice; as well as a kind of arbitrary code for tacking, etc., etc., when beating through a passage, by the movements of a single flag. The modern systems are by different colored flags by day, and by lanterns or blue-lights at night. The electric light is destined to become of great utility in this line, but whether the flash-light, now extensively used by the English armies, can be used on ship-board, remains to be seen. The signals are numbered, and, in the navy, the signal-book is always bound in lead, and is thrown over on surrender; the admiralty service requiring some fifty flags. The merchant service needs fewer combinations; the present code, that of the British board of trade, introduced just before our last war, needing eighteen flags, covering 20,000 signals, which may represent 70,000 numbers. From the book the number is read off, then the word or sentence opposite, and combinations are made if necessary to complete the communication.

NAVAL TACTICS. Modern naval tactics, as embodying a series of rules for maneuvering to the best advantage, corresponding to what is known on land as "*la grande guerre*," may be said to date only from the time of Cromwell's admiral, Blake. Little change from then till the war of 1812 took place in the general principles of attack, with the single exception of the introduction of reliable mortars, but at that date the invention of the breech-sight altered the conditions of the problems as regards range. The introduction of steam causes the next change at the battle of Navarino, since when evolutions under steam form the subject of greatest consequence. Armor and projectile are constantly opposed, nor is it likely that either can long hold the balance, until the introduction of some extraneous factor, like torpedoes exploded by electricity, shall definitely change the efforts of seamen and constructors to a new direction. Our late war proved that heavy ordnance might be silenced by the successive attack of unarmored vessels; and admiral Tegethoff, at the battle of Lissa, sunk, with wooden ships, the finest iron-clads of that day. In a squadron consisting of eight or more vessels, moving in line, or a column in echelon—that is in column, say, from n. to s., but each vessel heading n.w. movements are executed much on the principles of army tactics—by division, half-division, or single vessels. Thus, from line into column, upon right, left, or center; double column, wheels, changing of front, right about, by either flank, in echelon, and at various distances. Foxhall A. Parker (*Squad. Tactics under Steam*, New York, 1864), then a commander, proposed, as the necessary signals were not in the code, a series of signals for maneuver and change of direction, counting from the right by quarter points. Nos. 1 to 32 indicated points of the compass, and from 33 to 116 orders for movements.

NA'VAN, a market t. of Meath county, Ireland, situated at the junction of the Boyne and Blackwater, 28 m. n.w. of Dublin, with which city it is connected by two railways. Pop. '71, 4,104, of whom 3,868 were Catholics, 203 Episcopalian-Protestants, and the rest of other denominations. Pop.'81, 3,823. Navan is one of the most ancient boroughs in Ireland, and returned two members to the Irish parliament. It possesses considerable inland trade, a flax-mill, several flour-mills, and two paper-mills, besides a tannery, a brewery, and two distilleries. There are also an endowed school, a Roman Catholic seminary (one of the first opened in Ireland after the repeal of the penal law), and four national schools, containing (1871) 1304 pupils, of whom 699 were boys, and 605 girls. The two girls' schools are attached to the Roman Catholic convent. Several interesting remains, both Celtic and Norman-English, are found in Navan and the vicinity.

NAVARI'NO, or Neo-Castro, a sea-port and citadel on the s.w. coast of the Morea in Greece, contains only 2,000 inhabitants, but is of importance from its position, commanding the entrance of the bay of Navarino, at the southern extremity of which it is situated. On the island of Sphagia or Sphacteria, which closes the bay's mouth, was formerly situated Pylus Messeniaca, the town of Nestor, in a spot where now stands old Navarino or Palæocastron. The bay of Navarino was the scene of a great sea-fight between the Athenians under Cleon, and the Spartans (425 B.C.), in which the latter were defeated; and on Oct. 20, 1827, it saw the annihilation of the Turkish and Egyptian navies by the combined British, French, and Russian fleets under sir Edward Codrington.

NAVARRE', a province, and formerly a kingdom of Spain, is bounded on the n. by France, on the s. and e. by Aragon, and on the w. by the Biscays; and is situated in 42° 20′ to 43° 15′ n. lat., and 0° 50′ to 2° 30′ w. long. Area about 4,000 sq. miles. Pop. '77, 304,184. The country is mountainous, being bounded and traversed by the Pyrenees, spurs of which occupy almost the whole of the province in its northern and eastern parts. The highest peaks are Altovisear, Adi, Alcorrunz, and Ruña. Navarre is watered by the Bidassoa, the Anezo, and by the Ebro, together with its tributaries, the Ega and Aragon, on the level shores of which corn, wine, and oil of good quality are

produced. Some of the valleys which intersect the mountain-ranges, as those of Roncesvalles, Lescon, Bastan, and Roncal, have a fruitful soil, and yield good crops; but in the mountain districts, husbandry is impracticable, and the inhabitants nearly all follow the chase, as much from necessity as inclination; and while a large number of the Navarrese are soldiers, a still larger proportion are smugglers—the proximity of the province to France, and the dangerous character of the almost inaccessible mountain-passes which alone connect the two countries, holding out many inducements and facilities in the way of smuggling. The mountain forests still harbor bears, wolves, wild-cats, goats, deer, and an abundance of game of every other kind. Iron and salt are the chief mineral products of the district, but these are obtained in sufficient quantities to be exported. The people of Navarre are a hardy, brave, and hospitable race, loyal to the sovereign, attentive observers of the forms of their religion, and, except in the matter of smuggling, honest and moral; but they are passionate and distrustful, prone to anger, and keen in avenging an insult, real or imaginary. Although not industrious, the people follow a few branches of industry, and manufacture glass, leather, soap, chocolate, etc., of good quality.

The Navarrese, with few exceptions, are members of the church of Rome, to whose tenets they cling with superstitious devotion. They have always intermarried chiefly among their own compatriots, and are a nearly pure Basque race. In the mountainous districts, Basque is still spoken, but in the plains, the modern Castilian form of Spanish is rapidly supplanting the ancient language of the country. The chief town is Pamplona (q.v.).

The territory known from an early period of Spanish history under the name of Navarre, was occupied in ancient times by the Vascones, who were subdued by the Goths in the 5th century. After having become gradually amalgamated with their conquerors, the people continued to enjoy a species of turbulent independence under military leaders until the 8th c., when they were almost annihilated by the hordes of Arabs who were rapidly spreading their dominion to all parts of the peninsula. The Gothic Vascones of Navarre, who had been converted to Christianity, offered a gallant resistance to their infidel invaders, and although repeatedly beaten, they were not wholly subdued. The remnant which escaped the sword of their Moslem enemies took refuge in the fastnesses of the mountains, and choosing a knight of their number, Garcia Ximenes, as their leader or king, they sallied forth, and by their gallant resistance, compelled the Arabs to leave them in the enjoyment of an independence greater than that of the neighboring states. On the extinction of the race of Ximenes, in the middle of the 9th c., the Navarrese elected as their king Inigo Sanchez, count of Bigorre, in whose family the succession remained till the marriage of Philip the fair with queen Joanna I. of Navarre; and the accession of the former to the throne of France in 1285, rendered Navarre an appanage of the crown of France. It continued a part of that kingdom during the successive reigns of Louis X., Philip V., and Charles the fair, but on the death of this last in 1328, France fell to the family of Valois, and the daughter of Louis X., the rightful heir, succeeded to Navarre as Joanna II. The events of the kingdom present no features of interest during the next hundred years. The marriage of Blanche, daughter of Charles III. of Navarre, with John II. of Aragon, in 1442, did not produce an annexation of Navarre to Aragon, as John suffered his wife to rule her own kingdom as she pleased, and even after her death and his subsequent re-marriage, he resigned the government entirely to his son by Blanche. This son, known as Charles, prince of Viano, having attempted to remain neutral in his father's quarrels with Castile, John expelled him and his elder sister Blanche, who sided with him, from Navarre, and conferred the kingdom on Leonora countess de Foix, his younger daughter, by Blanche, whose misrule completed the disorganization which these family quarrels had commenced. Her son, Francis, called Phœbus, from his beauty, succeeded in 1479, and his sister Catharine in 1483. Ferdinand and Isabella sought to marry the young queen to their son and heir, the prince of Asturias, but her mother, a French princess, married her to Jean d'Albret. Ferdinand, however, was not willing to let the prize escape him, and on some slight pretext he seized Navarre in 1512. After this act of spoliation, there remained nothing of ancient Navarre beyond a small territory on the northern side of the Pyrenees, which was subsequently united to the crown of France by Henri IV. of Bourbon, king of Navarre, whose mother, Jeanne d'Albret, was granddaughter of queen Catharine; and hence the history of Navarre ends with his accession to the French throne in 1589. The Navarrese were, however, permitted to retain many of their ancient privileges, after their incorporation with the other domains of the Spanish crown, until the reign of queen Isabella II., when the active aid which they furnished to the pretender, Don Carlos, in the rebellion of 1834–39, led to the abrogation of their *fueros*, or national assemblies, and to the amalgamation of their nationality with that of the kingdom at large. In the later Carlist struggle of 1872–76, Navarre was again a principal seat of the war, the inhabitants being stimulated in their assistance of the representative of the claims and title of Don Carlos by his promise of restoring their *fueros*.

NAVARRETE, Domingo Fernandez de, 1610–89; b. Spain; was educated at Valladolid as a Dominican, and in 1647 went on a mission to the Philippine islands, where he soon became professor of theology in the college of Manilla. A few years later, however,

he went to China and busied himself in the interior of the country, studying the people and their language until he was persecuted and thrown into prison in Canton. As soon as he escaped and arrived in Europe he visited Rome, and complained to the pope of the work of the Jesuits in China, accusing them of accommodating their religion to the superstition of the natives. He then returned to Spain and published a large work on the *History, Politics, Ethics, and Religion of the Chinese Monarchy*, shortly after which he received the appointment of archbishop of San Domingo in the West Indies, where he passed the remainder of his life.

NAVARRETE, Martino Fernandez de, 1765–1844; b. Spain; entered the Spanish navy in 1780, was present at the attack on Gibraltar in 1782, and afterwards served against the Moors and Algerines. Ill health, however, forced him to retire from the service for some years which he spent in collecting documents respecting the history of Spanish maritime discovery, labors that resulted in 1825 in the publication of the first and second volumes of a work by him entitled *Colleccion de los Viages y Descubrimientos que hicieron por mar los Españoles desde fines del Siglo XV.*, which was pronounced by Humboldt to be "one of the most important historical monuments of modern times." In 1829 the third volume appeared; and eight years later, the fourth and fifth volumes. But before the sixth and seventh were completed the author died. He was the author of several other lesser works, and a distinguished member of the Spanish academy.

NAVAR'RO, a co. in n.e. Texas, on the Trinity river; 1040 sq.m.; pop. '80, 21,705 —5,304 colored. The surface is undulating with a large proportion of prairie. The chief productions are corn, cotton, and sweet potatoes. Cattle and pork are raised. It is drained by Chambers and Richland creeks, and is on the Houston and Texas Central railroad. Co. seat, Corsicana.

NAVE. See Church.

NA'VESINK (or Neversink) HIGHLANDS, a chain of hills that form a bold headland along the coast of New Jersey on the border of Monmouth county. To ships approaching New York, they are important landmarks and located on them are two first-class light-houses 53 ft. high, both of which show fixed white lights. Though the neighboring region is a beautiful one and only 20 m. from New York, it remains primitive and sparsely inhabited. It is now, however, coming into notice and drawing visitors.

NA'VEW (Fr. *navette*), a garden vegetable much cultivated in France and other parts of the continent of Europe, although little used in Britain. It is by some botanists regarded as a cultivated variety of *Brassica napus*, or rape (q.v.), whilst others refer it to *B. campestris*, sometimes called wild navew, the species which is also supposed to be the original of the Swedish turnip (q.v.). The part used is the swollen root, which is rather like a carrot in shape. Its color is white. Its flavor is much stronger than that of the turnip. It succeeds best in a dry light soil. The seed is sown in spring, and the plants thinned out to 5 in. apart.

NAVEZ, François Joseph, 1787–1869; b. Belgium; studied art in Brussels and Ghent; and in Paris was a pupil of the great painter David. After finishing his studies he resided in Brussels till his death, and became director of the fine arts academy. His works almost all represent biblical scenes such as: "The Prophet Samuel," "The Ascension of the Virgin," "Hagar in the Desert," and "Meeting of Isaac and Rebecca."

NAVIC'ULA (Lat. a little ship), a genus of *Diatomaceæ* (q.v.), receiving its name from the resemblance of its form to that of a boat. Some of the species are very common.

NAVIC'ULAR DISEASE, in the horse, consists in strain of the strong flexor tendon of the foot, at the point within the hollow of the fetlock, where it passes over the navicular bone. It is most common amongst the lighter sorts of horses, and especially where they have upright pasterns, out-turned toes, and early severe work on hard roads. It soon gives rise to a short tripping yet cautious gait, undue wear of the toe of the shoe, wasting of the muscles of the shoulder, and projecting or "pointing" of the affected limb whilst standing. When early noticed, and in horses with well-formed legs, it is often curable; but when of several weeks standing, it leads to so much inflammation and destruction of the tendon and adjoining parts, that soundness and fitness for fast work are again impossible. Rest should at once be given, the shoe removed, the toe shortened, and the foot placed in a large, soft, hot poultice, changed every few hours. Laxative medicine and bran mashes should be ordered, and a soft bed made with old short litter. After a few days, and when the heat and tenderness abate, cold applications should supersede the hot; and, after another week, a blister may be applied round the coronet, and the animal placed for two months in a good yard or in a grass field, if the ground be soft and moist; or, if sufficiently strong, at slow farm-work on soft land. Division of the nerve going to the foot removes sensation, and consequently lameness; and hence is useful in relieving animals intended for breeding purposes or for slow work. The operation, however, is not to be recommended where fast work is required; for the animal, insensible to pain, uses the limb as if nothing were amiss, and the disease rapidly becomes worse.

NAVIES, Ancient and Mediæval. The ancient method of naval warfare consisted in great part, in the driving of *beaked* vessels against each other: and therefore skill and celerity in maneuvering, so as to strike the enemy at the greatest disadvantage, were of the utmost importance. The victory thus usually remained with the best sailor. This mode of conflict has been attempted to be revived at the present time, and vessels called "steam-rams" are specially constructed for this species of conflict. The earliest powers having efficient fleets appear to have been the Phenicians, Carthaginians, Persians, and Greeks; the Greeks had fleets as early as the beginning of the 7th c. B.C.—the first sea-fight on record being that between the Corinthians and their colonists of Corcyra, 664 B.C. The earliest great battle in which tactics appear to have distinctly been opposed to superior force, and with success, was that of Salamis (480 B.C.), where Themistocles taking advantage of the narrows, forced the Persian fleet of Xerxes to combat in such a manner, that their line of battle but little exceeded in length the line of the much inferior Athenian fleet. The Peloponnesian war, where "Greek met Greek," tended much to develop the art of naval warfare. But the destruction of the Athenian marine power in the Syracusan expedition of 414 B.C., left Carthage mistress of the Mediterranean. The Roman power, however, gradually asserted itself, and after two centuries, became omnipotent by the destruction of Carthage. For several following centuries, the only sea-fights were occasioned by the civil wars of the Romans. Towards the close of the empire, the system of fighting with pointed prows had been discontinued in favor of that which had always co-existed—viz., the running alongside, and boarding by armed men, with whom each vessel was overloaded. Onagers, balistæ, etc., were ultimately carried in the ships, and used as artillery; but they were little relied on, and it was usual, after a discharge of arrows and javelins, to come to close quarters. A sea fight was therefore a hand-to-hand struggle on a floating base, in which the vanquished were almost certainly drowned or slain.

The northern invaders of the empire, and subsequently the Moors, seem to have introduced swift-sailing galleys, warring in small squadrons and singly, and ravaging all civilized coasts for plunder and slaves. This—the break-up of the empire—was the era of piracy, when every nation, which had more to win than lose by freebooting, sent out its cruisers. Foremost for daring and seamanship were the Norsemen, who penetrated in every direction from the Bosporus to Newfoundland. Combination being the only security against these marauders, the mediæval navies gradually sprang up; the most conspicuous being—in the Mediterranean, those of Venice, Genoa, Pisa, Aragon; on the Atlantic sea-board, England and France. In the Mediterranean, Venice, after a long struggle with the Genoese, and subsequently with the Turks, became the great naval power. The Aragonese fleet gradually developed into the Spanish navy, which, by the epoch of Columbus, had a rival in that of Portugal. Many struggles left, in the 16th and 17th centuries, the principal naval power in the hands of the English, French, Dutch, Spaniards, and Portuguese. The present state of these and other existing navies will be briefly given under Navies, Modern.

NAVIES, Modern. Dating the modern navies of the world from the 16th century, we find the British navy rising from insignificance by the destruction of the Spanish armada in 1588; a blow from which Spain never recovered, and which the Dutch, whose naval force had acquired tremendous strength in their struggle for independence, increased the weight of, by their triumph in 1607, in the bay of Gibraltar. At this time there was no decisive superiority of the fleet of England over that of France; but each was inferior to the Dutch navy. The commonwealth and reign of Charles II. were signalized by the struggle for mastery between the English and Dutch; when victory, after many alternations, finally sided with the former. Through the 18th century, the English and French were the principal fleets; but Louis XVI. gave a decided superiority to the navy of France; and at the period of the American war, the naval power of England was seriously threatened. Spain, Holland, and Russia (now for the first time a naval power) had meanwhile acquired considerable fleets; and the "armed neutrality," to which the northern powers gave their adherence rendered the British position most critical. However, the slowly roused energy of her government, the invincible courage of her seamen, and the genius of her admirals brought Britain through all her trials. Camperdown broke the Dutch power; many battles weakened the French navy; and at Trafalgar in 1805, it, with the Spanish power, was swept from the ocean. The United States had in the meantime augmented their fleet, and in the war of 1812–14 maintained a glorious struggle. During the American war of secession many gun-boats, "monitors," and iron-clads of all classes were created; but chiefly adapted for river and coast service. The growth, in recent times, of the British navy will be found under Navy, British. The emperor Napoleon III. greatly enlarged and improved the French navy, yet in the war of 1870–71 it had no opportunity of proving its effectiveness.

The contest between the attack and defense which has been going on for some time appears to have attained its limits in the 100-ton guns of the Italian navy, and the 24-inch armor-plate of the British; and a new departure seems already to have been taken which points in the direction of steel plates and speed, and a more special adaptation of ships for particular services. The torpedo system has introduced a new element into naval warfare, particularly in harbors, rivers, and inland waters, which can hardly be

said to be yet fully developed (see TORPEDO); and the catastrophes of the *Vanguard* of the British navy, and the *Grosser Kurfürst* of the German, have pointed out dangers connected with the ram system that had not been calculated upon.

The following table gives a fair estimate of the comparative strength of the chief navies of the world. Comparison by the number of guns is of little account now; that of *armored steamers* and *horse-power* is more to the point:

CHIEF NAVIES OF THE WORLD, 1884.

Country.	Armored Steamers.	Unarmored Steamers.	Sailing Vessels.	Total Ships.	Guns.	Men.	Annual Cost.
Austria-Hungary	14	37	10	61	314	6,180	£871,000
Brazil	18	39	.....	57	188	4,200	1.900.000
Denmark	8	25	.....	33	240	1,125	290,000
France	59	326	113	498	2,854	70,683	8,500,000
Germany	22	59	4	85	517	14,155	2,000,000
Great Britain	72	360	120	552	440*	76,000	10,643,000
Greece	2	12	.....	14	4	653	75,400
Italy	18	70	.....	88	684	16,000	1,770,000
Netherlands	17	48	20	85	524	10,000	1,090,000
Portugal	1	23	18	42	178	3,530	359,000
Russia	29	359	.....	389	836	30;194	3,900,000
Spain	10	71	8	89	922	15,648	1,230,000
Sweden and Norway	18	51	171	246	521	.....	400,000
Turkey	33	45	.....	78	.....	23,000	530,000
United States	24	64	5	93	823	8,250	2,707,400

* Guns of armored steamers only are given.

NAVIES, MODERN (*ante*). See UNITED STATES NAVY.

NAVIGATION, ART OF. We shall give a few indications of the manner of conducting the course of a ship at sea, referring to the various headings, such as SEXTANT, LATITUDE and LONGITUDE, GREAT-CIRCLE SAILING, etc., for the more scientific explanation of the operations in use for determining position.

A vessel having completed her lading, she is steered out of port by a pilot, who lays his course by the *ranges* with which long familiarity has made him acquainted. Arrived off soundings, or at a point where his local knowledge is no longer of value, he leaves the vessel to the captain, who then assumes all responsibility. While off the coast the captain steers by his *chart* and by the *lead*, assisted by *landmarks* and *buoys* by day, and by *lights* at night. It is his duty, without waiting for foggy weather, nor for any doubt of his situation, to keep the lead going, and a careful watch, while on soundings. When, finally, he is about to lose sight of the coast, he determines a last position, called the *point* of *departure*, which serves as the base of his reckoning, The problems involved in a long voyage are many, some intricate, but position is always ascertainable, either by *observations* or *dead reckoning*. Two things must be known, *speed* and *direction*. The first is found by the *log*, whose unit, the *knot*, predicates the number of nautical *miles*, 1851.85 meters, traversed per *hour*. The second is indicated by the *compass*, from which is read the angle, known as the *course*, between the magnetic meridian and the axis of the keel. But to reduce this to the true course with reference to the terrestrial meridian, the magnetic *variation* must be known and applied. The log is not an accurate instrument, nor is it possible, in a sailing vessel, to throw it as often as slight changes in the rate of motion occur; besides, it seldom happens that the course of a vessel is exactly that read from the compass, for decomposing into two forces the normal line of action of the wind on the sails, there results a certain side-push, forming an angle with the keel, and resulting in a falling-off from the true course known as *drift*. Allowance must also be made for the influence of local, tidal, or ocean currents, the force of which, even where not known by experience nor laid down on the chart, must be carefully judged, and anxiously watched for. The amount of drift is ascertained from the *wake*, either by a back-sight of the compass, or by means of a quadrant and eye-pieces, and can be always combined with the magnetic variation to obtain the true course. Then make allowance for the *set* of the current, the effect on a course of given length and direction of the known speed and trend of the stream.

When, as is necessary every day, it is desired to follow a *rhumb-line*, the course is deduced by making allowance inversely for variation, drift, and set. This course the captain lays down, and the officer of the deck continually oversees the steersman, so that, granting this course continually kept, the path of the vessel successively intersects each meridian at the same angle, called the *angle* of *rhumb*, and this line, a curve of double flexure, is the *loxodrome*, or *loxodromic line*. But for a vessel to sail directly from point of departure to destination is almost impossible, whether from baffling winds, intervening coasts, or adverse currents; the best that can be done then is to substitute a series of loxodromic curves, as little removed from the true course as possible, to make as few and as advantageous stretches as possible, and to take advantage of known currents and

* The horse-power and guns of the armored steamers only are given. The number of men includes the royal naval reserve.

favorable winds to substitute for a short but questionable passage a more circuitous but quicker route. The log must always be thrown whenever wind, sails, or course may change; the course and the speed are noted, say every half-hour, on a tally, and at the end of each watch the course is transferred to the *log-book*. Finally, every day at noon, or oftener as advisable, the reckoning is cast up, and the position of the vessel marked on the chart, taking as point of departure the last calculated position. The future course is deduced from this. All navigation by reckoning should be checked at least once a day, and as often and in as many different ways as can be accomplished by observations, repeated if possible, and the mean taken.

NAVIGATION, FREEDOM OF, in the open or high seas has been fully established for nearly a century, and such efforts as have been made in the past to claim exclusive jurisdiction were founded rather on national pride or arrogance than on reasonable principles or considerations of commercial value. The most pretentious claims which have been made were those of Spain and Portugal in the 15th c. based on bulls of popes Nicholas V. and Alexander VI., giving Portugal control over the African seas, and dividing between the two the sovereignty of the Pacific. Of course Protestant nations paid no attention to these claims. The true principles of sovereignty in regard to seas, bays, etc., were first laid down by Grotius in his *Mare Liberum*, 1608, but, notwithstanding, his countrymen the Dutch for a long time opposed the right of the Spaniards to trade with the Philippines *via* the cape of Good Hope. In 1635 Selden published *Mare Clausum*, an attempt to refute Grotius and defend the claims of the English to sovereignty over the seas about the United Kingdom as far as to the coasts of other nations. His argument was weak, being based entirely on alleged precedents. The latest serious claim of the kind was that of Russia, which formerly asserted dominion over the Pacific n. of 51° n. lat. on the ground that no other state possessed territory bordering thereon. This was withdrawn in treaties with the United States and Great Britain in 1824–25. But while the open sea is free to all, inland seas are subject to the jurisdiction of the country in which they are situated; and where, as in the Black sea, two nations border on an inland sea, and in the case of gulfs or straits, questions of some difficulty have arisen. It is conceded that marine jurisdiction extends a short way from the coast, a marine league being the generally accepted limit; so also, gulfs and bays belong to the countries owning the promontories between which they lie. But this doctrine must not be carried too far, and the idea suggested by chancellor Kent in the early part of this century, that sovereignty might be in future claimed over the waters inclosed by lines drawn from cape Cod to cape Ann, Nantucket to Montauk Point, thence to the Delaware capes and from the extremity of Florida to the Mississippi (before Texas was annexed), is now considered untenable, as is also the proposition that the line of the gulf stream should bound the sovereignty of the United States. For purposes connected with the laws of revenue and commerce, four leagues are allowed. As to narrow seas, gulfs, and straits, there has existed from time immemorial a claim on the part of England to sovereignty over the English and St. George's channels, the Irish sea and the North channel, and theoretically it may still exist; but long since the only exactions from other nations have been in requiring certain honors to be paid to the British flag, and even this custom has fallen into disuse. Over the Baltic sea Denmark long exercised a rather despotic rule, based partly on the natural position of the sea, partly on precedent, and partly on the cost of maintaining light-houses and signals. Heavy tolls were laid on foreign vessels, and caused the war with the Netherlands in the 17th century. In 1857 the powers agreed to pay Denmark a round sum as compensation for the renunciation of her alleged sovereignty, and the United States paid nearly $400,000 as its share. The questions in regard to the Black sea have had great prominence in the European and Turkish complications of this century. Previous to 1829 Turkey claimed the sole sovereignty. At that date Russia and her allies were admitted to the right of navigation. In 1841 it was agreed that vessels of war should not enter the Bosporus or Dardanelles; while by the treaty of 1856 the Black sea was made neutral, ships of war still being prohibited from entrance, though Russia and Turkey were to allow each other a small naval force for protection of commerce, etc. The action of the Berlin congress of 1878 tends to confirm and strengthen the neutrality of this inland sea. Navigation of rivers has also given rise to questions of international interest, and there has been a constantly increasing freedom and enlargement of the privileges allowed by the country controlling the mouth and lower course to the countries lying above.

NAVIGA'TION, HISTORY OF. In its widest sense, this subject is divisible into three sections—the history of the progressive improvement in the construction of ships, the history of the growth of naval powers, and the history of the gradual spread and increase of the science of navigation. Although these three sections are to some extent interwoven, the present article will be limited to a consideration of the last, the first two being sufficiently described under SHIP-BUILDING and NAVIES.

The first use of ships, as distinguished from boats, appears to have been by the early Egyptians, who are believed to have reached the western coast of India, besides navigating the Mediterranean. Little, however, is known of their prowess on the waves; and, whatever it may have been, they were soon eclipsed by the citizens of Tyre, who, to

make amends for the unproductiveness of their strip of territory, laid the seas under tribute, and made their city the great emporium of eastern and European trade. They spread their merchant fleets throughout the Mediterranean, navigated Solomon's squadrons to the Persian gulf and Indian ocean, and planted colonies everywhere. Principal among these colonies was Carthage, which soon outshone the parent state in its maritime daring. The Carthaginian fleets passed the pillars of Hercules, and, with no better guide than the stars, are believed to have spread northward to the British isles, and southward for some distance along the w. coast of Africa. From the 6th to the 4th centuries B.C., the Greek states gradually developed the art of navigation, and at the time of the Peloponnesian war, the Athenians appear to have been skillful tacticians, capable of concerted maneuvers. The Greeks, however, were rather warlike than commercial in their nautical affairs. In the 4th c. B.C., Alexander destroyed the Tyrian power, transferring its commerce to Alexandria, which, having an admirable harbor, became the center of trade for the ancient world, and far surpassed in the magnitude of its marine transactions any city which had yet existed. Rome next wrested from Carthage its naval power, and took its vast trade into the hands of the Italian sailors. After the battle of Actium, Egypt became a Roman province, and Augustus was master of the enormous commerce both of the Roman and the Alexandrian merchants. During all this period, the size of the vessels had been continually increasing, but probably the form was that of the galley, still common in the Mediterranean, though a more clumsy craft then than now. Sails were known, and some knowledge was evinced even of beating up against a foul wind; but oars were the great motive-power; speed was not thought of, a voyage from the Levant to Italy being the work of a season; and so little confidence had the sailors in their skill or in the stability of their ships (still steered by two oars projecting from the stern), that it was customary to haul the vessels up on shore when winter set in. During the empire, no great progress seems to have been made, except in the size of the vessels; but regular fleets were maintained, both in the Mediterranean and on the coast of Gaul, for the protection of commerce. Meanwhile the barbarian nations of the north were advancing in quite a different school. The Saxon, Jutish, and Norse prows began to roam the ocean in every direction; in small vessels they trusted more to the winds than to oars, and, sailing singly, gradually acquired that hardihood and daring which ultimately rendered them masters of the sea. The Britons were no mean seamen, and when Carausius assumed the purple in their island, he was able, for several years, by his fleets alone to maintain his independence against all the power of Rome.

The art of navigation became almost extinct in the Mediterranean with the fall of the empire; but the barbarous conquerors soon perceived its value, and revived its practice with the addition of new inventions suggested by their own energy. The islanders of Venice, the Genoese, and the Pisans, were the carriers of that great inland sea. Their merchants traded to the furthest Indies, and their markets became the exchanges for the produce of the world. Vast fleets of merchant galleys from these flourishing republics dared the storm, while their constant rivalries gave occasion for the growth of naval tactics. So rich a commerce tempted piracy, and the Moorish corsairs penetrated everywhere on both sides of the straits of Gibraltar in quest of prey; evincing not less skill and nautical audacity than savage fury and inhuman cruelty. But the Atlantic powers, taught in stormy seas, were rearing a naval might that should outrival all other pretenders. The Norsemen extended their voyages to Iceland, Greenland, and Newfoundland, while they first ravaged and then colonized the coasts of Britain, France, and Sicily. The sea had no terrors for these hardy rovers; their exploits are imperishably recorded in the Icelandic sagas, and in the numerous islands and promontories to which they have given names.

Early in the 15th c. the introduction of the mariner's compass rendered the seaman independent of sun and stars—an incalculable gain, as was soon shown in the ocean-voyages of Columbus, Cabot, and others. In 1492 Columbus rendered navigation more secure by the discovery of the variation of the compass. Between that and 1514 the "cross-staff" began to be used; a rude instrument for ascertaining the angle between the moon and a fixed star, with the consequent longitude. Early in the 16th c., tables of declination and ascension became common. In 1537 Nuñez (Nonius), a Portuguese, invented various methods of computing the rhumb-lines and sailing on the great circle. In 1545 the two first treatises on systematic navigation appeared in Spain, one by Pedro de Medina, the other by Martin Cortes. These works were speedily translated into French, Dutch, English, etc., and for many years served as the text-books of practical navigation. Towards the end of the century, Bourne in England, and Stevin in Holland, improved the astronomical portion of the art, while the introduction of time-pieces and the log (q.v.) rendered the computation of distance more easy.

It would be tedious to enumerate the successive improvements by which the science of navigation has been brought to its present high perfection; but as conspicuous points in the history of the art, the following stand out: The invention of Mercator's chart in 1569; the formation by Wright of tables of meridional parts, 1597; Davis's quadrant, about 1600; the application of logarithms to nautical calculations, 1620, by Edmund Gunter; the introduction of middle-latitude sailing in 1623; the measure of a degree on the meridian, by Richard Norwood, in 1631. Hadley's quadrant, a century later, rendered observations easier and more accurate; while Harrison's chronometers (1764),

rendered the computation of longitude a matter of comparatively small difficulty. Wright, Bond, and Norwood were the authors of scientific navigation, and their science is now made available in practice by means of the *Nautical Almanac*, published annually by the British admiralty. The more important points of the science of navigation are noticed under such heads as DEAD-RECKONING, LATITUDE AND LONGITUDE, GREAT-CIRCLE SAILING, SAILINGS, etc.

NAVIGATION, INLAND. See page 887.

NAVIGATION, LAWS AS TO. By the law of nature and of nations, the navigation of the open sea is free to all the world. The open sea means all the main seas and oceans beyond 3 m. from land. The sea within 3 m. from land is called the territorial sea, and each state has a kind of property in such sea, and has a right to regulate the use thereof. Hence, it was natural that in early times, before the laws of commerce were properly understood, each state should endeavor to exclude foreigners from that part of the sea so as to secure to its own subjects the benefits of the carriage of goods in ships, which has always been an increasing source of wealth. In England, however, as in most countries, the first care seems to have been bestowed on the navy, as the great means of defending the realm against enemies, and trading-ships came to be first subject to statutory regulation only as being in some way ancillary to the interests of the navy. The laws of Oleron were the first code of maritime laws which obtained notice as well as general acceptance in Europe, in the time of Edward I., and the authorship of those laws is claimed by Selden and Blackstone for Edward I., though the point is disputed by the French writers. By a statute of Richard II., in order to augment the navy of England, it was ordained that none of the lieges should ship any merchandise out of the realm except in native ships, though the statute was soon varied and seldom followed. At length, in 1650, an act was passed with a view to stop the gainful trade of the Dutch. It prohibited all ships of foreign nations from trading with any English plantation without a license from the council of state. In 1651 the prohibition was extended to the mother-country, and no goods were suffered to be imported into England or any of its dependencies in any other than English bottoms, or in the ships of that European nation of which the merchandise was the genuine growth or manufacture. At the restoration, these enactments were repeated and continued by the navigation act (12 Chas. II. c. 18), with the further addition, that the master and three-fourths of the mariners should also be British subjects. The object of this act was to encourage British shipping, and was long believed to be wise and salutary. Adam Smith, however, had the sagacity to see that the act was not favorable to foreign commerce or to opulence, and it was only on the ground that defense was more important than opulence, that he said it was "perhaps the wisest of all the commercial regulations of England." In 1826 the statute 4 Geo. IV. c. 41 repealed the navigation act, and established a new system of regulations, which were further varied by subsequent statutes, till, under the influence of the free-trade doctrines, new statutes were passed, which reversed the ancient policy. By the law, as now altered, foreign vessels are allowed free commercial intercourse and equality with the ships of this country and its dependencies, except as regards the coasting trade of the British possessions in Asia, Africa, and America, for the coasting trade of the United Kingdom is now entirely thrown open to all comers. The advantages of equality and free trade are, however, so far qualified, that in the case of the ships of those nations which do not concede to British ships like privileges, prohibitions and restrictions may be imposed by order in council.

As regards those laws of navigation which affect the property and management of ships, a complete code of regulations is contained in the merchant shipping acts, which are 17 and 18 Vict. c. 104, 18 and 19 Vict. c. 91, 25 and 26 Vict. c. 63, 34 and 35 Vict. c. 110, 36 and 37 Vict. c. 85. 1. As to ownership, registration, and transfer of merchant-ships. No ship is deemed a British ship unless she belong wholly to natural born subjects, denizens, naturalized persons, or bodies corporate, having a place of business in the United Kingdom or some British possession. Every British ship, with a few exceptions as to old ships and small vessels, must be registered, otherwise, it is not entitled to the protection of the British flag. The commissioners of customs indicate at what port in the United Kingdom ships may be registered by their officers, and when registered, the ship is held to belong to that port. The name of the ship and its owners must be stated; and as regards joint-ownership, a ship is capable only of being subdivided into 64 shares, and not more than 32 owners shall own one ship. These registered owners are deemed the legal owners, and so long as the register is unchanged, the ship is held still to belong to them. The only way of transferring the property is by bill of sale under seal; or if a mortgage is made, it must be made in a particular form, and duly registered, and the priority of title as between several mortgages is regulated by the date of the entry in the register. 2. As regards the laws concerning merchant seamen, there is established in every such seaport a superintendent, whose business it is to afford facilities for engaging seamen, by keeping registers of seamen and superintending the making and discharging of contracts. No person is allowed to be employed in a foreign-going ship as master, or as first, or second, or only mate, or in a home-trade passenger-ship as master, or first or only mate, unless he has a certificate of competency or a certificate of service, issued by the board of trade only to those who are deemed entitled

thereto. The master of every ship above 80 tons burden shall enter into an agreement, of a certain form, with every seamen he carries from the United Kingdom, and in which the names of the seamen, wages, provisions, capacity of service, etc., are set forth. The seamen are not to lose their wages though no freight is earned, or the ship lost. The men are also to have a berth of a certain size, and the ship to be supplied with medicines, log-book, etc. In order to secure general information, every master of a foreign-going ship is bound, within 48 hours after arriving at the final port of destination in the United Kingdom, to report his ship. Unseaworthy or over-loaded ships may be surveyed by the board of trade, and detained, 3. As regards the liability of ship-owners for loss or damage, it is provided by statute, that no owner of a sea-going ship shall be liable to make good any loss or damage occurring without his actual fault or privity, to goods or things on board, by reason of fire on board the ship; or to any gold, silver, diamonds, watches, jewels, or precious stones on board, by reason of robbery or embezzlement, unless the true nature and value of such articles have been inserted in the bill of lading. And in cases where loss to goods occurs without his actual fault or privity, the owner shall not be liable in damages to an aggregate amount exceeding £8 per ton of the ship's tonnage. In case of loss of life or personal injury caused by mismanagement of the ship, but without the actual fault or privity of the owners, they shall not be liable beyond £15 per ton. In case of accidents, whereby a large number of persons have been killed or injured, and to prevent a multiplicity of actions, the sheriff of the county is to impanel a jury, and inquire into the question of liability. If the owners are found liable, then £30 is to be assessed as the damages for each case of death or personal injury. In case of death, such sum is to be paid to the husband, wife, parent, or child of the deceased. If any person consider this is not sufficient damages, then, on returning such sum, he may commence an action; but unless he recover double that sum, he must pay costs. See also PILOTS and LIGHT-HOUSES.

NAVIGATION LAWS (*ante*). In regard to United States laws of navigation affecting the property in and management of ships, see SHIPPING, LAW OF. Only the regulation of congress in regard to the motions of ships coming near each other in such a way as to make a collision possible will be here considered. These regulations, which will be carried into effect in the courts of the United States, are also enforced in most commercial countries; and have taken the place of the general rules of the maritime law. They are the same which were adopted by France and Great Britain in 1863, and have since been agreed to by the United States and Canada, the chief continental commercial powers, Brazil, and the South American republics. Every steamship under sail and not under steam is to be considered a sailing-ship; and every steamship under steam, whether under sail or not, is to be considered a ship under steam. Every steam vessel under way must carry at the foremast head a white light; on the port side a red light; on the starboard side a green light; and both the green and red side-lights are to be fitted with inboard screens so as to keep the lights from being seen across the bow. Steamships towing other ships must carry two bright white lights vertically beside their side-lights to prevent them from being confounded with other steamships. Sailing-ships under way, or being towed, carry the same lights as steamships, with the exception of mast-head lights. Both steamships and sailing-vessels, when at anchor in roadsteads, shall exhibit a white light. Sailing pilot-vessels carry a white light at the mast-head, and show a flare-up light every 15 minutes. In case of a fog signals are to be sounded at least every 5 minutes. Steamships and sailing-vessels not under way sound a bell. Steamships under way sound a steam-whistle. Sailing vessels under way sound a fog-horn. A steamship coming near enough to a ship to make collision probable must stop and reverse. If two ships under steam are crossing each other, the ship which has the other on her starboard side must keep out of the other's way. If two sailing-ships meet end on so as to hazard collision the helms of both shall be put to port; and so with steamships. A vessel overtaking another must keep out of the latter's way. If two sailing-ships cross each other with the wind on different sides the one with the wind on the port side must keep out of the way of the one with the wind on the starboard side; but if they have the wind on the same side, or one has the wind aft, the one to windward must keep out of way of the one to leeward.

NAVIGATION, OCEAN STEAM. See STEAM NAVIGATION.

NAVIGA'TORS' or **SAMO'AN ISLANDS**, a group of nine islands, with some islets, in the Pacific ocean, lying n. of the Friendly islands, in lat. 13° 30′ to 14° 30′ s. and long. 168° to 173° west. The four principal islands of the group are Mauna, Tutuila, Upolu, and Savaii. Of these, Savaii, 40 m. in length by 20 m. broad, and having a population of 20,000, is the largest. Area of the group estimated at 2,650 sq.m.; pop. about 56,000. With the exception of one (Rose island), the Navigators' islands are all of volcanic origin. For the most part they are lofty, and broken and rugged in appearance, rising in some cases to upwards of 2,500 ft. in height, and covered with the richest vegetation. The soil, formed chiefly by the decomposition of volcanic rock, is rich, and the climate is moist. The forests, which include the bread-fruit, the cocoanut, banana, and palm trees, are remarkably thick. The orange, lemon, tacca (from which a kind of sago is made), coffee, sweet-potatoes, pine-apples, yams, nutmeg, wild sugar-cane, and many other important plants, grow luxuriantly. Until recently, when swine, horned-cattle, and

Tompion. 9. Bar-shot. 10. Shrapnel for ship-gun. 11. Ball-carriage for 96-pounder. 12. Cross-section of shell. 13. Breech-hammer and lanyard of gun. 14. Shell for 96-pounder. 15. Powder-box. 16. Percussion-shell.

horses were introduced, there were no traces among these islands of any native mammalia, except a species of bat. The natives are well-formed (especially the males), ingenious, and affectionate. The women, who superintend the indoor work and manufacture mats, are held in high respect. There are English and American mission-stations on the islands, as well as several Roman Catholic establishments, and many of the natives have embraced Christianity. The government is in the hands of the hereditary chiefs. In 1875 col. Steinberger, from the United States, established himself as (virtually) dictator of the Navigators' islands; but was removed by the commander of a British war-vessel in 1876. Trade is carried on with Sydney.

NAVY, British. Owing to the insular position of Great Britain her navy has long been considered a matter of vital importance, and is the service in which every inhabitant takes a peculiar pride. In considering the history of the British navy it is convenient to divide the subject into *matériel* and *personnel*. The latter had no distinct organization till the time of Henry VIII.; but of the former, we recognize in the earliest times the germ of subsequent glories. Carausius, a Roman general, who had thrown off his dependence on the empire, maintained himself in England for several years by his fleet, with which he prevented the imperial forces from reaching the island. The Saxons brought maritime prowess with them to the British shores, but appear soon to have lost it amid the rich provinces in which they settled. Some organization for the defense of the coast was, however, maintained; and Alfred the great availed himself of it to repulse the Danes; he at the same time raised the efficiency of his navy by increasing the size of his galleys, some being built which were capable of being rowed by thirty pair of oars. Under his successors the number of vessels increased, and both Edward and Athelstan fought many naval battles with the Danes. Edgar aspired to be lord of all the northern seas, and had from three to five thousand galleys, divided into three fleets on the western, southern, and eastern coasts respectively; but the size of most of these ships was very insignificant, and the greater part were probably mere row-boats. Ethelred II. formed a sort of naval militia, enacting that every owner of 310 hides of land should build and furnish one vessel for the service of his country.

William the conqueror established the Cinque ports, with important privileges, in return for which they were bound to have at the service of the crown for 15 days in any emergency 52 ships carrying 24 men each. Richard I. took 100 large ships and 50 galleys to Palestine. John claimed the sovereignty of the seas, and required all foreigners to strike to the English flag; a pretension which has been the cause of some bloody battles, but which England proudly upheld in all dangers. (This honor was formally yielded by the Dutch in 1673, and the French in 1704; and, although not now exacted in its fullness, the remembrance of the right survives in requiring foreign vessels to salute *first*). In the same king's reign a great naval engagement with the French took place (1293) in mid-channel, when 250 French vessels were captured. The Edwards and the Henries maintained the glory of the British flag; Edward III., in person, with the Black Prince, at the battle of Sluys, in 1340, defeated a greatly superior French fleet, with 40,000 men on board. Henry V. had "grete shippes, carrakes, barges, and ballyngers;" and at one time collected vessels enough to transport 25,000 men into Normandy. Henry VII. was the first monarch who maintained a fleet during peace; he built the *Great Harry*, which was the earliest war-vessel of any size, and which was burned at Woolwich in 1553.

To Henry VIII., however, belongs the honor of having laid the foundation of the British navy as a distinct service. Besides building several large vessels, of which the *Henry Grace de Dieu*, of 72 guns, 700 men, and probably about 1000 tons, was the most considerable, he constructed a permanent personnel, defining the pay of admirals, vice-admirals, captains, and seamen. He also established royal dockyards at Deptford, Woolwich, and Portsmouth; and for the government of the whole service instituted an admiralty and navy-board, the latter being the forerunner of the present Trinity board. When this king died he left 50 ships of various sizes manned by about 8,000 hands.

Under Edward VI. the navy fell off, but was sufficiently important in the succeeding reign for the English admiral to exact the salute to his flag from Philip II. with a larger Spanish fleet when the latter was on his way to espouse queen Mary. Elizabeth had the struggle with the Spanish armada to try her navy, and left 42 ships, of 17,000 tons in all, and 8,346 men—15 of her ships being upwards of 600 tons. From this period the tonnage of the ships steadily increased. Under James I. and Charles I. Mr. Phineas Pett, M.A., the first scientific naval architect, remodeled the navy, abolishing the lofty forecastles and poops, which had made earlier ships resemble Chinese junks. In 1610 he laid down the *Prince-Royal*, a two-decker, carrying 64 large guns; and in 1637 from Woolwich he launched the celebrated *Sovereign of the Seas*, the first three-decker, and certainly the largest ship hitherto constructed on modern principles. She was 232 feet in length, of 1637 tons, and carried at first 130 pieces of cannon; but being found unwieldy, was cut down, and then proved an excellent ship. She was burned in 1696.

Prince Rupert's devotion to the crown was bad for the navy, for he carried off 25 large ships; and Cromwell, on acceding to power, had but 14 two-deckers. His energy, however, soon wrought a change, and in five years he had 150 ships, of which a third were of the line; his crews amounted to 20,000 men. During the protectorate, Peter

Pett, son of Phineas, built the *Constant Warwick*, the earliest British frigate, from a French design and pattern. Cromwell first laid navy estimates before parliament, and obtained £400,000 a year for the service. The duke of York, afterwards James II., assisted by the indefatigable Mr. Samuel Pepys, did much for the navy, establishing the system of admiralty government much on its present footing. In his time, sir Anthony Deane improved the model of ships of war, again after a French design. James left, in 1688, 108 ships of the line, and 65 other vessels; the total tonnage of the navy, 101,892 tons; the armament, 6,930 guns; and the personnel, 42,000 men. William III. sedulously augmented the force, foreseeing its importance to his adopted country. When he died, there were 272 ships of 159,020 tons, when the annual charge for the navy had risen to £1,056,915. George II. paid much attention to his fleets, and greatly augmented the size of the ships; he left, in 1760, 412 ships of 321,104 tons. By 1782 the navy had risen to 617 sail of 500,000 tons; and by 1802 to 700 sail, of which 148 were of the line. In 1813 there were 1000 ships (256 of the line), measuring about 900,000 tons, and carrying 146,000 seamen and marines, at an annual charge of about £18,000,000. Since the peace in 1815 the number of vessels has been greatly diminished, although their power has vastly increased.

The progressive augmentation of size in vessels may be judged from the increase in first-rates. In 1677 the largest vessel was from 1500 to 1600 tons; by 1720, 1800 had been reached; by 1745, 2,000 tons; 1780, 2,200 tons; 1795, 2,350 tons; 1800, 2,500 tons; 1808, 2,616 tons; 1853, 4,000 tons. From 1841 a gradual substitution of steam for sailing vessels began, which was not completed, however, till 1859. Since 1860 another reconstruction has taken effect, armor-plated frigates, impervious to ordinary shot, armed either as broadside vessels or in turrets, being substituted for timber vessels. At the same time three and two deckers have ceased to be employed, enormous frigates and turret-ships replacing them of a tonnage far exceeding the largest three-deckers of former times; they mount fewer guns, but those they carry are of stupendous caliber, and of rifled bore. The *Northumberland*, one of the largest frigates of this new class, is of 6,621 tons, 1350 horse-power, and 38 large guns, while the *Devastation* carries 4 great guns in turrets of the most massive armor. The *Inflexible* (turret-ship) carries four 81-ton guns, and is supposed to be the most powerful war-ship in the world. See Armor-Plates.

In 1884 the navy contained 62 iron-clads (6 building); 40 composite gun vessels (3 building); 18 iron and steel wood cased corvettes; 6 despatch boats; 36 composite gun boats (2 building); 20 composite sloops; 8 yachts; 3 composite vessels; 53 ships; 9 steam-cruisers (4 building); 9 frigates; 51 gun boats; 9 gun vessels; 23 corvettes (1 building); 5 sloops; 12 vessels; 4 schooners; 5 brigs; 1 torpedo ram; 1 floating battery. Of the iron-clads 22 were turret ships. In addition there were 38 tugs and small vessels employed in the harbor service, and 123 vessels of various classes used as training ships, depots, hospitals, etc. The number of ships in commission was 182, carrying 1211 guns, number of men, 57,250. The annual charge for 1884–85 was estimated at £11,595,711, which may be thus broadly subdivided (excluding medical establishments, medicines, and medical stores, marine divisions, new works, machinery, etc., martial law and law charges):

Wages, victuals, and clothing of officers and men	£3,957,029
Admiralty office	192,970
Coast-guard and naval reserve	196,900
Scientific branch (surveying, hydrography, etc.)	131,600
Dockyards and victualing yards	1,645,170
Stores for building and repairing ships	2,382,000
Miscellaneous services	123,846
Half-pay and pensions	2,072,521
Conveyance of troops	226,300
	£10,928,336

Information on the various points of detail connected with the navy, will be found under the respective heads, as Admiral, Captain, Half-Pay, Ship-Building, Signals, etc.

NAX'OS, the largest, most beautiful, and most fertile of the Cyclades, is situated in the Ægean, midway between the coasts of Greece and Asia Minor. Extreme length, about 20 m.; breadth, 15 miles. Pop. about 12.000. The shores are steep, and the island is traversed by a ridge of mountains, which rise in the highest summit, Dia, upwards of 3,000 feet. The plains and valleys are well watered; the principal products and articles of export are wine, corn, oil, cotton, fruits, and emery. The wine of Naxos (the best variety of which is still called in the islands of the Ægean, *Bacchus-wine*) was famous in ancient as it is in modern times, and on this account the island was celebrated in the legends of Dionysius, and especially in those relating to Ariadne. Among its antiquities are a curious Hellenic tower, and an unfinished colossal figure, 34 ft. long, still lying in an ancient marble quarry in the north of the island, and always called by the natives a figure of Apollo. It was ravaged by the Persians, 490 B.C., and after the conquest of Constantinople by the Latins, became the seat of a dukedom, founded by the Venetians. It now forms a portion of the kingdom of Greece (q.v.). Naxos, the capital, with a popu-

lation of about 5,000, is situated on the n.w. coast, contains 16 Greek and 4 Catholic churches, and 3 convents, and is the seat of a Greek and a Latin bishop.

NAYLOR, JAMES, about 1616–60; b. in Yorkshire, England, of humble parentage. In 1641 he became an adherent of the parliament, and served for about 8 years under Fairfax and Lambert, rising to the rank of quartermaster. The fanatical religious movements of the time seem to have completely overthrown his judgment; he was first a Presbyterian, then an Independent, and in 1651 was led by George Fox to become a Quaker. His ignorant exhortations and frenzied ravings soon caused the main body of Quakers to disown him, but he found a few deluded people who regarded him as an inspired prophet, and followed him from place to place. He suffered and perhaps encouraged these disciples to regard him as a forerunner of Christ, and when he was released from imprisonment at Exeter in 1656, they spread their garments in his path in imitation of the Savior's entrance into Jerusalem. Naylor was at once arrested on charges of blasphemy, tried before parliament, and sentenced to stand in the pillory for two hours, to be whipped at the cart's-tail from Palace-yard to the exchange, the letter B was to be branded on his forehead, and his tongue to be bored by a red-hot iron. After this he was to be taken to Bristol, whipped through that town, and then to be imprisoned for two years. The whole punishment was inflicted. Naylor recanted his errors, and was again received by the society of Quakers. A collection of his writings was published in 1716, and his *Memoirs* in 1719 and reprinted in 1800.

NAZAREANS. See CHRISTIANS OF ST. JOHN.

NAZARENE' (Gr. *Nazarenos* and *Nazaraios*, an "inhabitant of Nazareth"), was used by the Jews as one of the designations of our Lord, and afterward became a common appellation of the early Christians in Judæa. Although, originally, it is but a local appellation, there can be no doubt that as Nazareth was but a second-rate city of the despised province of Galilee, it was eventually applied to our Lord and his followers as a name of contempt (John xviii. 5, 7; Acts xxiv. 5). For the Judaizing sect called Nazarenes, see EBIONITES.

NAZ'ARETH, a small t. or v. of Palestine, anciently in the district of Galilee, and in the territory of the tribe of Zebulon, 21 m. s.e. of Acre. It lies in a hilly tract of country, and is built partly on the sides of some rocky ridges, partly in some of the ravines by which they are seamed. It is celebrated as the scene of the Annunciation, and the place where the Savior spent the greater part of his life in obscure labor. Pop., according to Dr. Robinson, 3,120, of whom 1040 are Greeks, 520 Greek Catholics, 480 Latins, 400 Maronites, and 680 Mohammedans. Porter thinks 4,000 a moderate estimate. In the earliest ages of Christianity, Nazareth was quite overlooked by the church. It did not contain a single Christian resident before the time of Constantine, and the first Christian pilgrimage to it took place in the 6th century. The principal building is the Latin convent, reared, according to pious tradition, on the spot where the angel announced to the Virgin the birth of her Savior-son; but the Greeks have also erected, in another part of Nazareth, a church on the scene of the Annunciation. Besides these rival edifices, the traveler is shown a Latin chapel, affirmed to be built over the "workshop of Joseph;" also the chapel of "the Table of Christ" (*Mensa Christi*), a vaulted chamber containing the veritable table at which our Lord and his disciples used to eat; the synagogue out of which he was thrust by his townsmen; and "the Mount of Precipitation," down which he narrowly escaped being cast headlong. The women of the village have been long famous for their beauty.

NAZ'ARITES (from Heb. *nazar*, to separate), denoted among the Jews those persons, male or female, who had consecrated themselves to God by certain acts of abstinence, which marked them off, or "separated them," from the rest of the community. In particular, they were prohibited from using wine or strong drink of any kind, grapes, whether moist or dry, or from shaving their heads. The law in regard to Nazarites is laid down in the book of Numbers (vi. 1–21). The only examples of the class recorded in Scripture are Samson, Samuel, and John the Baptist, who were devoted from birth to that condition, though the law appears to contemplate temporary and voluntary, rather than perpetual Nazariteship.

NEAGH, LOUGH, the largest lake of the British islands, is situated in the province of Ulster, Ireland, and is surrounded by the counties of Armagh, Tyrone, Londonderry, Antrim, and Down. It is 18 m. (English) in length, and 11 m. in breadth, contains 98,255 acres, is 120 ft. in greatest depth, and is 48 ft. above sea level at low water. It receives the waters of numerous streams, of which the principal are the Upper Bann, the Blackwater, the Moyola, and the Main; and its surplus waters are carried off northward to the north channel by the Lower Bann. Communication by means of canals subsists between the lough and Belfast, Newry, and the Tyrone coal-field. In some portions of the lough the waters show remarkable petrifying qualities, and petrified wood found in its waters is manufactured into hones. The southern shores of the lough are low and marshy, and dreary in appearance. It is well stocked with fish, and its shores are frequented by the swan, heron, bittern, teal, and other water-fowl.

NEAGLE, JOHN, 1799–1865; b. Mass.; began the study of painting as a coachmaker's apprentice, residing in Philadelphia, and at the age of 19 took his first sketches from

life. In 1820 he married the daughter of the painter, Thomas Sully. In 1826 his picture "Patrick Lyon, the Blacksmith" brought him some distinction. He painted the portraits, among other celebrities, of Washington, now in Independence hall, Philadelphia; Gilbert Stuart, Mrs. Wood as *Amina*, Mathew Carey, Henry Clay, Dr. Chapman, and commodore Barron.

NEAL, Alice Bradley. See Haven, Alice Bradley.

NEAL, Daniel, a dissenting minister and author, was b. in London, Dec. 14, 1678. He was educated first at Merchant Taylor's school, and afterwards at Utrecht and Leyden, in Holland, and in 1706 succeeded Dr. Singleton as pastor of a congregation in his native city. Neal's first work was a *History of New England* (1720), which met with a very favorable reception in America. Two years afterwards he published a tract entitled *A Narrative of the Method and Success of Inoculating the Small-pox in New England by Mr. Benjamin Colman*, which excited considerable attention; but the production on which his reputation rests is his *History of the Puritans* (4 vols. 1732–38), a work of great labor, and invaluable as a collection of facts and characteristics both to churchmen and dissenters, though, of course, written in the interest of the latter. It involved its author in several controversies, which failing health rendered it impossible for him to prosecute. Neal died at Bath, April 4, 1743.

NEAL, David. See page 888.

NEAL, John, an American author and poet, of Scottish descent, was b. at Falmouth, now Portland, Maine, Aug. 25, 1793. His parents belonged to the society of Friends, of which he was a member until disowned, at the age of 25, because he failed to live up to the rule of "living peaceably with all men." With the scanty education of a New England common school, he became a shop-boy at the age of 12; but learned and then taught penmanship and drawing. At the age of 21 he entered a haberdashery trade, first in Boston and then in New York; and a year after became a wholesale jobber in this business at Baltimore, in partnership with another American literary and pulpit celebrity, John Pierpont. They failed in 1816, and Neal turned his attention to the study of law. With the energy which acquired for him the *sobriquet* of "Jehu O'Cataract," affixed to his poem *The Battle of Niagara*, he went through the usual seven years' law-course in one, besides studying several languages, and writing for a subsistence. In 1817 he published *Keep Cool*, a novel; the next year a volume of poems; in 1819 *Otho*, a five-act tragedy; and in 1823 four novels—*Seventy-six*, *Logan*, *Randolph*, and *Errata*. These impetuous works were each written in from 27 to 39 days. In 1824 he came to England, where he became a contributor to *Blackwood's* and other magazines and reviews, and enjoyed the friendship and hospitality of Jeremy Bentham. On his return to America he settled in his native town, practiced law, wrote, edited newspapers, gave lectures, and occupied his leisure hours in teaching boxing, fencing, and gymnastics. Among his numerous works are *Brother Jonathan; Rachel Dyer; Bentham's Morals and Legislation; Authorship; Down-easters*, etc. After a long silence, devoted to professional business, he published, in 1854, *One Word More*, and in 1859, *True Womanhood*. The latter work, though a novel, embodies the more serious religious convictions of his later years. In 1870 appeared his *Wandering Recollections of a Somewhat Busy Life*. Neal's voluminous writings, with all their glaring faults of haste and inexperience, are full of genius, fire, and nationality.

NEAL, Joseph Clay, 1807–48; b. N. H. He settled in Philadelphia, where in 1831 he became editor of *The Pennsylvanian*, a democratic journal. In 1844 he founded the *Saturday Gazette*, which had a large circulation. His best-known book, *Charcoal Sketches; or, Scenes in a Metropolis*, enjoyed a considerable degree of popularity and was republished in London. He wrote also *Peter Ploddy and Other Oddities*, and a second series of *Charcoal Sketches*.

NEALE, John Mason, 1818–66; b. London. After graduating from Trinity college, Cambridge, he took orders in the Church of England. In 1846 he became incumbent of Crawley and warden of Sackville college, East Grinstead. On nine occasions between 1845 and 1861 he gained the Seatonian prize for an English sacred poem. His published writings on theological and ecclesiastical subjects amount to no less than seventy volumes, of which the best known are: *The History of the Holy Eastern Church; the Patriarchate of Alexandria; Mediæval Preachers; History of the so-called Jansenist Church of Holland; Essays on Liturgiology and Church History; Mediæval Hymns from the Latin*, and *Hymns of the Eastern Church*. He issued, also, a revised edition of Bunyan's *Pilgrim's Progress* for the use of children, which, on account of his notes, was the cause of considerable controversy. He was distinguished as a champion of the ritualistic party in the English church, and as the founder of the Anglican sisterhood of St. Margaret, East Grinstead.

NEALE, Rollin Heber, D.D., 1808–79; b. Conn.; educated at Columbian college, and in 1838 called to the pastorate of the First Baptist church in Boston, of which he was pastor for over 50 years. He published *The Incarnation; The Burning Bush; Religious Liberty*, and *Holding forth the Word of Life*.

NEANDER, Johann August Wilhelm, by far the greatest of ecclesiastical historians, was born at Göttingen, Jan. 16, 1789, of Jewish parentage. His name prior to baptism was David Mendel. By the mother's side, he was related to the eminent phil-

osopher and philanthropist Mendelssohn (q.v.). He received his early education at the Johanneum in Hamburg, and had for companions, Varnhagen von Ense, Chamisso the poet, Wilhelm Neumann, Noodt, and Sieveking. Already the abstract, lofty, and pure genius of Neander was beginning to show itself. Plato and Plutarch were his favorite classics as a boy; and he was profoundly stirred by Schleiermacher's famous *Discourses on Religion* (1799). Finally, in 1806, he publicly renounced Judaism, and was baptized, adopting, in allusion to the religious change which he had experienced, the name of Neander (Gr. *neos*, new; *aner*, a man), and taking his Christian names from several of his friends. His sisters and brothers, and later his mother also, followed his example. He now proceeded to Halle, where he studied theology with wonderful ardor and success under Schleiermacher, and concluded his academic course at his native town of Göttingen, where Planck was then in the zenith of his reputation as a church historian. In 1811 he took up his residence at Heidelberg university as a privat-docent; in 1812 he was appointed there extraordinary professor of theology; and in the following year was called to the newly established university of Berlin as professor of church history. Here he labored till his death, July 14, 1850. Neander enjoyed immense celebrity as a lecturer. Students flocked to him not only from all parts of Germany, but from the most distant Protestant countries. Many Roman Catholics, even, were among his auditors, and it is said that there is hardly a great preacher in Germany who is not more or less penetrated with his ideas. His character, religiously considered, is of so noble a Christian type that it calls for special notice. Ardently and profoundly devotional, sympathetic, glad-hearted, profusely benevolent, and without a shadow of selfishness resting on his soul, he inspired universal reverence, and was himself, by the mild and attractive sanctity of his life, a more powerful argument on behalf of Christianity than even his writings themselves. Perhaps no professor was ever so much loved by his students as Neander. He used to give the poorer ones tickets to his lectures, and to supply them with clothes and money. The greater portion of what he made by his books, he bestowed upon missionary, Bible, and other societies, and upon hospitals. As a Christian scholar and thinker, he ranks among the first names in modern times, and is believed to have contributed more than any other single individual to the overthrow, on the one side, of that anti-historical rationalism, and on the other of that dead Lutheran formalism, from both of which the religious life of Germany had so long suffered. To the delineation of the development of historical Christianity, he brings one of the broadest, one of the most sagacious (in regard to religious matters), one of the most impartial yet generous and sympathetic intellects. His conception of church history as the record and portraiture of all forms of Christian thought and life, and the skill with which, by means of his sympathy with all of these, and his extraordinary erudition, he elicits, in his *Kirchengeschichte*, the varied phenomena of a strictly Christian nature, have placed him far above any of his predecessors. Neander's works, in the order of time, are: *Ueber den Kaiser Julianus und sein Zeitalter* (Leip. 1812); *Der Heil. Bernhard, und sein Zeitalter* (Berl. 1813); *Genetische Entwickelung der vornehmsten Gnostischen Systeme* (Berl. 1818); *Der Heil. Crysostomus und die Kirche besonders des Orients, in dessen Zeitalter* (2 vols. Berl. 1821–22; 3d ed. 1849); *Denkwürdigkeiten aus der Geschichte des Christenthums und des Christlichen Lebens* (3 vols. Berl. 1822; 3d ed. 1845–46); *Antignosticus, Geist des Tertullianus und Einleitung in dessen Schriften* (Berl. 1826); *Allgemeine Geschichte der Christlichen Religion und Kirche* (6 vols. Hamb. 1825–52); *Geschichte der Pflanzung und Leitung der Kirche durch die Apostel* (2 vols. Hamb. 1832–33; 4th ed. 1847); *Das Leben Jesu Christi in seinem geschichtlichen Zusammenhange*, written as a reply to Strauss's work (Hamb. 1837; 5th ed. 1853); *Wissenschaftliche Abhandlungen*, published by Jacobi (Berl. 1851); *Geschichte der Christlichen Dogmen*, also published by Jacobi (1856). The majority of these works, including the most important, have been translated into English, and form more than a dozen volumes of Bohn's "Standard Library."

NEAP-TIDES. See TIDES.

NEAR'CHUS, the commander of the fleet of Alexander the Great in his Indian expedition, 327–26 B.C., was the son of one Androtimus, and was born in Crete, but settled in Amphipolis. In 329 B.C. he joined Alexander in Bactria, with a body of Greek mercenaries, and when the latter ordered a fleet to be built on the Hydaspes, Nearchus received the command of it. He conducted it from the mouth of the Indus to the Persian gulf, in spite of great obstacles, resulting partly from the weather and partly from the mutinous disposition of his crews. Nearchus left the Indus on Sept 21, 325, and arrived at Susa, in Persia, in February 324, shortly after Alexander himself, who had marched overland. Fragments of his own narrative of his voyage have been preserved in the *Indica* of Arrian.—See Dr. Vincent's *Commerce and Navigation of the Ancients in the Indian Seas* (vol. i. pp. 68–77, Lond. 1807), and Geier's *Alexandri Magni Historiarum Scriptores* (pp. 108–150).

NEATH, a parliamentary and municipal borough and river-port of the co. of Glamorgan, South Wales, on a navigable river of the same name, seven m. n.e. of Swansea. It is built on the site of the Roman station *Nidum*, and it contains the remains of an ancient castle, burned in 1231. In the immediate vicinity are the imposing ruins of Neath abbey, described by Leland as "the fairest abbey in all Wales," but now sadly decayed and begrimed by the smoke and coal-dust of the public works of the district. There are at Neath several extensive copper and tin works. Copper, spelter,

iron and tin plates, and fine bricks are extensively exported, stones are quarried, and coal and culm are raised. The trade of the port has largely increased within late years. Pop. '81, 10,447.

NEB-NEB, or NIB-NIB, the dried pods of *Acacia Nilotica*, one of the species of Acacia (q.v.) which yield gum-arabic, and a native of Africa. These pods are much used in Egypt for tanning, and have been imported into Britain.

NEBO, the name of a well-known deity of the Babylonians and Assyrians. He presided over learning and letters. He is called the "far-hearing," "he who possesses intelligence," "he who teaches or instructs." He generally has the distinguished titles of "Lord of lords," "Holder of the scepter of power," etc. Hence Layard thinks the name is derived from the Egyptian *Neb*, Lord, The wedge or arrow-head—the essential element of cuneiform writing—was his emblem. His character corresponds with that of the Egyptian Thoth, the Greek Hermes, and the Latin Mercury. A statue of Nebo was set up by Pul, the Assyrian monarch, at Calah (Nimrud), which is now in the British museum. Nebo early held a prominent place in Babylonia, and from a remote age a great temple was dedicated to him at Borsippa, the modern *Birs Nimrud*, and that ancient town was especially under his protection. He was the tutelar god of the most distinguished Babylonian kings, of whose names the word Nebo or *Nabu* forms a part, as *Nebu*-chadnezzar, *Nebu*-zaradan, and some mentioned in classical writers, as *Nebo*-nedus, *Nabo*-nassur, *Nabo*-polassar. Astronomically, Nebo is identified with the planet nearest the sun. Nebuchadnezzar rebuilt his temple at Borsippa, where his worship was continued to the 3d or 4th c. after Christ.

NEBRASKA, or PLATTE, a river of Nebraska, rises in the Rocky mountains, lat. 42° 30′ n., long. 109° w., and flowing easterly 600 m. through the entire territory, watering its great valley, falls into the Missouri.

NEBRASKA, one of the United States of America, lying in lat. 40° to 43° n., and long. 95° to 104° w.; bounded on the w. by Wyoming, and n. by Dakota, being partly separated from the latter by the Missouri river and its branch the Niobrara; e. by Iowa and Missouri, from which it is separated by the Missouri river; s. by Kansas and Colorado. This state is about 425 m. from east to west, and from 138 to 208 from north to south, and has an area estimated at 75,995 sq. miles. Originally, when this state was a territory, it extended from the Missouri river to the Rocky mountains, and from lat. 40° to the boundary of what was, at the time, British America. The chief towns are Omaha city, the starting point of the Union Pacific railway, Nebraska City, and Lincoln, the capital. Nebraska is a vast plain rising gradually towards the Rocky mountains, with immense prairies, the haunts of vast herds of buffalo, and with fertile and well-timbered river-bottoms. The chief rivers are the Missouri on its eastern, and the Niobrara, partly on the northern boundary, the Platte or Nebraska, and the Republican fork of the Kansas, and their branches. The Platte valley, running through the whole center of the territory, is broad and fertile. There are quarries of sandstone, a soft limestone which hardens on exposure, and thin beds of coal. In the mountainous western region are mines of gold, silver, copper, and cinnabar. Between the fertile lands of the eastern and central portion and the mountains is a great desert valley of 30 by 90 m., 300 ft. deep, full of rocky pinnacles, and rich in fossil remains. The climate is dry and salubrious, with an abundance of clear sunny days. The country produces wheat, maize, hemp, tobacco, and fruits in abundance, while the rolling prairies afford unequaled pasturage. The Omahas, Pawnees, Otoes, Sioux, and other wild tribes hunt over the unoccupied territories, but the immigration is progressing rapidly. Erected as a territory in 1854, it had, in 1860, a population, exclusive of Indians, of 28,836; and in 1870, with the same exclusion, it was 122,117. Nebraska became a state in 1867. See *Nebraska*, by Edwin A. Curley (Lond. 1875).

NEBRAS'KA (*ante*), was originally a portion of the Louisiana territory ceded to the United States by France in 1803, and it formed successively a part of the Louisiana and Missouri territories until 1854. During the winter of that year Stephen A. Douglas succeeded, amid much political excitement, in having congress pass what was widely known as his Kansas-Nebraska bill, which resulted in the establishment of Nebraska as a territory. It included a part of Dakota, Montana, Wyoming, and the n.e. portion of Colorado at that time; but in 1861 and 1863 it was reduced to its present limits. Up to the summer of 1854 it had had no civilized residents except the soldiers sent to keep the Indian tribes in order, the missionaries, and the fur traders; and until the construction of the Pacific railroad the population increased very slowly. The principal growth has been since its admission to the union as a state, and during the past ten years it increased at a rapid rate. The pop. in '80, was 452,432—355,042 of American birth; 2,627 colored. Nebraska has also within the past few years begun to take a prominent place as an agricultural and stock-raising state. The soil in the eastern part of the state is deep and fertile, and the whole region s. of the Platte river and e. of the 99th meridian is a rich black vegetable mold from two to ten ft. deep, slightly impregnated with lime, free from stones or gravel, and easily plowed to any depth required. The agricultural region embraces about 30,000 sq.m., extending 150 m. w. of the Missouri, and in the valley of the Platte 300 miles. Wheat, corn, barley, oats, sorghum, flax, hemp, and all

vegetables may be raised; and below lat. 42° the common small fruits grow in abundance. The grazing regions comprise about 23,000,000 acres, and is generally well watered. The wild grasses, of which 150 species have been classified, yield on the bottom and table lands from 1½ to 3 tons an acre and are very nutritious. Large numbers of cattle are brought from Texas and Kansas to be fattened on the grasses of Nebraska preparatory to sale; and the cattle drives which pass through the state are a growing source of material prosperity. The drive of 1879 from Texas and the south-western ranges is reckoned at 250,000 head, and that from Montana and Oregon at 100,000. Formerly Kansas was the northern limit of the drive; but the great rendezvous of cattle drovers, which used to be at Abilene on the Kansas Pacific road, is now to be found at Ogallala on the Union Pacific road in Nebraska, which point, it is believed, will soon become the greatest stock thoroughfare on the continent. The number of acres of improved farm land in 1880 was nearly 5,505,000; number of farms, 63,387, of which 355 contained less than 10 acres each, 708 from 10 to 20, 3,301 from 20 to 50, 1,662 from 50 to 100, 41,452 from 100 to 500, and 666 from 500 to 1,000; 118 farms contained 1,000 acres and over. Their cash value was estimated to be $105,932,541, and the value of the farming implements and machinery to be $7,820,917. The estimated value of all farm productions was $31,708,914. Among the products in 1883 were: Indian corn, 101,278,900 bush.; wheat, 27,481,300 bush.; rye, 1,026,080 bush.; oats, 21,630,000 bush.; barley, 3,623,880 bush.; buckwheat, 27,720 bush.; potatoes, 6,361,520 bush.; hay, 5,075,000 tons; total valuation of these crops, $54,559,197. Among the products in 1884 were: corn, 122,100,000 bush.; wheat, 28,325,000 bush.; oats, 21,844,000 bush. The number of acres devoted to these crops was: corn, 3,235,298; wheat, 1,950,280; oats, 648,193. Other products of the state are: sweet potatoes, peas and beans, flax-seed, wool, cheese, butter, hops, honey, sorghum molasses, wine, tobacco. Of the live stock there were, Jan. 1, 1884: horses, 284,753; mules, 24,958; milch cows, 255,544; oxen and other cattle, 1,368,500; sheep, 333,834; hogs, 1,786,383. The greatest obstacle that the farmers have to contend against is the visitations of grasshoppers or locusts, and Nebraska seems to be more subject to devastations of this kind than most of the other western states. Considerable attention is given to forestry, and up to 1880, about 58,000,000 trees had been planted. The board of fish commissioners has a hatchery in Sarpy co. of 52 acres, and has stocked many of the streams and bodies of water with salmon, German carp, brook, and California trout. The climate is mild and dry, but drought rarely damages the crops, for the soil is such that it withstands extreme and prolonged heat. The mean temperature during the winter months ranges from 22° to 30°; that of the spring from 47° to 49°; of the summer from 70° to 74°; and of the autumn from 49° to 51°. The heat of the summer is tempered by the prairie winds and the nights are usually cool. The greatest amount of rain falls in May and June. A weather-record, kept from 1863 to '69, at Nebraska City, gives the mean annual rainfall as 30.36 in., of which 20.87 in. fell between the first of April and the first of October, and only 9.49 in. between these dates reversed.

Metals and minerals have not yet been found to any extent in Nebraska. Coal has been discovered here and there, ranging in layers from 5 to 22 in., but it has not so far yielded sufficient quantities for the home demand. Prof. Hayden believes that this deposit is the western margin of the great coal-basin of Missouri and Iowa, and that the coal is so much thinned out by pressure from above that it will not prove profitable to mine to any extent. Building-limestone has also been discovered, and is in daily use for the erection of dwellings, together with a dark, yellowish, gray sandstone, and a dark freestone. Clay, for the manufacture of brick, is easily obtained, and in the central and western parts of the state there are numerous salt-basins, yielding 16 per cent of salt, which is declared to be the purest and best in the world. Smelting works have been in successful operation at Omaha since 1871, and in the year 1873 they turned out in fine silver and gold about $1,100,000, and during the following year they refined and separated 7,000 tons of base bullion, and smelted 2,000 tons of ore. The value of the gold and silver produced was $1,350,000; the quantity of lead shipped 6,500 tons, valued at $800,000, making a total of the value of products of this establishment $2,135,000. Though the manufacturing industry of the state is in its infancy, there are already car-works, foundries, distilleries, gas-works, breweries, flouring mills, broom factories, pork packeries, soap-works, pickle factories, carriage, wagon, and implement factories in prosperous existence. Altogether there were, 1880, 1,403 manufacturing establishments, employing 4,793 operatives and $4,881,150 capital using $8,208,478 of raw material, and producing annually goods valued at $12,027,336.

Nebraska necessarily has only a domestic commerce. Except that portion of the state's productions and manufactures that are shipped on the Missouri river, all are transported over the railroads. The actual amount of this trade has never yet been accurately estimated, but in 1874 more than 1,500,000 bushels of grain were sent to the market by a single railroad, from which an idea at least may be formed of the magnitude of the state's relations to the general commerce of the country. In 1884 there were 63 national banks in operation in the state, with a paid-in capital of $4,735,000 and an outstanding circulation of $1,704,720; there were, 1882, 37 state banks, with an aggregate capital of $700,328, and 149 private banking-houses. The number of railroads in operation was 12, with 2,482 m. of track. These were the Chicago St. Paul Minneapolis and Omaha, Fremont Elkhorn and Missouri Valley, the Burlington and Missouri River, the Missouri

Pacific, the Omaha and Republican Valley, the St. Joseph and Western, the Sioux City and Pacific, the Tremont Elkhorn and Missouri Valley, the Union Pacific, the Marysville and Blue Valley, the Omaha Niobrara and Black Hills. The capital stock of all the roads in 1884 was $66,049,400; and their cost and equipment, according to the reports of the various companies, was $169,256,412. The Union Pacific traverses the entire state from e. to w.; the Burlington and Missouri has direct through connection between Kearney, in central Nebraska, and Chicago; the Missouri Pacific places the eastern part of the state in communication with St. Louis; and the St. Joseph and Denver in the s., the Sioux City and Pacific in the n., together with connecting roads to the eastward and elsewhere, afford Nebraska excellent facilities for moving her produce and for carriage traffic generally. A law was passed in 1881, forbidding railroad companies from charging, collecting, or receiving, for transportation, a higher rate than was charged in November, 1880, (drawbacks and rebates being also forbidden), and prohibiting said companies from demanding, charging, collecting or receiving, for such transportation for any specific distance a greater sum than that demanded, charged, collected, or received for a greater distance. The Platte and other rivers in the interior of the state are too shallow for purposes of navigation.

In 1884 the state had no indebtedness except $50,000, in 10 per cent 10-year bonds, issued for the relief of grasshopper sufferers in 1875, and $449,267.35 in 8 per cent funding bonds, issued April, 1877, providing for the outstanding warrants and other indebtedness, making a total of $499,267.35. The assessed value of all taxable property during the year 1883 was $110,543,644. The rate of taxation was 7.55 mills on each dollar; the state receipts for the fiscal period of two years were $2,707,276; expenses, $2,736,574. Every able-bodied male citizen between 18 and 45 is subject to military duty. The active force, or state national guard, was organized by law, in 1880, to consist of 2,000 men, recruited for three years by volunteering, and to be distributed among four regiments. Among the laws passed in 1883 was one obliging employers to provide chairs for women in their employ, and one providing that every inmate of the hospital for the insane shall be allowed to write one letter a week and have it posted without censorship. A poll tax of $3.00 must be paid by males between 21 and 50, either in cash or road labor. The property of corporations is taxed in the same manner as that of individuals.

The educational interests of the state have been for many years watchfully managed. The school lands donated by the government comprised, in 1883, 1,872,846 acres for schools in general, and 400,000 acres for the erection and maintenance of a state university at Lincoln. Out of the sale and lease of these lands and a general tax of two mills, together with the money received from fines, licenses, and a dog tax, the schools are supported, the apportionment being made by a state superintendent among the counties according to the number of children between the ages of 5 and 20 years. In 1882 there were 3,401 school districts, containing 165,511 children, of whom 115,546 attended school. The total number of school buildings was 3,038. Their value was estimated at about $2,234,464. The number of male teachers employed was 1,862; of female, 3,507. The average monthly wages of the first was $37.50; of the second, $29.34. The total receipts for school purposes from all sources were $1,360,000; and the total expenditures, $1,358,346. There are graded schools in many towns, and high schools in every town. There is a state normal school at Peru, and a chair of didactics at the state university. There is a normal training school at Santee agency under the care of the Congregationalists, and normal training is given at 3 of the schools for Indians superintended by the P. E. bishop of Niobrara. Normal instruction is also given at Doane and Hastings colleges, at Nebraska Wesleyan university, Nebraska conference seminary, and in the Blake school at Beatrice. The state university at Lincoln, in 1883, had two departments organized. Among the institutions for young men or both sexes are Creighton college (Roman Catholic), at Omaha; Doane college (Congregational), at Crete; Nebraska college (Protestant Episcopal), at Nebraska City; Nebraska Wesleyan university, at Fullerton. Brownell Hall, Omaha (Protestant Episcopal), is a collegiate institution for young women. Scientific instruction is given in the industrial department of the state university and there are scientific courses at the state university, Doane college, and Nebraska Wesleyan university. There were in 1883, a theological school (P. E.) at Nebraska City, and a medical school at Omaha. Women who own assessed personal property, or have children of school age, may vote in school meetings. The number of newspapers and periodicals published in 1880 was about 189. Of these 15 were dailies, 165 weeklies, 1 semi-monthly, and 7 monthlies. The leading denominations are: Baptist, Christian, Congregational, Disciples, Protestant Episcopal, Evangelical Association, Lutheran, Methodist, Presbyterian, Roman Catholic, United Brethren in Christ, Universalist.

The constitution of Nebraska provides that every male person of the age of 21 years and upwards, who is a citizen of the United States or has declared his intention 30 days previous to an election to become a citizen, and who is neither insane, an idiot, nor an unpardoned felon, shall be entitled to vote, provided he has resided in the state six months. The executive department consists of a governor, lieutenant-governor, secretary of state, auditor of public accounts, treasurer, superintendent of public instruction, and commissioner of public lands and buildings, who are elected every two years. In 1885 the house of representatives consisted of 100 members, and the senate of 33. The judicial power is vested in a supreme court of three judges, elected for six years; six district courts, with one judge for each, elected for four years; and county courts, each presided over by one

judge, whose term of office is two years. Justices of the peace and police magistrates are appointed to try minor cases. Under the apportionment of 1882 the state is entitled to three representatives in congress. Its electoral votes have been cast as follows: 1868, Grant and Colfax, 3; 1872, Grant and Wilson, 3; 1876, Hayes and Wheeler, 3; 1880, Garfield and Arthur, 3; 1884, Blaine and Logan, 5.

NEBRASKA CITY, the co. seat of Otoe co., Neb., on the w. bank of the Missouri river, 44 m. s. of Omaha, on the Nebraska railroad: pop. '80, 4,183. It has a courthouse, churches, schools, banks, 2 daily and 3 weekly newspapers, the academy of the Annunciation, under Catholic control, and Nebraska college, under Episcopal control. There are flour mills, breweries, machine shops, foundries, etc.

NEBUCHADNEZ'ZAR. See BABYLON.

NEBULÆ, a name given to indistinct patches of light in the heavens, supposed to proceed from aggregations of rarely distributed matter belonging to distant worlds in the course of formation. By the gradual improvement of telescopes in power and distinctness, these nebulæ have, one after another, become resolved into clusters of distinct stars, and it is now generally supposed that such a resolution of all nebulæ which have been observed is only limited by the power of the telescope. It is probable that the group of stars with which our system is immediately surrounded, and which forms to our eyes the galaxy which studs the firmament, would, if looked upon from the immeasurable distances at which the so-called nebulæ are situated, itself assume the appearance of such a nebula; and that in the intervals there exist spaces as void of starry worlds as these are comparatively full of them. See STARS. Some nebulæ are of a round form presenting a gradual condensation towards the center; others consist of one star surrounded by a nebulous haze; while a third class present just the same appearance as would be exhibited by the solar system, if seen from a point immensely distant. These and other phenomena suggested to Laplace the idea, afterwards developed into a theory, and known as the *nebular hypothesis*, that these nebulæ were systems in process of formation; the first stage presenting an agglomeration of nebulous matter of uniform density, which, in the second stage, showed a tendency to gradual condensation towards the center; and, finally, the nebulous matter round the now-formed center of the system, separated itself into distinct portions, each portion becoming condensed into a planet. The same opinion regarding the formation of planets from nebulæ was put forward by sir William Herschel in 1811; but the subsequent discoveries made by lord Rosse, were supposed to expose a fallacy in this theory. That wonderful instrument, the spectroscope, has, however, recently reinstated the nebular theory, by showing that among these appearances there are real nebulæ devoid of solid or liquid matter, and consisting of masses of glowing gas—apparently nitrogen and hydrogen.

NEBULÆ (*ante*). The earliest mention of nebulæ is that of the Arabian astronomer Sufi, who, in the 10th c. described the Magellanic clouds and the nebula in Andromeda. Ptolemy had made a catalogue of "cloudy stars," but the objects he mentioned are easily resolvable into star clusters with small telescopes. The nebula in Andromeda, which is visible to the naked eye, was the only one discovered before the invention of the telescope, although a few others are now known which are faintly visible. In 1656 Huyghens discovered the great nebula in the constellation Orion, publishing an account of it along with the discovery of the rings of Saturn in 1659. In 1714 Halley described six nebulæ. In 1755 La Caille sent a list of 42 nebulæ which he had discovered at the cape of Good Hope, to the academy of sciences at Paris. Messiers published a list in 1783 and 1784, containing an account of 103 nebulæ, the greatest number described by one observer before the observations of sir William Herschel, who, in 1781, with a five-foot reflector of his own construction began his investigation of the heavens, his first performance being the discovery of Uranus. By the use of this and other telescopes he was enabled in 1786 to communicate to the royal society a catalogue of 1000 new nebulæ and clusters; in 1787 a second catalogue of another 1000, and in 1802 a third, containing 500 more. Sir John Herschel, between 1825 and 1830 reviewed a portion of his father's work, adding a list of 500 nebulæ and clusters of his own discovery, making in all a list of 2,306 nebulæ and clusters in the northern hemisphere, which he sent to the royal society. In 1833 he took his instruments to the cape of Good Hope, the result of which was a catalogue of 1708 nebulæ and clusters in the southern heavens. The whole number of nebulæ and clusters now known is over 5,000. The most complete catalogue is that of sir John Herschel, published in 1864, which contains all that were accessible to him up to 1863. The number there recorded is 5,079. The *nebulæ* have presented a subject about which there has always been doubt, in regard to their position as well as constitution. After many of them had been resolved into starry clusters it was thought they were all galaxies similar to our own solar system, and sir William Herschel adopted this view in regard to certain nebulæ which he supposed were external to our stellar system, but afterwards in developing his nebular hypothesis, he found it difficult to distinguish between the external nebulæ and those which are generally thought to be parts of our own sidereal system. Proctor expresses the opinion "that our sidereal system extends far beyond the limits which have ordinarily been assigned to it, and that there are no nebulæ which can be regarded as external to it." Herschel concluded that there were nebulæ which are not resolvable into stars, and that they consisted of gaseous matter. The forms of nebulæ

are various, and they change in appearance with different powers of the telescope. The spiral nebulæ, which were first made known by lord Rosse are examples of this kind, their spiral form having previously not been suspected. Some planetary nebulæ resemble planets, and when viewed with telescopes of high power present a complicated appearance. Some have the appearance of a ring and are called annular nebulæ; there is a beautiful example in the constellation Lyra in which a central mass is surrounded by a ring. Some are in pairs, like double stars. Small nebulæ generally have the appearance of a bright nucleus surrounded by a veil; some of them are called stellar nebulæ. Others are very irregular, and have long filmy arms. Those in Orion and Andromeda are examples, as also the great nebula in Argo which was carefully described by sir John Herschel in his Cape observations. Those nebulæ which are resolvable into stars give spectra which resemble the spectra of stars, while those which are obtained from the light of unresolvable nebulæ give a spectrum of three, sometimes four, bright lines, one of which corresponds to a line in the spectrum of hydrogen, and another to a line in that of nitrogen. The planetary nebulæ also give similar gaseous spectra. Of 70 nebulæ examined by Huggins about one-third gave gaseous spectra. The nebular hypothesis in regard to the formation of the universe, although previously proposed by Swedenborg, Buffon, and Kant, was first systematized by Herschel and Laplace, and has been since modified. Laplace's earlier ideas were embraced in a consideration as to the manner of the formation of our solar system. He conceived that a mass of highly-heated vaporous matter occupied a space larger than the orbit of the farthest planet. In consequence of molecular and gravitating forces it acquired rotation, by which it threw off rings of matter which afterwards broke up into planets and their satellites. Herschel's theory caused a modification of Laplace's who adopted the idea that primordial nebulous matter still existed which was being formed into nebulæ and clusters. The general idea now entertained is that this primordial matter has accomplished the work of world formation by the action of gravity aided by molecular forces. It is assumed by some that on physical principles primordial matter widely distributed through space would pass through the following changes. Gravitation would cause the mass to contract, and become more dense; this would be followed by atomic repulsion, which acting against gravitation would produce heat. After a certain degree of condensation had taken place molecular combination would result, which would again cause a great evolution of heat; this would be followed by radiation and precipitation of binary atoms as flocculi floating in the rarer medium: these flocculi will tend to move toward a common center, but as the mass is irregular the motion will really be to one side of the center. This will result in a spiral movement. Mutual attraction will produce groups of flocculi, moving around local centers of gravity. There will be here and there detached portions which will not coalesce with the larger internal masses, but will slowly follow without overtaking them, thus accounting for the formation of comets. Many dynamic principles are involved in such motions and changes of matter which have received the attention of scientists, of which may be mentioned the investigation of molecular vortices by Rankine, and of vortex rings by Helmholtz and Thomson, and the preservation and disruption of revolving rings by Maxwell, Peirce, and Hind in memoirs on the rings of Saturn, that although grand and instructive views have been obtained of the regions of space, the brilliant investigations of science have as yet afforded no positive knowledge of its infinite depths, or of its genesis.

NE'BULY, one of the partition lines in heraldry, which runs out and in in a form supposed to represent the uneven edges of clouds.

NECESSITY. This word occurs in connection with two different philosophical subjects, namely, the freedom of the will (see FREE-WILL), and the nature of our belief in fundamental truths, such as the axioms of mathematics. It is alleged by some philosophers that the truths held by us as most certain are the result of experience, and that the degree of certainty is but a measure of the universality of the experience. Others contend that such first principles as the axioms of mathematics are not only true, but *necessarily* true. Such necessity, it is argued, cannot come from mere experience, and therefore implies an innate or intuitive source. Hence the theory of necessary truth is only another name for the theory of instinctive or intuitive truth.

Necessity is a word too vague in its signification to serve as a leading term in philosophy. There are several meanings attaching to it which should be clearly set forth before entering on the discussion of such questions as those above mentioned.

1. Necessity, in the first place, means that one fact or statement is *implied* in another. Thus, if we say that all the apostles were Jews, it follows necessarily that Peter was a Jew; this is not a new fact, but merely a reassertion of a portion of the same fact. We are not at liberty to affirm a thing in one form, and then deny the same thing when expressed in a different form. If we say this room is hot, it is repeating the assertion in another way, to say that it is not cold. These truths follow by necessary inference. Hence the general axiom of the syllogism, that what is true of a whole class must be true of each individual, is a necessary truth in this sense. In affirming such a truth, we merely declare that we shall be consistent, and that when we have affirmed a proposition in company with other propositions, we are prepared to affirm it when taken apart from the others This kind of necessity is sometimes called logical necessity, and sometimes

mathematical necessity. We might call it deductive necessity, or necessity by implication.

2. A second meaning is inductive certainty; or the certainty that arises from a well-grounded experience. That lead will sink in water; that animals need food and air in order to live; that warmth promotes vegetation,—are truths that we call necessary, in the sense of being so certain that we may always count upon them. We presume with the highest confidence, that an unsupported body will fall to the ground, not because the fact of falling is implied in the fact of matter, but because nature has uniformly conjoined the two facts. We can speak even of moral necessity; by which we mean only uniform sequence and consequent certainty. When we declare that children, whose education has been neglected, must fall into evil courses, we declare what experience has shown us will happen in relation to the human mind.

3. When necessity means neither deductive implication, nor inductive certainty, it refers us to a peculiar test supposed to apply to the truths in dispute—namely, the inconceivableness of their opposite. It is said that, not only can we not *believe* in the opposite of the axiom, that "the sums of equals are equal," but we cannot even *conceive*, imagine, or picture to ourselves the opposite of it. This impossibility of conceiving the contradiction of any statement, is regarded by many as a peculiarly cogent circumstance in its favor. It distinguishes the axiomatic first principles from the truths of inductive science, these having, it is said, an inferior order of certainty. To this it may be replied, however, that men's power of conceiving is so much affected by their education and habits, that many things, whose opposites were at one time inconceivable, have since been found to be false. For example, the notion that men could live at the antipodes was once reckoned inconceivable, and we now know it to be a fact. An unvarying association will often produce a disability to conceive anything different.

In commencing a discussion as to the necessary character of any truth, the disputants should agree beforehand which of the three meanings they intend. In the controversy on the mathematical axioms, maintained between Dr. Whewell on the one hand, and sir John Herschel and Mr. J. S. Mill on the other, the third meaning is more particularly involved. The doctrine of inconceivability, as the test of truth, has been put forward by Mr. Herbert Spencer, under the title of the universal postulate (*Principles of Psychology*, Part I).

NECHES, a river of Texas, rises in the central eastern portion of the state, and flows s. by e., 200 m., into Sabine bay, where its waters, with those of the Sabine river, find their way, by Sabine pass, into the gulf of Mexico.

NECHO, Pharaoh Necho, or Neku, an Egyptian king, son and successor, according to Herodotus, of Psammeticus, and contemporary of Josiah king of Judah. Sacred and profane writers relate his successful wars in Syria. Soon after his accession to the throne he prepared large fleets on the Mediterranean and Red seas, and sent some expert Phenician sailors to explore the coasts of Africa. They are said to have circumnavigated Africa, by which its peninsular form was ascertained, more than 2,000 years before Vasco de Gama doubled the cape of Good Hope. He attempted also to reopen the canal connecting the Red sea with the Nile. To check the power of the Assyrians, he collected a large army at the beginning of his reign, B.C. 610, and entered Palestine with the view of besieging Carchemish on the Euphrates. But Josiah resented his passage through his territory, and, though Necho sent messengers disclaiming any hostile designs, Josiah encountered him in the plain of Megiddo, about 40 m. n. of Jerusalem. Josiah's forces were routed with great slaughter. He himself was wounded with an arrow, and his attendants, removing him from his chariot, conveyed him to Jerusalem, where he died. Necho proceeded on his march to the Euphrates. Three months after the capture of Carchemish and the defeat of the Chaldeans, he learned that Jehoahaz, a younger son of Josiah, had usurped the throne of his father. Necho deposed him, condemned the land to a yearly tribute, and carried him prisoner to Jerusalem. He then made Eliakim king, changing his name to Jehoiakim, took the silver and gold which had been levied from the Jewish nation, and returned to Egypt with Jehoahaz. Four years afterwards he again marched into Syria against the Babylonians, but Nebuchadnezzar completely routed his army, and, advancing through Palestine, took from Necho all the Egyptian possessions from the Euphrates to the southern extremity of Syria. Nebuchadnezzar deposed Jehoiachin, who had succeeded his father, and carried the warriors and treasures to Babylon. Necho died soon after, having reigned, according to Herodotus, 16 years. He was of the Saïte 26th dynasty, of which Manetho makes him either the fifth ruler or the sixth. Herodotus calls him Nechôs. He was succeeded by Psammeticus II.

NECKAR, one of the largest tributaries of the Rhine, and the principal river of Würtemberg, rises near to the source of the Danube, on the eastern declivity of the Black forest, and close to the village of Schweningen. It has a winding course of 240 m., first n.e. to its junction with the Fils, then n. to its junction with the Jaxt, and finally n.w. to Mannheim, where it joins the Rhine. The principal places on its banks are Tübingen, Heilbronn, Heidelberg, and Mannheim. Its course, leading first through a deep and narrow dale, leads afterwards through a succession of wide and fertile tracts, inclosed by soft vine-clad hills. The scenery of its banks is, in general, very beautiful, and in many places highly romantic. From Cannstadt, about midway in its course, the Neckar is

navigable; steamers ply regularly to Heidelberg. Good wines are grown on its banks. Chief affluents, on the left, the Enz; on the right, the Fils Rems, the Kocher, and the Jaxt.

NECKER, Jacques, a famous financier and minister of France, was b. Sept. 30, 1732, at Geneva, where his father, a native of Brandenburg, but of Anglo-Irish descent, was professor of German law. He became a banker in Paris and acquired a large fortune during the seven years' war. After retiring from business he became the representative of his native city at the French court; and also acquired a high but not exactly a solid reputation by his publications on political economy and finance, particularly his *Essai sur la Législation et le Commerce de Grains* (Par. 1775). In this essay he appears as the opponent of the wise Turgot's liberal measures in regard to the traffic in grain, and claims for the state the right of fixing its price, and if it thinks it necessary, of prohibiting its exportation. On the removal of Turgot from office in June, 1776, Necker was called to assist in financial affairs, and after the brief administration of Clugny he was made general director of finances in June, 1777. Necker could not conceal his elation. This was his weak point. He had all the vanity, egotism, and love of show that marked his brilliant but superficial daughter. Nevertheless he succeeded not only in meeting the exigences of the American war, but in restoring to some degree of order the general financial affairs of the country, though mainly by the perilous expedient of borrowing, which he was enabled to do to an almost unlimited extent, owing to the confidence reposed in his financial dexterity. Some years he borrowed as much as 490,000,000 of francs. His Protestantism, however, and some retrenchments which he made in the royal household, with his publication on the financial affairs of France (*Compte Rendu*, which produced an immense sensation), made him an object of great dislike to the queen and court, and on May 12, 1781, he was suddenly dismissed. He retired to Geneva, where he was visited, from motives of sympathy and respect, by the highest personages in the realm, the prince of Condé, the dukes of Orleans and Chartres, the prince of Beauvau, the duke of Luxembourg, maréchal de Richelieu, the archbishop of Paris, etc., but returned to Paris in 1787, from which he was soon banished on account of an attack which he published on the financial management of the reckless and ignorant Calonne. In the financial and political crisis, however, which followed upon the financial administration of Loménie de Brienne, Louis XVI. found himself under the necessity of calling Necker in Nov., 1788, to the office of comptroller-general of finances and minister of state. Necker recommended the calling of the states-general, and thereby acquired the greatest popularity. He failed, however, in the difficulties which ensued, having no capacity for political affairs in other than their mere financial aspects. When the court, on June 23, 1789, determined upon nullifying the resolution of the third estate, Necker hesitated, and the king therefore dismissed him on July 11, and required him to leave the French dominions immediately. He obeyed, but the disturbances of July 12, 13, and 14 (on the last of which days the Bastille was taken) were the result of his dismissal, and the king was under the necessity of recalling him. He now allied himself with Mounier and other ministers for the introduction of a constitution like that of Britain, with two chambers or houses of parliament; but this caused a great diminution of his popularity, and he was unable to contend in debate with Mirabeau and other great leaders of the national assembly. On the rejection by the assembly of his scheme of a loan, and the adoption instead of it of Mirabeau's scheme of assignats, he resigned his office in Sept., 1790, and retired to his estate of Coppet, near Geneva, where he died, April 9, 1804. Besides the works already mentioned he published several on political and on religious subjects, particularly a work on the French revolution (4 vols. Par. 1796), which has been frequently reprinted. His daughter was the celebrated madame de Staël.

NECKER, Susanne Curchod de Nasse, 1739–94; b. canton Bern, Switzerland. Her father, the pastor of Nyon, gave her an excellent education, but opposed her union with Gibbon, the historian, with whom she was intimate. In 1764 she was married to Jacques Necker, the finance minister of Louis XVI. Her house in Paris became the resort of Buffon, Diderot, D'Alembert, and most of the celebrities of the time, whose influence she used to further her husband's political advancement. Her principal literary works are *Réflexions sur le Divorce; Mémoire sur l'Etablissement des Hospices*, a treatise upon hasty interments, and five volumes of miscellanies, published by her husband after her death. She founded a hospital in Paris which bears her name. Her life was written in 1820 by Auguste de Staël-Holstein.

NECK-MOLDING. A molding at the junction of the capital and shaft of a column. The plain space between the astragal of the shaft and the moldings of the cap of the Roman Doric order is called the *neck*.

NECROMANCY (Gr. *nekros*, dead, and *manteia*, divination), a mode of divination by the conjuring up of the dead to question them concerning the future. It originated in the east, and in times of the most remote antiquity. It is condemned in the Old Testament; and the story of the witch of Endor affords a remarkable illustration of it, which has not a little perplexed interpreters of Scripture. The eleventh book of Homer's *Odyssey* bears the title of *Νεκρομαντεια*, and in it the shade of Tiresias is represented as brought up and consulted by Ulysses. In most parts of Greece necromancy was

practiced by priests or consecrated persons in the temples; in Thessaly it was the profession of a distinct class of persons called psychagogoi ("evokers of spirits"). The practice of it in that country was ultimately connected with many horrid rites, in which human blood, half-burned portions of bodies from funeral piles, the immature fetus cut out of the womb, etc., were employed, and sometimes human beings were slain that their spirits might be consulted ere they finally passed into the lower world. The establishment of Christianity under Constantine caused necromancy to be placed under the ban of the church. There are evident traces of necromancy in some of the older Norse and Teutonic poems. The mediæval belief in the evocation of spirits belongs rather to sorcery than to necromancy. See Peucer's *Commentarius de Præcipuis Divinationum Generibus* (Zerbst, 1591).

NECROMANCY (*ante*). See SPIRITUALISM, *ante*.

NECROPHILISM, an unnatural and revolting love or appetite for the dead which has manifested itself in various ways. Consorting or living with the dead has been observed as a characteristic of melancholia. Individuals have inhabited grave-yards, preferring the proximity and association of corpses with which they had no tie, to the cheerfulness and comforts of home; and there is recorded one notorious case in which a gentleman, although on bad terms with his wife while alive, carried her body with him through India, scandalizing the natives and outraging the feelings of all by placing the coffin under his bed. This hideous tendency may enter into certain developments of cannibalism where the feast is celebrated in memory of a departed friend, rather than in triumph over a slain foe. It is affirmed that there were anthropophagous epidemics in 1436 and 1500; and the history of vampirism connects that delusion with the moral perversion now described. Patients in asylums, especially in continental asylums, are still often encountered who bemoan the crime of having devoured the dead and violated charnel-houses. The most extraordinary exhibition of necrophilism is where individuals, not in fancy but in reality, have exhumed corpses to see them, to kiss them, to carry them away to their own homes, or to mutilate and tear them to pieces. It is worthy of notice that, so far as such cases have been observed in Great Britain, they have been confined to communities living in remote places, of rude and unenlightened character, and cherishing the superstitions of ages and states of society with which they have no other connection, and of which they have almost lost the recollection.—*Annales, Medico-Psychologiques*, t. viii. p. 472.

NECROP'OLIS, a Greek term, meaning the city of the dead, and applied to the cemeteries in the vicinity of ancient cities. It occurs in classical antiquity only as applied to a suburb of Alexandria, lying to the w. of that city, having many shops and gardens and places suitable for the reception of the dead. The corpses were received and embalmed in it. Here Cleopatra, the last of the Ptolemies, applied the asp to her breast to avoid the ignominy of being led in triumph by Augustus. The site of the necropolis of ancient Alexandria seems to have been where are now the catacombs, consisting of galleries and tombs hollowed out of the soft calcareous stone of which the city is built, and lying at the extremity of the city. The term necropolis is now, however, used in a much more extended sense, and applied to all the cemeteries of the ancient world. These consisted either of tombs, constructed in the shape of houses and temples, and arranged in streets, like a city of the dead; or else of chambers hollowed in the rock, and ornamented with façades to imitate houses and temples. Such cemeteries are to be distinguished from the *columbaria*, or subterraneous chambers of the Romans, in which their urns were deposited; or the rows of tombs along the Via Appia; or the cemeteries of the Christians, whose bodies were deposited in the ground. The most remarkable necropolises are that of Thebes in Egypt, situated at a place called Gournah, on the left bank of the Nile, capable of holding 3,000 persons, and which it is calculated must at least have contained 5,000 mummies; those of El-Kab or Eileithyia; of Beni-Hassan, or the Speos Artemidos; and of Madfun or Abydos; of Siwah or the oasis of Ammon. See OASIS. In Africa the necropolis of Cyrene is also extensive; and those of Vulci, Corneto, Tarquinii, and Capua are distinguished for their painted tombs (see TOMB), and the numerous vases and other objects of ancient art which have been exhumed from them. Large necropolises have also been found in Lycia, Sicily, and elsewhere.

Strabo, xviii. pp. 795–799; Plutarch, vit Anton; Letronne, *Journal des Savans*, 1828, p. 103; Dennis, *Cities and Cemeteries of Etruria*, i. 412, i. 276–358.

NECROSIS (Gr. *nĕkros*, dead) is a term employed to denote the death or mortification of bone, but often restricted to the cases in which the shaft of a long bone dies, either directly from injury or from violent inflammation, and is inclosed by a layer of new bone; the death of a thin superficial layer, which is not inclosed in a shell of new bone, being usually termed *exfoliation*.

The bones of the lower extremity—the femur and tibia—are those which are most frequently affected by necrosis. The lower jaw is, however, extremely often affected by it in persons engaged in making lucifer-matches, the disease being set up by the pernicious action of the vapor of phosphorus. The dead bone, known as the *sequestrum*, generally consists of the circumference of the shaft only, and not of the interior, and the inside of the dead portion presents a rough appearance, as if worm-eaten. If the membrane investing the bone (the periosteum) remain healthy, it deposits lymph, which

speedily ossifies, forming a shell of healthy bone, which completely invests the dead portion.

The essential point in the treatment is the removal of the *sequestrum*, which is too purely a surgical operation to be described in these pages.

NECTAR, the name given by Homer, Hesiod, Pindar, and the Greek poets generally, and by the Romans, to the beverage of the gods, their food being called *ambrosia* (q.v.). But Sappho and Alcman make nectar the food of the gods, and ambrosia their drink. Homer describes nectar as resembling red wine, and represents its continued use as causing immortality. By the later poets nectar and ambrosia are represented as of most delicious odor; and sprinkling with nectar, or anointing with ambrosia, is spoken of as conferring perpetual youth, and they are assumed as the symbols of everything most delightful to the taste.

NECTARINE. See PEACH.

NECTARY, in botany, an organ in the flowers of many phanerogamous plants, devoted either to the secretion or the reception of honey. Of the former kind are nectariferous glands, scales, and pores; of the latter, tubes, cavities, etc. But the term was for a long time very vaguely employed by botanists, and seemed to be found convenient for the designation of any part of a flower for which no other name was known. Thus amongst the parts called nectaries by the older botanists may be found those now called *disk* (q.v.), and that which bears the name of *corona* (q v.).

NEDJED, or NEJD. See WAHABIS, *ante.*

NEEDFIRE (Ger. *nothfeuer;* allied to Sw. *gnida*, to rub; Eng. *knead*), fire obtained by the friction of wood upon wood, or the friction of a rope on a stake of wood, to which a wide-spread superstition assigns peculiar virtues. With varieties of detail, the practice of raising needfire in cases of calamity, particularly of disease among cattle, has been found to exist among most nations of the Indo-European race. It has been supposed effectual to defeat the sorcery to which the disease is assigned. When the incantation is taking place, all the fires in the neighborhood must be extinguished, and they have all to be relighted from the sacred spark. In various parts of the Scottish highlands the raising of needfire was practiced not long ago, and it is perhaps still had recourse to in some very remote localities. The sacrifice of a heifer was thought necessary to insure its efficiency. The ways of obtaining fire from wood have been various; one is by an apparatus which has been called the "fire-churn," a cylinder turning on a pivot, and furnished with spokes, by means of which it is made to revolve very rapidly, and fire is generated by the friction. Fire struck from metal has been supposed not to possess the same virtue, and in some instances the persons who performed the ceremony were required to divest themselves of any metal which might be about them. In its origin the fire-churn was considered a model of the apparatus by which the fires of heaven were daily rekindled. It is still in daily use in the temples of the Hindus. The same superstition was doubtless the origin of the story of Prometheus (q.v.). See Grimm's *Deutsche Mythologie*; Supplement to Jamieson's *Scottish Dictionary.*

NEEDHAM, Mass. See page 888.

NEEDLE-GUN. See BREECH-LOADING ARMS AND NEEDLE-GUNS, *ante.*

NEEDLES are instruments of metal, or other material, for the purpose of carrying the thread in sewing, embroidery, knitting, netting, and other similar operations. They are generally made of metal, but bone, ivory, and wood are also used; for ordinary needlework, called sewing, they are made of fine steel, and are too well known to need description; for other kinds of work they are often much larger and differently formed, according to the requirements of the work to be done.

Needle-making is an important branch of industrial art, and it has of late years attained to extraordinary perfection. Small bars of steel, not thicker than a good-sized bristle, can be made perfectly round, pointed at one end with wonderful accuracy, pierced at the other end with an oval hole, the sides of which are so smoothly rounded that there is no friction upon the thread, and the whole of each instrument, not more than an inch in length, beautifully polished, and sold at less than a shilling per hundred, notwithstanding that a large part of the operations required in their manufacture are manual. The first operation, after the wire has been selected and its thickness accurately gauged, is to cut it into eight-feet lengths; this is done by winding it in a coil of 16 ft. circumference, and then cutting this coil into exact halves with powerful cutting shears. The coiling of the wire is so managed that there are 100 pieces in each half when cut; the bundles of 100 wires are again cut into the necessary lengths for two needles; and so well arranged are the cutting shears, that a man can easily cut enough for 1,000,000 needles in a day of 12 hours. The pieces cut from a coil, although now reduced to the length of two small needles, are nevertheless somewhat curved; they are therefore collected into bundles of about 6,000, and placed in two iron rings, which hold them loosely together; they are then slightly softened by firing, and are laid on an iron plate or bench, and are pressed with a small curved bar in two or three positions, by which the operator manages to make them all perfectly straight. They are now taken to the grinder, who sits in front of his grindstone upon a seat which is hollow, and forms an air-shaft open towards the stone; through this a blast of air is forced when the wheel is in motion, which carries away from the grinder every particle of the subtle dust from the needle

points and the stone. Before this humane invention, which has rendered the operation quite innocuous, the loss of life in this manufacture was more serious than in any other industrial occupation. The operator, with great tact, holds about 25 of the wires, by means of his thumb pressed against the inside of his fingers, the wires, which are held straight and applied to the grindstone, being dexterously turned round on the inside of the hand by means of the thumb, until they are ground sharp at one end; they are then reversed, and the other ends are similarly sharpened. They are next taken to the *impressing* machine, which in principle consists of a weight hanging to a block, which is raised by the hand and let fall at pleasure; the wires are placed in succession under this, so that the falling weight strikes each wire exactly in the middle, and there flattens it. The hardening of the flattened part by the blow is removed in the annealing oven, and the holes are next punched, two in each flattened portion. These are either done by hand-punches worked by children, who acquire great nicety in the operation, or by a machine on the same principle as the *impressing* machine; this not only punches the two holes, but also forms a small cross-cut between them, which is otherwise made by a file. At this cross-cut the wire is broken in two, and may now be regarded as two rudely-formed needles, each having a flattened and pierced head. A number of these are now threaded (*spitted*) on a thin wire, and are placed in a vise, which holds them firm and straight, so that the workman can file the heads on the top and sides, so as to remove all the burred edge. The next process is *oil tempering*, for which they are made hot, and immersed in sufficient oil to coat them thoroughly; the oil is then burned off, an operation which renders the needles brittle. They are then weighed out into lots of about 500,000 each, and after being shaken so that they lie side by side, they are laid on a square piece of strong canvas, and a quantity of sand and emery-powder being mixed with them, they are corded up very securely into a long roll from 18 in. to 2 ft. in length. A number of these rolls or bundles are placed on a movable wooden slab, in the *scouring machine*, and over them is placed another heavily weighted slab. The action of the machine, of which these slabs form part, is to move them backward and forward in opposite directions, the bundles of needles acting as rollers, the pressure upon which works the inclosed needles, sand, etc., together, so that after 8 to 10 hours, which this operation occupies, instead of the blackened appearance they had when it commenced, they are white and silvery-looking. They are now removed to an exactly similar machine, where they are polished. Here they are separated from the sand and emery, and are removed to other canvas squares; and when mixed up with a paste of *putty-powder* and oil, are again corded up, and made to roll backward and forward under the weighted wooden slab of the *polishing machine* for four hours more. The next process is to remove them from the canvas, and agitate them in a vessel with soft-soap and water, to remove the oil and putty-powder, and next to dry them in ash-wood saw-dust. They are now highly polished and well tempered, but not all of exactly the same length, nor are the eyes perfect; they are therefore passed to a person who, by nice management of a small gauge, sorts them very quickly into certain lengths (*evening*), and arranges them all in one direction (*heading*). They then pass on to be drilled, an operation requiring great nicety, as the small oval holes have to be so polished all round, as not to cause any friction on the thread in sewing with them; a clever workman will drill and polish the holes of 70,000 needles per week. The needle is now practically finished, but many minor operations are considered necessary to produce high-finish; these we purposely omit, to avoid complicating our description. It is, however, worthy of remark, that this little instrument, which costs so much labor for its formation, has by these operations acquired immense value. The wire of which the ordinarily-sized needles are made is so thin, that 5½ lbs. go to form 74,000 needles. Of ordinary sized needles, 2¼ millions weigh 3 cwt., and are worth rather more than £200, although the steel wire of which they were made was only worth £14 at the commencement of the manufacture. English-made needles are the best in the world, and are chiefly made in Redditch and the neighborhood, where, and in other parts of the county of Worcester, this manufacture employs a large number of persons.

NEEDLES, The, a cluster of five rocks on the w. point of the Isle of Wight, pyramidal in form: their tops are white, and of a chalky formation; their bases black; they are curiously streaked throughout with strata of black flint; a light-house has been placed on the outer one. They were probably caused by the waves beating against the sharp cliffs of the island, and their gradual washing away is attributable to the same cause. But three of the rocks are noticeable now, the tallest one, some 120 ft. in height, having fallen into the water in 1764.

NEEF or NEEFS, Pieter the Elder, 1570–1651; b. Antwerp. His numerous architectural paintings usually represent church interiors illuminated with the glow of torches or of candles. He was distinguished for his thorough knowledge of perspective by which he was able to give great effect to a small canvas. His treatment was delicate, refined, and extraordinarily clear; he understood the harmonious modulation of colors and the power of chiaroscuro, but he generally intrusted the painting of the figures introduced into his pictures to Teniers, Franks, Breughel, and Van Thulden. His works are to be found in the galleries of Dresden, Vienna, Paris, and Gotha. His son Pieter Neefs was also a painter, but had less talent. He was a pupil of the younger Steenwijk.

NEELE, HENRY, 1798–1828; b. London; studied law while quite young, but gave up that profession, choosing rather to lead a literary life. He was a well-known poet and critic, and published *Odes and other Poems*, 1817, delivered *Lectures on Shakespeare*, 1819, and published *Dramatic and Miscellaneous Poetry*, 1823, and *Romance of English History*, in 3 vols., 1827. In the latter year he gave a course of lectures on English poets of the period from Chaucer to Cowper, which were brought out in book-form after his death, styled *Literary Remains*. He committed suicide while temporarily insane. His poems won high praise.

NEELY, HENRY ADAMS, D.D.; b. N. Y., 1830; graduated at Hobart college, 1849, and was tutor there until 1851; became assistant-rector in Calvary church (Prot. Epis.) Utica, in 1852, and, in 1854, rector of Christ church, Rochester. He married Mary Delafield in 1858, and returned to Hobart college as chaplain, 1862. He was appointed assistant to Trinity church, New York, and rector of Trinity chapel, two years later. In 1867 he was consecrated bishop of Maine.

NEEM-TREE. See MELIACEÆ.

NEEMUCH', or NIMACH, a t. of India, in the territory of Gwalior (q. v.), near the n.w. border of Malwa, 320 m. s.w. from Delhi, on a slightly elevated ridge rising from a well-cultivated plain, It is 1476 ft. above the sea. The native population is only about 4,000; but Neemuch has acquired importance on account of a British cantonment established here in 1817. Prior to the sepoy mutiny of 1857–59, the officers' quarters comprised about 80 bungalows, beautifully situated among gardens; but all, except a single bungalow, were destroyed in 1857 by the mutineers, who massacred the Europeans, and kept possession of the fort for some time, till it was captured by brig. Stuart after a siege of fourteen days. The situation of Neemuch is regarded as one of the most healthy in India; the climate is agreeable, the nights cool even in the hot season, the winter seldom so cold as to make fires requisite, and frosts very rare.

NEENAH, a village in Winnebago co., Wis.; situated on the s. side of Fox river, near the outlet of lake Winnebago; on the Milwaukee Northern, the Wisconsin Central, and the Chicago and Northwestern railroads, 90 m. n. by w. of Milwaukee. Pop. of township, '80, 588. Has a fine park, and good water power; is a favorite resort for summer travelers. Pop. of vill., '80, 4,202.

NEER, ARNOULD or AAART, VAN DER, 1619–83; b. Amsterdam; sometimes called the "moonlight painter." His usual subjects are villages with fishermen's huts along the banks of canals. He is most successful in his moonlight pieces.

NEER'WINDEN, a small village of Belgium, in the n.w. corner of the province of Liege, is celebrated in history for the great victory gained by the French under Luxembourg over the English under William III. (July 29, 1693); and also for the defeat of the French under Dumouriez by the allies under the prince of Coburg (March 18, 1793).

NEES VON ESENBECK, CHRISTIAN GOTTFRIED DANIEL, 1776–1858; b. Germany; educated at the Darmstadt gymnasium and the university of Jena. He studied medicine, after practicing which, for a short time, he was called to the chair of botany at the university of Erlangen. He was soon made president of the Leopoldine academy of naturalists, and professor of botany at Bonn, where he was one of the founders of a new botanical institution. In 1830 he accepted the posts of professor of botany and director of the botanic garden at Breslau. He took an active interest in the agitations which preceded the revolutionary movement of 1848, and was a prominent member of a Breslau religious organization named the *Kristkatholiken*, and aiming at various charitable and humanitarian purposes. He lived at Berlin for a time in 1848, participating in the democratic agitation then at its height throughout Europe. Returning to Breslau, he established a "fraternity of workingmen," with the object of diffusing education among laborers, maintaining harmony between them and their employers, etc. This society excited the hostility of the government, which ordered him to dissolve his connection with it. A prosecution was soon instituted against him for living with a woman without having been divorced from his wife. Both, this prosecution and his deposition from the chair of botany in 1852, were supposed to be due to political motives, and the distrust felt by the government for his democratic principles and influence with the laboring classes. Deprived of his salary, he had to sell his library and his collection of botanical specimens. In spite of his reformatory activity, and his researches in regard to spiritualism, in which he was a believer, he found time to continue his botanical studies, and became one of the first botanists of Europe. In his *Handbook of Botany*, 1821, he developed the theory advanced by Goethe in his *Metamorphosis of Plants*, that all the parts of the flower are only variations of the leaf. This work had been preceded by his *Fresh Water Algæ*, 1814; by *System of Fungi and Sponges*, 1816; and by *Plant Substance*, 1819, in which he was assisted by Rothe and Bischof. He published, in 1833, *Genera et Species Asterearum;* in 1836, *Systema Laurinarum;* and in 1841, *Floræ Africæ Australiaris Illustrationes Monographicæ*. In 1852 appeared the first volume of his *Universal Etymology of Nature*. He was a specialist on cryptogamous plants, and in this branch of botany his chief work is *Natural History of the European Water-Liverwort*, 1833–38.

NE EXEAT REGNO is the title of a writ issued by the court of chancery to prevent an individual leaving the kingdom, unless he gives security to abide a decree of that court. The writ was originally resorted to in cases of attempts against the safety of the state, but is now issued in cases where an equitable debt or demand is sought to be substantiated by a bill or proceeding in chancery. The writ is only granted where the party usually resides within the jurisdiction. It resembles the process which is known in the common-law courts as arresting and holding to bail, and in Scotland as arresting a person *in meditatione fugæ*.

*NE EXEAT REPUBLICA, another name for the writ *ne exeat regno* (q.v.), the word republic or state being substituted for kingdom. The writ is rarely used in the United States, and chiefly in cases involving a breach of trust or official administration. See *Supp.*, page 888.

NEFF, Felix, 1798–1829; b. at Geneva, Switzerland. He received his early education from his widowed mother, who was distinguished for piety, and had occasional lessons from some pastor of his native canton. His favorite authors in youth were Plutarch and Rousseau, and he was fond of mathematics and natural history. At an early age he was placed with a florist-gardener, and at 17 entered the army, that he might not longer be a burden to his poor mother. His excellent character and fidelity soon raised him to the rank of sergt. His strict religious principles and the purity of his life provoked the hostility of his associates, and he decided to leave the army. Being advised to enter the ministry he resigned his commission in 1819, and offered himself as a catechist or parish missionary. The first years of his missionary life were spent in the cantons of Geneva, Neufchâtel, Bern, and the Pays de Vaud. In 1821 he went to the destitute district of Grenoble in France, and afterward to Mens in Isère. Religious scruples preventing his being ordained in the established church of Geneva, and his being a foreigner rendering it impossible to obtain ordination from the Protestant church of France, he went to England, and having been ordained in 1823 by the Congregationalists he returned to Mens, the scene of his former labors. But his heart was with the destitute on the mountains, and, turning away from those by whom he was greatly beloved, he went to the high Alps, and labored with great courage and zeal among the descendants of the Vaudois in the wild picturesque valleys of Queyras and Freyssinières. Here he preached, organized schools, dedicated churches, laboring incessantly among those lonely glens and dreary mountains. His pastoral work was performed in a poor Alpine district, comprising 17 isolated villages within a circuit of 80 miles. In one part of his parish the people were so degraded as to be scarcely removed from the condition of barbarians. As they needed education and were unable to pay a teacher, he became school-master as well as preacher. They became so much interested that they built a school-house, he directing the workmen and acting himself as architect and mason. Exhausted by these labors he visited the baths of Plombières, but returned to Geneva without permanent benefit. Companies of the poor people of the Alpine valleys made long journeys on foot through the snow to see their beloved dying pastor.

NEGAPATAM', a t. of British India, in the presidency of Madras, and district of Tanjore, 124 m. s.s.w. from Madras, on a small estuary of one of the many small southern mouths of the Cauvery. The manufacture of cotton and silk fabrics was, in former times, extensively carried on here, but has greatly declined in consequence of the cheapness of British goods. A chief branch of industry is the expression of oil from the cocoa-nut and from oil-seeds. There is a considerable trade with Ceylon. The harbor is suited only for small coasting-vessels; but measures are in progress for its improvement. Negapatam is a terminus of the Great Southern railway of India. It was the capital of the Dutch possessions in India, but was taken by the British in 1781. Pop. '71, 48,525.

NEGATIVE, in photography, is that kind of photographic picture in which the lights and shadows of the natural object are transposed; the high lights being black, and the deep shadows transparent, or nearly so. Negatives are taken on glass and paper by various processes, and should indicate with extreme delicacy, and in reverse order, the various gradations of light and shade which occur in a landscape or portrait. A negative differs from a positive inasmuch as in the latter case it is required to produce a deposit of pure metallic silver to be viewed by *reflected* light; while in the latter, density to *transmitted* light is the chief desideratum; accordingly inorganic reducing and retarding agents are employed in the development of a positive, while those of organic origin are used in the production of a negative. Adopting the collodion process (which has almost completely replaced every other) as a type of the rest, the conditions best adapted for securing a good negative may be briefly indicated, leaving it to the reader to apply the principles involved to any process he may desire to practice.

The possession of a good lens and camera being taken for granted, and favorable conditions of well-directed light being secured, all that is necessary is to establish a proper and harmonious relation between the collodion bath, developer, and time of exposure. A recently iodized collodion will generally be tolerably neutral, in which case, if the developer be at all strong, and the weather warm, the bath should be decidedly acid, or *fogging* will be the result. Should the collodion, however, be red with free iodine, a mere trace of acid in the bath will suffice, while the development may be much prolonged, even in warm weather, without fogging. If the simple fact

be borne in mind that the presence of acid, either in the bath collodion or developer, retards the reducing action of the developer, it will suffice to guide the operator in many difficulties. The value of a negative consists in the power it gives of multiplying positive proofs. See POSITIVE PRINTING; also PHOTOGRAPHY.

NEGATIVE QUANTITIES are generally defined as quantities the opposite of "positive" or "numerical" quantities, and form the first and great point of difference between algebra as a separate science and arithmetic. In the oldest treatises on algebra they are recognized as distinct modifications of quantity, and existing apart from, and independent of, positive quantity. In later times, this opinion was vigorously combated by many mathematicians, among whom Vieta occupied a prominent place; but the more eminent analysts retained the old opinion. Newton and Euler distinctly assert the existence of negative quantities as quantities less than zero, and the latter supports his opinion by the well-known illustration of a man who has no property, and is £50 in debt, to whom £50 requires to be given in order that he may have nothing. After all, this discussion is little more than a verbal quibble, though interesting from the prominent position it for a long time held. It had its rise in the difficulty of satisfying the requirements of a constantly progressing science by the use of signs and forms retaining their original limited signification. It was soon felt that the limited interpretation must be given up; and accordingly an extension of signification was allowed to signs and modes of operation. + and −, which were formerly considered as merely symbols of the arithmetical operations of addition and subtraction, were now considered as "general cumulative symbols, the reverse of each other," and could signify gain and loss, upward and downward, right and left, same and opposite, to and from, etc. Applying this extended interpretation of signs to a quantity such as −4, we obtain at once a true idea of a negative quantity; for if +4 signifies 4 in. *above* a certain level, −4 signifies 4 in. *below* that level, and therefore, though a positive quantity in itself (a negative being, strictly speaking, an impossible existence), it may be fairly considered to be less than zero, as it expresses a quantity less by 4 than 0 inches above the level. Keeping this idea in view it has been conventionally agreed to admit the existence of negative quantities as existing *per se*. The only errors which can flow from this arise from misinterpretation of results, for the four fundamental operations of addition, subtraction, multiplication, and division are unaffected by the extended interpretation of signs. The following is an illustration of the value of an extended interpretation of the negative sign, showing at the same time how much more general are the ideas conveyed by algebraic expressions than by ordinary language: If at the present time a father is 50 years, and his son 20 years old, when will the father be three times as old as his son. This problem when solved, gives −5 as the number of years which must elapse before the father's age is three times the son's. Now, at first sight, this result appears to be absurd, but when we consider the terms of the problem, its explanation is easy. The question asked pointed to a number of years *to come*, and had the result turned out to be *positive*, such would have been the case, and the fact of its being negative directs us to look in a "contrary" direction, or backward to time *past;* and this is found to satisfy the problem as five years "ago" the father was 45 and his son 15.

Negative quantities arise out of the use of general symbols in subtraction, as in the formula $a - b$, where we may afterward find that b is greater than a. See SUBTRACTION.

NEGAUNEE, a village in Marquette co., Mich., 12 m. s.w. from Marquette on Iron mountain; on the Chicago and Northwestern railroad, and at the junction with the Marquette, Houghton and Ontonagon railroad; pop. '80, 3,931. Teal lake, a beautiful sheet of water, is on the n. border. It has large iron mines in which a considerable capital is invested. It has blast furnaces, a nitro-glycerine factory, banks, public schools, churches, and weekly newspapers.

NEGLEY, JAMES S., b. Penn., 1826; was a student at Western university; entered the Mexican war as a private, and at the outbreak of the rebellion enlisted within 8 days a brigade of volunteers for 3 months, and was appointed brig.gen. April 19, 1861; fought with the army of the Ohio in Alabama and Tennessee; was in command at Lavergne Oct. 7, 1862, where he defeated Anderson and Forrest; promoted to maj.gen. for his bravery at Stone river, Dec., 1862, and served in the Georgia campaign. In 1869 he was elected to congress from Pittsburg, at which city he resides.

NEGLIGENCE, in law, such want of due diligence and caution, though unaccompanied by injurious or criminal intent, as will give ground for a civil action for damages or will justify a criminal prosecution. The obligation to exercise caution may arise from a contract, express or implied, or from a rule or presumption of law; and the degree of care and caution which must be exercised varies greatly under different circumstances. The theoretical distinction between gross negligence and fraud or criminal intent is clear, but in practice it is often difficult to decide which exists in the particular circumstances. Where a contract is for any reason contrary to law, negligence in carrying out its provisions is, of course, no cause for action; and if an infant neglect to carry out a contract voidable on the score of infancy, he is not liable; though he may often be held for negligence amounting to a tort and altogether outside of contract obligations. If the negligence relate to contract, only a party to that contract can sue, whoever may be injured indirectly, while in torts it is the person receiving the actual injury who has a claim for

damages. It is not enough to constitute a valid claim that there has been a want of care; for, first, the negligent party may have been under no obligations to exercise care toward the person injured: thus, where a railway accident is brought about by the grossest negligence on the part of the company, if an individual passenger were injured who was obtaining his passage by fraud, he would have no claim, and, secondly, though the obligation might exist and negligence occur, yet it might be so slight compared with the nature of the transaction as to make it obviously unjust to hold the negligent party. Again, if the injured party has himself been negligent and has thus "contributed" to his own damage, he will have no action. This principle of "contributory negligence" is based upon public policy in part and in part upon the belief that a loss brought upon a plaintiff by his own act should not give him compensation. But it is not a good bar to an action to prove that, if the plaintiff had not done a certain act, he would not have been injured; the negligence, like that of the defendant, must have been actual, and care required of him by some legal or natural obligation. It is generally held that the burden of proof is on the defendant as to contributory negligence; that is, the plaintiff or injured party will be supposed to have acted with due care until the contrary is shown. The doctrine of contributory negligence presents many difficult questions on trial, not so much as to the law, as in determining the respective rights of the parties and the degree in which either was or both were negligent. By the common law, if death were occasioned by negligence, no action for damages could be had by the near relatives; but by an English statute and by similar enactments in most of the states of this country, suit may be brought by the administrator or executor in behalf of a husband or wife or next of kin, wherever death has been caused by negligence or wrongful act. Where the original injury has been increased by the willful act or negligence of the plaintiff, he cannot include the more remote damage in his claim. Thus, where physical injury is received and medical care is refused—the refusal resulting in permanent loss of health which would otherwise not have followed—there can be no claim for damages on that account. Every man is bound so to use his own property as not to injure another. Thus, the owner of animals which are vicious or have a contagious disease is bound to keep them under proper restraint; and the digger of a pit on his own land is liable, if it be near an unfenced highway and unprotected. Professional men are bound to exercise a fair average skill in their profession. A superior is, in general, responsible for the negligence of an agent or employee when acting in the scope of his employment, but the servant is, in turn, liable to the master. Most important decisions as to the degree of care required of railroad corporations may be seen in *Redfield on Railroads*. In general it may be said that extraordinary care is demanded of all public carriers. As to negligence by public officers in performing their official duties, see OFFICE. Three degrees of care or diligence and corresponding degrees of negligence, are usually described, apportioned to the relative circumstances and responsibilities of the parties: where one is required to use but slight care and is responsible only for gross negligence; where he is required to use ordinary care and is liable for ordinary neglect; and where he is required to use very great care and is responsible for but slight neglect. This classification is applied more especially to the subject of Bailments (q.v.). Where the bailment is for the benefit of the bailor, but slight care is required of the bailee; where the benefit is mutual, as in cases of hiring, ordinary care is required; and where the bailee is the only one who benefits by the bailment, extraordinary diligence is required and the slightest negligence will give cause for action. The exceptions to the second statement are the bailments to common-carriers and innkeepers where public policy requires that a very great degree of care should be exercised. Negligence, not coexistent with any criminal intent, may in certain cases constitute a crime. Thus, where the negligent act of one man results in the death of a second, the circumstances may make the first guilty of manslaughter. So where an officer of the law allows a prisoner to escape, not having been tampered with, but through mere carelessness, he is criminally guilty. The subject of negligence may be found treated in detail in Shearman on *Negligence*, Addison and Hilliard on *Torts*, Redfield on *Railroad Law*, and Bishop on *Criminal Law*.

NEGOTIABLE PAPER. See BILL OF EXCHANGE; EXCHANGE; *ante*.

NEGRELLI, ALOYS VON, 1799–1858; b. in the Tyrol; constructed the first Swiss railroad, from the German border to Zürich, also the first Austrian railroad, completed 1841; the Austrian Northern railroad secured him as chief inspector, which position he held till 1849, when he was appointed director of public works. In 1855 he assumed full charge of all Austrian railroads, from which position he was called, two years later, by the viceroy of Egypt, to superintend the cutting of the Suez canal, at which work he spent the last year of his life.

NEGRI'TOS, or NEGRILLOS (*Spanish*, diminutive of negroes), is the name given by the Spaniards to certain negro-like tribes inhabiting the interior of some of the Philippine islands, and differing essentially both in features and manners from the Malay inhabitants of the Eastern archipelago. They bear a very strong resemblance to the negroes of Guinea, but are much smaller in size, averaging in height not more than 4 ft. 8 in., whence their appellation of Negritos, or little negroes. They are also called by the Spaniards *Negritos del Monte*, from their inhabiting the mountainous districts for the most part; and one of the islands where they are most numerous bears the name of

Isla de los Negros. These Negritos are also known by the names Aeta, Aigta, Ite, Inapta, and Igolote, or Igorote. They are described as a short, small, but well-made and active people, the lower part of the face projecting like that of the African negroes, the hair either woolly or frizzled, and the complexion exceedingly dark, if not quite so black as that of the negroes. The Spaniards describe them as less black and less ugly than the negroes—*Menos negros y menos feos.* All writers concur in speaking of them as sunk in the lowest depths of savagedom, wandering in the woods and mountains, without any fixed dwellings, and with only a strip of bark to cover their nakedness. Their only weapons are the bow and arrow; and they live upon roots, wild fruits, and any sort of animals that they can surprise in their haunts or conquer in the chase. By the Malays they are despised and hated; and the buffalo-hunters in the woods, when they meet with them, do not scruple to shoot them down like wild beasts or game. "It has not come to my knowledge," says a Spanish writer, "that a family of these negroes ever took up their abode in a village. If the Mohammedan inhabitants make slaves of them, they will rather submit to be beaten to death than undergo any bodily fatigue; and it is impossible, either by force or persuasion, to bring them to labor." The same writer, an ecclesiastic, speaks of them as gentle and inoffensive in their manners, whenever he himself came in contact with them; and although informed that some of them were cannibals, he was not inclined to believe the report. Dr. Carl Scherzer, the historian of the circumnavigation of the *Novara,* when at Manilla, had an opportunity of seeing a Negrita girl, whom he thus describes: "This was a girl of about 12 or 14 years of age, of dwarf-like figure, with woolly hair, broad nostrils, but without the dark skin and wide everted lips which characterize the negro type. This pleasing-looking, symmetrically-formed girl had been brought up in the house of a Spaniard, apparently with the pious object of rescuing her soul from heathenism. The poor little Negrilla hardly understood her own mother-tongue, besides a very little Tagal, so that we had considerable difficulty in understanding each other.

According to Spanish statements the Negritos are found only in five of the Philippine islands—namely, Luzon, Mindoro, Panay, Negros, and Mindanao—and are estimated at about 25,000 souls. Remnants of them exist, however, in the interior of some of the other islands in the Eastern archipelago; and they are scattered, also, though in small numbers, through certain islands of Polynesia. They are altogether an island people, and are hence treated of by Prichard under the designation of Pelagian negroes. By Dr. Pickering they are treated of as a distinct race, resembling the Papuan, but differing from it in the diminutive stature, the general absence of a beard, the projecting of the lower part of the face or the inclined profile, and the exaggerated negro features. The hair, also, is more woolly than that of the Papuans, though far from equaling that of the negroes in knotty closeness. By Latham the Negritos are classified under the subdivision of Oceanic Mongolidæ, C," which subdivision is further modified by him into the designation of "Amphinesians" and "Kelænonesians." The Negritos out of the Philippine islands are found for the most part in the islands embraced under the latter designation, as New Guinea, New Ireland, Solomon's isles, Louisiade, New Caledonia, and Tasmania or Van Diemen's Land. Except in the last-mentioned island, however, the Negritos, strictly speaking—that is, the blackish people with woolly hair—do not preponderate over the other native tribes less strongly marked with negro features; while in Tasmania itself the race has almost entirely disappeared, amounting at present to not more than two or three dozen souls. Dr. Pickering is of opinion that the Negrito race "once occupied more space than it does at this time, and that it has in many instances preceded the dissemination of other races." We conclude with a description of a Negrito native of Erromango (the island where the missionary Williams was murdered), supplied to Dr. Pickering by Horatio Hales, his associate in the United States exploring expedition: "He was about 5 ft. high," says Mr. Hales, "slender and long limbed; he had close woolly hair, and retreating arched forehead, short and scanty eyebrows, and small snub nose, thick lips (especially the upper), a retreating chin, and that projection of the jaws and lower part of the face which is one of the distinctive characteristics of the negro race. . . . . Placed in a crowd of African blacks, there was nothing about him by which he could have been distinguished from the rest." See PAPUANS and POLYNESIANS.

NE'GRO, RIO. See RIO NEGRO.

NEGROES (from the Spanish word *negro*, black; Lat. *niger*) is the name given to a considerable branch of the human family possessing certain physical characteristics, which distinguish it in a very marked degree from the other branches or varieties of mankind—more especially the so-called whites or Europeans. In Blumenbach's five-fold division of mankind the negroes occupy the first place under the variety *Ethiopian*, which likewise embraces the Kaffers, Hottentots, Australians, Alforians, and Oceanic negroes. In Latham's threefold division they are placed among the *Atlantidæ*, and form the primary subdivision of *Negro Atlantidæ* in that author's classification; while in Pickering's eleven-fold division they occupy the last place in his enumeration of the races of mankind.

Both Prichard and Latham strongly protest against the common error of looking upon the term negro as synonymous with African. "It ought to be remembered," says the

Negroes —1. Shilluks (Soudan). 2. Nûer (E. Africa) negro. 3. Horas (Madagascar). 4–6. Koranas. 7–9. Basutos. 10. Zulu grave. 11. Hora woman. 12. Hottentot woman. 13. Baris (Africa) with portable smithy. 14. Bari war-dance (White Nile). 15. Street in Tamatave (Madagascar). 16. Basuto needles and case.

former, "that the word negro is not a national appellation, but denotes the ideal type constituted by the assemblage of certain physical characteristics, which is exemplified in the natives of Guinea in western Africa, and in their descendants in America and the West Indies." And Latham in like manner observes: "No fact is more necessary to be remembered than the difference between the negro and African; a fact which is well verified by reference to the map. Here the true negro area—the area occupied by men of the black skin, thick lip, depressed nose, and woolly hair—is exceedingly small; as small in proportion to the rest of the continent as the area of the district of the stunted Hyperboreans is in Asia, or that of the Laps in Europe. Without going so far as to maintain that a dark complexion is the exception rather than the rule in Africa, it may safely be said that the hue of the Arab, the Indian, and the Australian is the prevalent color. To realize this we may ask, What are the true negro districts? and what those other than negro? To the former belong the valleys of the Senegal, the Gambia, the Niger, and the intermediate rivers of the coast, parts of Sudania, and parts about Sennaar, Kordofan, and Darfúr; to the latter the whole coast of the Mediterranean, the desert, the whole of the Kaffer and Hottentot areas s. of the line, Abyssinia, and the middle and lower Nile. This leaves but little for the typical negro." Bearing in mind this limitation of the primitive area of the negro, we shall next proceed to speak of his prominent physical characteristics.

The negro has a black skin, unctuous and soft; woolly hair; thick lips; the lower part of the face prognathic, or projecting like a muzzle; the skull long and narrow; and a low, retreating forehead. The skull of the negro is remarkably solid and thick, so that in fighting they often butt against each other like rams, without much damage to either combatant; and it is likewise so flat that burdens are easily carried upon it. According to Camper's lateral admeasurement, the head of the negro shows an angle of 70°, while that of the European shows one of 80°, on which difference of 10°, as he considered, depends the superior beauty of the latter. There is not much dependence, however, to be placed on such a mode of admeasurement; and the same may be said of Blumenbach's vertical method. According to this, a considerable difference would appear to exist between the skull of the negro and that of the European. "But," says Dr. Prichard, "I have carefully examined the situation of the foraman magnum in many negro skulls; in all of them its position may be accurately described as being exactly behind the transverse line bisecting the antero-posterior diameter of the basis cranii. This is precisely the place which Owen has pointed out as the general position of the occipital hole in the human skull. In those negro skulls which have have the alveolar process very protuberant, the anterior half of the line above described is lengthened in a slight degree by this circumstance. If allowance is made for it, no difference is perceptible. The difference is in all instances extremely slight; and it is equally perceptible in heads belonging to other races of men, if we examine crania which have prominent upper jaws. If a line is let fall from the summit of the head at right angles with the plane of the basis the occipital foramen will be found to be situated immediately behind it; and this is precisely the case in negro and in European heads." There is, in fact, neither in this respect—the conformation of the negro skull—nor in any other, solid ground for the opinion hazarded by some writers, and supported either through ignorance or from interested motives by many persons—that the negro forms a connecting link between the higher order of apes and the rest of mankind. The difference is certainly considerable between the highest European and the typical negro, but the gulf between them both and the highest of the simiæ is so nearly of the same width that the difference is scarcely distinguishable. But the skin, hair, skull, lips, maxillary profile, and general facial appearance of the negro, are not the only features that distinguish him in a great degree from the European, and seem to stamp him as a distinct variety of the human race. "In the negro," says Prichard, "the bones of the leg are bent outwards. Soemmering and Lawrence have observed that the tibia and fibula in the negro are more convex in front than in Europeans; the calves of the legs are very high, so as to encroach upon the hams; the feet and hands, but particularly the former, are flat; and the os calcis, instead of being arched, is continued nearly in a straight line with the other bones of the foot, which is remarkably broad. As to the supposed excessive length of the fore-arm in the negro, a circumstance also dwelt upon as showing an approach to the anthropoid apes, facts are altogether against the statement; there being no greater difference than is observable in individuals of any other variety of mankind. In stature the negro is very much on a par with the European, often reaching 6 ft., and rarely declining below five and a half. Into the discussion as to the cause of the blackness of the skin in the negro we have not space to enter. It is generally supposed to depend upon the greater amount of pigment cells in the *rete Malpighii*, and in the greater number of cutaneous glands, as compared with the skin of Europeans. In the skin of the negro there is much oily matter, and he perspires profusely, which serves to keep him in health, while it diffuses a smell far from agreeable to bystanders whose olfactory nerves are at all sensitive. Of the hair of the negro, Dr. Prichard remarks: "I am convinced that the negro has hair properly so-called, and not wool. One difference between the hair of a negro and that of a European consists in the more curled and frizzled condition of the former. This, however, is only a difference in the degree of crispation, some European hair being likewise very crisp. Another difference is the greater quantity of coloring

matter or pigment in the hair of the negro. It is very probable that this quality is connected with the former, and is its cause, though we cannot determine in what manner one depends upon another; but as these properties vary simultaneously, and are in proportion one to another, we may infer that they do not depend upon independent causes."

The negroes, in their native seat, comprise various independent tribes, which are thus classified and enumerated by Dr. Latham: 1. *Western Negro Atlantidæ*, embracing the Woloffs, Sereres, Serawolli, Mandingos, Felups, etc.; Fantis, etc.; the Ghá, the Whidah, Maha and Benin tribes, the Grebo, etc. 2. *Central Negro Atlantidæ*, embracing the Yarriba, the Tapua, Haussa, Fulahs, Cumbri, Sungai, Kissúr, Bornú, etc.; Begharmi, Mandara, Mobba, Furians, Koldagi. 3. *Eastern Negro Atlantidæ*, embracing the Shillúk, etc.; Qámamyl, Dallas, etc.; Tibboo, Gongas. This list might, of course, be still further enlarged by reference to the works of Barth, Livingstone, Speke, and other travelers, whose researches have been published since the appearance of Dr. Latham's *Varieties of Man*, in 1850.

While these several tribes have their distinctive peculiarities, they yet bear a strong general resemblance to each other, not only in their physical appearance, but in their intellectual capacities, moral instincts, customs, and manners. The negro intellect is generally acknowledged to be inferior not only to the European, but to that of many primitive races not as yet brought within the pale of civilization, while it is superior to that of the Australians, Bushmen, and Esquimaux. Some tribes are sunk in the lowest depths of barbarism, and are either ferocious savages, or stupid, sensual, and indolent. This is the case, for the most part, according to Prichard, where the exaggerated negro type is discernible, as among the Bulloms, Papals, and other tribes on the coast of Western Guinea; also among the tribes near the slave coast, and in the bight of Benin, where the slave-trade has been carried on to the greatest extent. In other parts they show a capacity for practicing the arts of life. They are ingenious in the construction of their dwellings, they have some knowledge of the working of iron and other metals, they manufacture arms, dress and prepare the skins of animals, weave cloth, and fabricate numerous useful household utensils. Neither are they altogether deficient in a knowledge of agriculture. These marks of civilization are, for the most part, apparent in the districts either wholly or partially converted to Mohammedanism. Mungo Park, in his account of Sego, the capital of Bambarra, describes it as a city of 30,000 inhabitants, with houses of two stories high, having flat roofs, mosques in every quarter, and ferries conveying men and horses over the Niger. "The view of this extensive city," he says, "the numerous canoes upon the river, the crowded population, and the cultivated state of the surrounding country, formed altogether a prospect of civilization and magnificence which I little expected to find in the bosom of Africa." All tribes of negroes appear to be passionately fond of music, and show no little skill in the manufacture of musical instruments. They also express their hopes and fears in extemporary songs. Where Mohammedanism has not been introduced, the religion of the negroes is nothing but a debased *fetish* worship. They make fetishes of serpents, elephants' teeth, tigers' claws, and other parts of animals, at the dictation of their *fetish man*, or priest. They also manufacture idols of wood and stone, which they worship; and yet, under all this, they have some idea of a Supreme Being. They believe in good and evil spirits, and are perpetually practicing incantations to ward off the baneful influence of their spiritual enemies. Their religion, in fact, is one altogether of fear; and as this generally leads to cruelty, we find them for the most part indifferent to the sacrifice of human life. In some parts they even offer up human victims to propitiate their deities. They are cruel to their enemies and prisoners, and often shed blood for the mere savage delight they experience in seeing it flow from their victims. We need only allude to the inhuman *customs*, as they are called, of Dahomey, and the *Yam* and *Adai customs* of the Ashantees, as described by Bowdich, in support of this statement.

This same indifference to human suffering, coupled with the passion of avarice, has doubtless been the mainspring of the slave-trade carried on during so many centuries between the negroes and European traders in the western coast of Africa. Begun by the Portuguese as early as 1503, when negro slaves were first imported into the West Indies, sanctioned by Ferdinand of Aragon in 1511, and subsequently by Charles V., legalized in England under Elizabeth, and eventually practiced by every maritime nation of Europe, this infamous trade flourished under the sanction of law as late as the year 1807, when it was happily abolished by act of parliament in Great Britain, and is now treated as piracy by almost every civilized nation. Even still, however, it is practiced by lawless men, notwithstanding the humane efforts of Great Britain, France, and the United States to suppress it; and the encouragement which it has given to the petty chieftains on the slave coast, and the country behind it, to enrich themselves at the expense of their fellow-countrymen, has contributed more than anything else to retard the progress of civilization in that part of Africa. "The region mentioned," says Prichard, "has been the great seat of the exportation of negro slaves, and the tribes on the coast have been reduced to the lowest state of physical and moral degradation by the calamities and vices attendant on that traffic. Throughout negroland, and especially this part of it, the inhabitants of one district in the interior, the dwellers on one mountain, are ever on the watch to seize the wives and children of the neighboring clans, and to sell them to strangers; many sell their own. Every recess, and almost every retired

corner of the land, has been the scene of hateful rapine and slaughter, not to be excused or palliated by the spirit of warfare, but perpetrated in cold blood, and for the love of gain."

The custom of polygamy prevails among all the negro tribes, and where these are constituted into nations or kingdoms, as in Dahomey, the sovereign has often as many as two or three thousand wives, whom he occasionally disposes of as presents to his chief officers and favorites.

The languages of the various nations and tribes of negroes are very numerous. Vocabularies of nearly 200 languages have been brought from Africa by the rev. Dr. Koelle. "A slight examination of these vocabularies," says Mr. Edwin Norris, "seems to show that there are among the negro idioms a dozen or more classes of languages, differing from each other as much as the more remote Indo-Germanic languages do." To these negro idioms Dr. Krapf has given the name of *Nigro-Hamitic languages*. These may perhaps have affinities with some of the other African tongues, but not with any of the great well-defined families of languages. For further information upon this subject, we must content ourselves with referring to Dr. Prichard's *Natural History of Man*, and especially to a learned note by Mr. Edwin Norris, in vol. i. of that work, page 323.

Of the condition and prospects of the negroes in the various countries into which they have been imported during the prevalence of the slave-trade, we have scarcely room to speak. They are found in all the West India islands, to the number of about 3,000,000; in the United States, Brazil, Peru, and other parts of South America; also in the Cape de Verde islands, Arabia, Morocco, etc. In the British West India islands they were emancipated from slavery in 1834, and in those belonging to France in 1848. Indeed, slavery now exists nowhere in the West Indies, with the single exception of Cuba. In the United States the negroes amounted in 1880 to 6,577,497. Many of these were emancipated in the course of the late unhappy civil war, all the negroes of secession masters being *declared* emancipated by proclamation of president Lincoln and act of the federal congress; at the same time that indemnities were promised to such loyal states as of their own accord decreed emancipation. Negro slavery in the United States has been utterly destroyed, and the great problem which used to exercise philanthropic minds has been solved—the negro having become a United States citizen at a fearful cost of blood and treasure to both their possessors and their liberators.

NEGRO EXODUS, the name applied to a remarkable migration of freedmen from the southern states of America, in the beginning of 1879, and through that and the succeeding year. On April 7 in the year named, a memorial reached Washington, signed by many of the most influential citizens of St. Louis, Mo., including ex-senators and ex-representatives in congress, the mayor of the city, an ex-minister to Liberia, and others without distinction of party, setting forth the following facts: That during the two weeks preceding April 7 there had arrived by steamboat at St. Louis, having come up the Mississippi river, chiefly from the states of Louisiana and Mississippi, as many as 2,000 negroes, including men and women, old and young, with many of their children. That this multitude expressed an eager desire to reach Kansas; and without exception, so far as could be learned, refused all overtures or inducements to return south, even if their passage back was paid for them. That the condition of the great majority of them was that of absolute poverty; they being clothed for the most part in thin and ragged garments, and supported during their stay in St. Louis partly by public but mostly by private charity. The older ones in this migration had been formerly slaves in the south: all related the same story as to the causes of their departure from their homes—great privation and want from excessive rent exacted for land; murder of their colored neighbors; and personal violence threatened against themselves. The memorial was accompanied by affidavits given by the negroes, relating instances of political and other assassinations, and other cases of personal violence and outrage. This migration continued to flow steadily northward, and the colored people already living in Missouri and Kansas were embarrassed by the necessity imposed upon them of affording assistance to the emigrants, in which they were comparatively little aided by the white population of the north, although earnest calls by the press and by public speakers were made in all directions. By the middle of April it was publicly alleged that certain counties in Mississippi, and some river parishes in Louisiana, were being depopulated, so far as the negroes were concerned; also from interior points numbers had fled to St. Louis by rail. It appeared, on investigation, that this movement had been a matter of discussion among the negroes of the gulf states during several years, but the simultaneous character of the migration was not explicable on any general theory. Nor was the reason for selecting Kansas as the concluding point made clear. The climate of that state was so severe in the early spring that great suffering occurred among those who reached it; but neither this fact, nor the stories of hardships and dangers which were industriously circulated by those interested in opposing the movement, appeared to have the slightest effect in retarding it. It was alleged that local associations had been formed in the southern states for the purpose of encouraging migration northward. There was, however, no evidence of any united action by such associations. It was alleged, also, that the movement had been devised and executed partly in the interest of certain Kansas land speculators, and

partly by railroad companies. Mass meetings of colored people were held in New Orleans, Vicksburg, and other southern cities, during the spring of 1879, for the purpose of encouraging the negro migration; while meetings of planters and others employing negro labor were convened, at which the dissatisfied negroes were invited to state their grievances, with a view to redress, if practicable. A colored convention assembled at Nashville, Tenn., on May 7, at which delegates were present from Alabama, Arkansas, Georgia, Indiana, Illinois, Louisiana, Mississippi, Missouri, Nebraska, Ohio, Oregon, Pennsylvania, South Carolina, and Tennessee. The whole subject of the condition of the negro race in the south since the act of emancipation was considered in a report which was offered and adopted, and a plan to improve this condition was submitted. The following resolution was adopted: "Resolved, That it is the sense of this conference that the colored people should emigrate to those states and territories where they can enjoy all the rights which are guaranteed by the laws and constitution of the United States, and enforced by the executive departments of such states and territories; and we ask of the United States an appropriation of $500,000, to aid in the removal of our people from the South." By Aug. 1, more than 7,000 needy colored refugees had arrived in Kansas from the southern states, and the flow continued steadily during the summer. Public attention was diverted from it, however, and as an occasion for popular excitement it gradually died out. During 1880 but little was heard of the exodus, though the migration continued—not to Kansas alone, but to the older and more thickly settled states, and in bands of fewer numbers, thus avoiding notice.

NEGRO MINSTRELSY, a species of singing which originated among the negro slaves of the United States, and is now popular at public entertainments. The sentiment of the earlier of these negro melodies was of the most simple kind, the words mostly broken English, and the harmonies confined chiefly to two chords—the tonic and dominant. How the airs were composed has been a matter of curious inquiry. Some of them are believed to be broken down and otherwise altered old psalm-tunes, which had been caught up by the more musical of the negro race. In some instances, the singing of the melodies is accompanied with grotesque gestures; the effect being to give the idea of good-nature and love of fun in the dark-skinned minstrels. Negro melodies may be said to have been made known by Mr. D. Rice, who, first in New York, in 1831, and afterward in London, created a sensation by his singing of *Jim Crow.* Other songs followed, such as *Jim along Josey* and *Buffalo Gals;* and from less to more, there was created a very characteristically national music, if the Americans will allow us to call it so. Becoming extensively popular, and addressed to fashionable audiences, this negro minstrelsy now comprehends a large variety of songs, with airs of a pleasing kind, the whole much in advance of the original negro compositions. For these improvements, the world is indebted, among others, to Mr. E. P. Christy, who began as conductor of a band of minstrels at Buffalo in 1842, and who established himself in New York in 1846. At first his troupe were called the "Virginia Minstrels," but afterwards they were known as the "Christy Minstrels." Mr. Christy's great success in this species of entertainment brought other leaders and troupes into the field. In most cases, the members of the negro minstrel troupes are only negroes in name, with faces and hands blackened for the purpose. See *Christy's Minstrels' New Songs, with Music,* edited by J. Wade; and other similar collections.

NE'GROPONT. See EUBŒA.

NE'GROS, ISLA DE. See PHILIPPINE ISLANDS.

NEGUN'DO, a genus of trees of the natural order *aceraceæ* (see MAPLE), differing from the maples chiefly in the diœcious flowers, being destitute of petals, and in the pinnated ash-like leaves. The COMMON NEGUNDO or ASH-LEAVED MAPLE, is a native of North America, and now not unfrequent in Britain as an ornamental tree.

NE'GUS, a compound of either port or sherry wine and hot water sweetened with sugar and flavored with lemon-peel and spices. It is a favorite beverage in England, and derives its name from a col. Negus, who claimed to be the inventor.

NEHEMI'AH, son of Hachaliah, probably of royal descent, is first mentioned in the Bible as cup-bearer to Artaxerxes Longimanus in his palace at Shushan about 444 B.C. Having learned the sad fate of the returned colonists in Jerusalem, he prevailed upon the king to send him to his brethren there with full powers "to seek their welfare." For twelve years (444–432), he was untiringly engaged as "governor" in works for their safety from within and without: refortifying the city walls, notwithstanding the hindrances and dangers that beset him on all sides; inducing people from the country to take up their permanent abode in the city, thus promoting its prosperity; and finally, and above all, rekindling the flame of ancient piety and enthusiasm for the observance of the law in the hearts of the rough immigrants. He then returned to Persia, trusting to the new vitality which his reforms had, as he thought, infused into the Jewish commonwealth. But not long afterwards—within a period which it is extremely difficult now to fix—he had again to obtain leave from the king, for the purpose of abolishing the many abuses that had crept in during his brief absence from Jerusalem. His energies now were chiefly directed against the foreign elements mixed up with the people, both privately and publicly. He enforced the rigorous observation of feast and

Sabbath, and rearranged the temple service in accordance with its primeval purity, procuring at the same time the means for its proper support by inducing the people to offer the tithes as of old. His second stay at Jerusalem seems to have lasted between ten and fifteen years; but the dates, as gathered from circumstantial evidence only, are exceedingly vague. He seems to have lived to an old age, but the place and year of his death are unknown. What was the part he took in the formation and redaction of the biblical canon, cannot be investigated in this place. But there can hardly be a doubt that, among the reformatory works undertaken by him, the collection, and perhaps the edition of some of the books of the Old Testament must be included.

The book known under his name (in 13 chapters) is believed only partly his own work. Recent investigation ascribes to him only the first six chapters, part of the seventh, and the last chapter and half; the rest being a compilation by other hands. Its style and character are very simple, free from anything supernatural or prophetic. Its language resembles much that of Chronicles and Ezra, and is replete with Aramaisms and other foreign, partly Persian words. Originally considered a mere continuation of the Book of Ezra, it was by the Greeks and Latins at first called "The Second Book of Ezra." Gradually, however, it assumed its present independent position in the canon after Ezra. It is supposed to have been written or compiled towards the end of Nehemiah's life.

NEHEMIAH, BOOK OF, the latest of the historical books of the Old Testament, was in some ancient Greek and Latin versions called the second book of Ezra or Esdras. This may be accounted for by the intimate official relations between Ezra and Nehemiah, and by the similarity of the circumstances in which they acted and wrote. Without the title, "The words of Nehemiah"—prefixed to the book in modern Hebrew Bibles, and retained in the English version—its first words, "And it came to pass," might appear like a continuation of Ezra. The two books, however, contain internal marks of independent authorship; and there is no more reason to doubt that Nehemiah wrote the one than that Ezra wrote the other. Some, indeed, to prove the difference of authorship, say that Nehemiah exhibits an egotism in speaking of his own actions from which Ezra is free. But to this it is replied that Ezra, in chapters viii. and ix., adopts the same style in speaking of himself in the first person which Nehemiah at greater length employs; and that both authors were led by similar circumstances to write in a similar way. While Nehemiah was doubtless the author of the book, he evidently compiled part of it from historical sources: chapter vii. 6–73, was, as he says, copied from a register which is found also in Ezra ii. The second part, chapters viii.–x., is said to be marked by a Levitical bias, different from the rest of the book, and by the use of the third person instead of the first when speaking of Nehemiah. Hence, some critics have ascribed these chapters to Ezra or some unknown writer. But critical scholars generally consider these views without force. The third part, chapters xi.–xiii., is acknowledged by all to be chiefly, if not altogether, Nehemiah's work.

The book records: Nehemiah's sorrow over the desolations of Jerusalem and his prayer to God for the opportunity to rebuild it; the permission granted him by the king to undertake the work; his arrival at the city and survey of the ruins, followed by the rebuilding of the walls; the opposition of the Jews' enemies, and the plans by which their efforts were defeated; the complaint of the people against the oppression of the nobles, and the redress of the evil; the crafty plot of their enemies, and its defeat by Nehemiah's straightforward boldness; the record of the families that returned first from Babylon, followed by an account of the offerings made by the rich and poor towards the work; the reading of the law by Ezra the scribe, accompanied with a joyful celebration of the feast of tabernacles; the mourning, fasting, and repentance of the people, expressed by a full confession of sin and by a solemn covenant sealed by princes, priests, and Levites, and confirmed with an oath by the whole multitude of the people, to observe the law, sanctify the Sabbath, sustain the services of the temple, and bring in all the tithes; the selection by lot of a tenth of the people to dwell in Jerusalem, and the distribution of the rest through the other cities of the land; the registry of the priests and Levites, and the gathering of the latter from all parts of the land to dwell in Jerusalem; the dedication of the wall of Jerusalem, accompanied with the offering of large sacrifices and the utterance of great joy which was heard afar off; the admission of heathen strangers into the temple during Nehemiah's absence in Persia, and their summary expulsion after his return; his enforcement of the broken covenant to pay the tithes, to sanctify the Sabbath day, and to refrain from marriages with the heathen around them.

NEHLIG', VICTOR, b. Paris, 1830. His instructors in painting were Abel de Pujol, and Cogniet. After residing some time in Havana, Cuba, he removed to New York, where he gained a reputation by his pictures representing the romance and poetry of American history. In 1870 he was elected a member of the national academy of design. Among his best-known works are "Gertrude of Wyoming," "Hiawatha and Minnehaha," and "Pocahontas."

NEILGHER'RY (properly NILGIRI) **HILLS** (Skr. *nîla*, blue, and *giri*, mountain), a remarkable group of mountains in the s. of Hindustan, entirely isolated, with the exception of a precipitous granite ridge, 15 m. in width, which connects it with the high table-

land of Maisur on the north. Lat. 11°. 10′ to 11° 38′ n., long. 76° 30′ to 77° 10′. The shape of the group is that of a triangle, of which one side faces the district of Malabar on the west. Greatest length, about 40 m.; average breadth, about 15 miles. The base of the mountains is covered by a dense and unhealthy forest, swarming with wild animals, among which are the elephant and tiger; but in the higher regions of the hills wood is comparatively scanty. The surface of the group is undulating, rising, in the peak of Dodabetta, near the center, to the height of 8,760 ft., the greatest height, as yet ascertained, in India s. of the Himalayas. The hills for the most part consist of granite, covered often to the depth of upwards of 10 ft. by a richly productive black soil. There are several morasses yielding peat, which is used for fuel. The higher lands form a fine open grass country, covered with the vegetation of the temperate zone, and inhabited by a most remarkable tribe, the *Tudas* or *Toruvars* (herdsmen). This tribe numbers only about 2,000 persons. The men are tall and handsome, with Roman noses, fine teeth, and large expressive eyes; the women are singularly beautiful. Their religion is theism; they have no idols. Owing to their great elevation the Neilgherry hills have a delightfully cool climate, and are much resorted to on this account by invalided Europeans. The principal station, and the only place on the hills that deserves the name of a town, is Utakamand, situated in the center of the hills, at an elevation of 7,300 ft. above sea level. Its climate is cold and damp during the monsoon; at other times it is intensely dry, and the mean annual temperature is 58°.

NEILGHERRY NETTLE, *Girardinia Leschenaultii*, a plant of the natural order *urticeæ*, nearly allied to the true nettles, and possessing in a high degree the stinging power which is common in them. It is frequent on all the higher ranges of the Neilgherry hills. The bark yields a valuable fiber, which the natives obtain by first boiling the whole plant, to destroy its stinging properties, and then peeling the stalks. The fiber is of great delicacy and strength, and is worth £200 a ton in England. The cultivation of the plant is therefore thought likely to be remunerative.—Markham's *Travels.*

NEILL, Thomas H., b. Penn., 1825; educated at West Point, and after graduating in 1847 was assigned to the infantry. At the outbreak of the rebellion he organized the 23d Penn. vols., and commanded the regiment in the peninsular campaign of 1862. The same year he was brevetted brig.gen., and at Fredericksburg, Marye heights, and Gettysburg commanded a brigade of the 6th corps. In 1864 he was made maj. with brevet rank of maj.gen. for gallant conduct at the siege of Petersburg and battle of Winchester. At the end of the war Neill was promoted to the rank of lieut.-col., did active work in the Indian warfare, and in 1875 was made commandant of West Point. He d. 1885.

NEILSON, Lilian Adelaide. See page 888.

NEI'RA. See Moluccas.

NEIS'SÉ, a t. of Prussian Silesia, and a fortress of the second rank, is situated in a broad valley on the Neisse, an affluent of the Oder, 30 m. s.w. of Oppeln. It consists of the town proper on the right bank, of the Friedrich's town, and of the Preussen fort on the left bank. It contains two great squares, has eight Catholic and two Evangelical churches, a hospital, theater, etc. It carries on manufactures of arms, chemical products, and tobacco, and establishments for spinning and weaving are in operation. The entire pop. in 1880 was 20,507. Neissé, formerly the chief town of a principality of the same name, and the residence of a prince-bishop, has frequently been the scene of conflict.

NEJIN′, an ancient t. of Little Russia, in the government of Tchernigof, on the Oster, an affluent of the Dnieper, about 80 m. n.e. of Kiev. It fell into the hands of the Lithuanians in 1320, and of the Poles in 1386, but was annexed to Russia in 1654. Nejin is an industrious town of (1880) 21,590 inhabitants, many of whom are descendants of Greek immigrants who settled here in the reign of Catharine II. The principal branch of industry is the cultivation of tobacco. Great quantities of leaf tobacco are sent hence to St. Petersburg, Riga, and Mittau. The chief institutions are 2 monasteries, 25 churches, and a lyceum.

NÉLATON′, Auguste, 1807–73; b. Paris; studied with Dupuytren, graduated in medicine in 1836, practiced surgery in several hospitals, and was adjunct professor of the faculty of Paris from 1839 to 1851, and professor of clinical surgery till 1867; became a senator in 1868; was member of the academy, and surgeon to Napoleon III.; made several improvements in surgery, one of which was for the extraction of stone of the bladder. A probe, having an unpolished porcelain knob at its end, much used in military surgery for reaching for lead bullets, is called Nelaton's probe. In conjunction with Velpeau he published *Rapport sur la Progrès de la Chirurgie* in 1867; but his principal work is *Elémens de Pathologie Chirurgicale,* in 5 vols. 2d ed., 1867–70.

NE'LIGH, a village in Nebraska, in Antelope co. and on the Elkhorn river. It contains several mills and stores, a post-office and hotel. Pop. 1880, 326.

NELLORE′, a t. of British India, capital of a district of the same name, in the presidency of Madras, situated on an elevation on the right bank of the northern Pennar, 20 m. from its mouth, and 95 m. n.n.w. from Madras. It is irregularly built, and the population in some places much crowded; but there are some good streets. The abundant supply of water contributes to the health of the town. Nellore was formerly an important fortress. It is a curious circumstance that, in the end of last century, a pot filled

with Roman gold coins and medals—chiefly of Trajan, Adrian, and Faustina—was found under the ruins of a small Hindu temple at Nellore. Pop. '71, 29,922.

NELSON, a co. in central Kentucky, traversed by the Great Southern and the Louisville and Nashville railroads; drained by Salt river. Pop. 66,609—4,716 colored. The surface is slightly hilly and largely covered with forests, the soil fertile, good limestone being found in several parts. The principal products are lumber, grain, wool, and live stock. It has numerous saw-mills, 3 flour-mills, and 8 distilleries. Co. seat, Bardstown.

NELSON, a co. in central Virginia, extending from the Blue ridge on the n.w. to the James river on the s.e., and drained by the Tye and Rock rivers and Rockfish creek; crossed by the Washington City, Virginia Midland and Great Southern, and the Atlantic, Mississippi and Ohio railroads; and intersected by a canal leading to Richmond; 340 sq.m.; pop. '80, 16,535—7,512 colored. The soil is fertile, and the surface undulating, in some parts being covered with extensive forests. Wheat, Indian corn, oats, and tobacco are the leading products. Co. seat, Lovingston.

NELSON, the capital of a province of the same name, in New Zealand, is situated at the n. end of South island, at the mouth of the Maitai, a small river, and at the head of a large bay called Blind bay. The situation is very beautiful, on a flat, hemmed in by rugged hills and amidst almost tropical luxuriance. The harbor, however, only admits vessels of 500 tons at high water, and this circumstance has much retarded the progress both of the town and the settlement. The center of the town is a hill rising 40 ft. above the surrounding streets, and laid out as a square with an Episcopal church in its center. Nelson is the seat of a bishop. The city was founded in 1841. Pop. '81, 6,764; with suburbs (1881) about 10,000. Three newspapers are published here. The manufactures of the town comprise cloth and leather.

NELSON, David, 1793–1844; b. Tenn.; graduated at Washington college, Va.; studied medicine in Danville, Ky., and in the Philadelphia medical school; returned to Kentucky at the age of 19, intending to practice his profession, but the war of 1812 having commenced, he joined a Kentucky regiment as a surgeon, and went to Canada. Returning he came near losing his life from hunger and fatigue, but was found and saved by his relative, col. Allen. He resumed his medical practice at Jonesborough, his native town. Religiously educated, he had early made a profession of religion, but while in the army he became an infidel. He soon, however, became convinced of the truth of the Bible, and determined to enter the ministry. He was licensed to preach in April, 1825. He preached three years in Tennessee, and published also at Rogersville the *Calvinistic Magazine.* In 1828 he succeeded his brother Samuel as pastor of the Presbyterian church in Danville, Ky. In 1830 he removed to Missouri and established Marion college, near Palmyra, of which he was the first president. Earnestly advocating the cause of emancipation he found it expedient to leave Missouri, and in 1836 he removed to Illinois, where he established at Oakland, near Quincy, a school for the education of young men for the ministry. He exhausted his pecuniary means and the institution failed. In 1836 he published a work of great interest—*Cause and Cure of Infidelity*—which had an extensive circulation and passed through several editions in America and England. He wrote a work entitled *Wealth and Honor,* but the manuscript was lost in passing from his hands. He wrote articles on missions, baptism, etc., for the *New York Observer* and other public journals.

NELSON, Horatio, the greatest of Britain's admirals, was b. on Sept. 29, 1758, at Burnham Thorpe, Norfolk, of which place his father, Edmund Nelson, was rector. His mother's maiden name was Suckling, and through her he could claim a collateral kinship with the celebrated sir Robert Walpole. As a child he was feeble and sickly; and throughout life his small, frail, and attenuated frame seemed to consort but poorly with the daring and impetuous spirit which "stirred and lifted him to high attempts." At the age of 13 he entered the royal navy, commencing his career in the *Raisonnable,* 64 guns, commanded by his uncle, capt. Suckling. Then, even more than now, promotion in the first stages of the profession was determined by admiralty interest; and fortunately for him and for England, his uncle, shortly afterward becoming comptroller of the navy, was able to facilitate his rise. His promotion was nearly as rapid as it could be, and before he was quite 21 he had attained the rank of post-captain, which fairly opened the way for him to the higher honors of the service. Up to this time no opportunity had been afforded him of achieving any marked distinction, but to all who were brought into contact with him he had already approved himself a bold and capable officer. Henceforward, for some years, he was nearly constantly employed in a variety of harassing services; and in all, his conduct was such that in no long time he had made for himself a brilliant reputation. His growing fame was as yet, however, chiefly confined to professional circles, no very signal exploit having brought his name prominently before the public. But with the advent of the war with revolutionary France the time had come when he was to "flame amazement" on the world by a series of noble deeds, in the luster of which all other naval glory looks pale. In his obscurer years, he seems to have been cheered under what pained him as unmerited neglect by that prescience of a grand destiny, which has so often preluded to a career of exceptional splendor. Thus, on one

occasion, he writes: "They have not done me justice. But never mind. One day I'll have a gazette of my own." And subsequently the same confidence is expressed with something like the depth of a religious conviction: "One day or other I will have a long gazette to myself. I *feel* that such an opportunity will be given me. I cannot, if I am in the field of glory, be kept out of sight; wherever there is anything to be done, *there Providence is sure to direct my steps.*" In 1793 appointed to the *Agamemnon,* 64 guns, he took a distinguished part, among other services, in the sieges of Bastia and Calvi, in Corsica, losing an eye at the last of these; and in the celebrated actiou of sir John Jervis off cape St. Vincent with the Spanish fleet, to a maneuver of extreme and masterly daring, executed by Nelson in defiance of orders, that officer was mainly indebted for the splendid success obtained, and the peerage with which it was rewarded. Though in the interval an expedition which he commanded against Teneriffe had failed disastrously, with loss to himself of his right arm in the assault, it was on all hands admitted that everything was done on the occasion which skill and valor in their highest combination could effect, and Nelson on his return to England in 1797, was received with general acclamation. He was invested with the order of the bath, and a pension of £1000 a year was voted to him. Being next year intrusted with a fleet, he signalized this his first independent command of any magnitude by the stupendous victory of the Nile, memorable in naval annals as the completest annihilation of an enemy on record. See ABOUKIR. Finding the French fleet—to which his own was considerably inferior in force—skillfully moored so as to defy ordinary attack, he adopted the novel expedient of doubling on the enemy's ships, and was rewarded with success the most consummate. Of the French line of battle, two ships only escaped to be afterward captured; and it was considered that solely to a wound in the head, which in the heat of the action prostrated Nelson, did even these owe their temporary safety. Honors were now from all quarters showered upon him; and in particular the gratitude and enthusiasm of his countrymen were signified by the title bestowed on him of baron Nelson of the Nile, and a grant of £2000 a year for his own life, and the lives of his two immediate successors. For his services immediately subsequent, in effecting the expulsion of the French from Naples, the Neapolitan king rewarded him with the dukedom of Bronte and a domain of £3000 a year. These last honors, however, were in one sense dearly purchased. The single suspicion of a blot on his public fame is in regard of his relations with the corrupt court of Naples, and of certain questionable acts into which by these he was led. The only flaw in his private character was his infatuated attachment to lady Hamilton, the wife of the English ambassador, a woman of questionable antecedents, but perilous fascination, with whom he was here thrown in contact. The influence which she now obtained over him, she continued to the end to exercise. Early in life he had married, and married happily. If to the charms of an impure adventuress he sacrificed, on his return to England, the wife to whom before he had been tenderly devoted, it is not necessary to indulge in comment. Let us compassionate the one cruel frailty of a man in all else and in his proper nature, as gentle and generous as he was brave.

His next magnificent exploit was the battle of Copenhagen in 1801, in which. after a struggle of terrible severity, he shattered the naval power of Denmark, and along with it the dreaded coalition against England of the three northern kingdoms. Never were the characteristic and heroic qualities of the man more brilliantly displayed than on this most trying occasion. In the moral courage to accept responsibility at all hazards, no man ever surpassed him. In the heat of the battle, his chief, sir Hyde Parker, in deadly anxiety as to the issue of what at a distance seemed to be a hopeless conflict, signaled him to discontinue action. "Damn the signal!" said Nelson, when this was reported to him. "*Keep mine for closer battle flying.* That's the way I answer such signals. Nail mine to the mast." And with the certainty of professional disgrace and ruin staring him in the face in case of failure, he worked out his grand triumph.

Had Nelson's services here ceased, his fame would still have been assured as the greatest of England's naval heroes. But a crowning glory awaited him. In the earlier part of 1805, glowing with fierce ardor and impatience, he had chased half round the world a French fleet of nearly double the force of his own, scared by the very terror of his name; and on the morning of the memorable Oct. 21 of that year, the desire of his eyes was satisfied, when in the bay of Trafalgar he saw before him the combined navies of France and Spain moving to meet him in frank fight. Of the glorious consummation which followed we need not speak in detail. Ere night, the power of France upon the seas was annihilated, and her threatened invasion of England had become an abortive dream. But Nelson was no more. He died as such men wish to die, amid the thunders of his mightiest victory.

The character of Nelson was, for a man of his greatness, unusually simple and transparent. A more absolute singleness of aim and aspiration than his it is difficult even to conceive of. Literally on fire with that ardor and passion of enthusiasm without some tincture of which scarce any man perhaps has ever yet achieved distinction, he was driven by it imperiously in one direction. The greatest of sailors—he was a sailor and little else. Of his genius for command it would be idle at large to speak. In coolness, foresight, promptitude, instant intuitive decision, and a daring which, even when it seemed at times to touch temerity, was yet regulated throughout by the nicest calculations of reason, he has perhaps never been quite equaled on the element. His nature

was most noble and humane. His heart was as soft as a woman's, and overflowed with all liberal generosities. He had but to be known to be beloved; and of the tender chivalry of his relations with his gallant brethren in arms it is touching to read.

NELSON, Samuel, ll.d., 1792–1873; b. N. Y.; educated at Middlebury college, and admitted to the bar in 1817. He was a presidential elector for New York in 1820, and a circuit judge 1823–31. In 1844 he was appointed an associate justice of the state supreme court, which office he retained till 1872. He was a member of the N. Y. constitutional convention in 1846, and of the joint high commission for the settlement of the Alabama claims in 1871.

NELSON, Thomas, 1738–89; b. Va.; son of William Nelson, president of the Virginia colonial council. He was educated at Trinity college, Cambridge, England. Returning to this country in 1761, he took up his residence at Yorktown on the family estates. In the disputes with Great Britain he warmly advocated the colonial cause, both privately and in the house of burgesses. He served in the first provincial convention of 1774, and in the second of 1775. In the latter year he became col. of the 2d Va. regiment, but resigned in 1776 upon his election to the constitutional convention. In this body he introduced a resolution instructing the Va. congressional delegation to bring before congress proposals for a declaration of independence. He was elected to congress in time to sign the declaration, but resigned in May, 1777, on account of ill-health. In August of the same year, when a British squadron under admiral Howe was off the Virginia coast, he became commander-in-chief of the state troops, and soon after, at the call of congress, led a cavalry battalion to Philadelphia. After the alarm occasioned by the approach of Howe had subsided, he returned to the legislature, where he resisted the proposed confiscation of British property, maintaining that it was unjust to make private persons suffer for public wrongs. Early in 1779 he was again a member of congress, and was again forced by ill-health to resign. In May the same year, he organized the state militia, for protection against a British foraging and plundering expedition then invading Virginia. In 1780, when congress had asked for contributions to pay for the expenses of the French contingent, Virginia attempted to raise a loan of $2,000,000. In the depreciated condition of the public credit, there was little hope of negotiating that sum, but a large amount was advanced by Nelson, who made himself personally responsible. He also paid two Virginia regiments, which had refused to go south till they had received the arrearages of their pay. In 1781 he succeeded Jefferson as governor. The British were ravaging the state, and Nelson opposed them with what militia he could muster. He was forced to exercise extra legal powers, but his acts were afterward sanctioned by the legislature. In command of the state militia at the siege of Yorktown, he ordered the bombardment of his own house, the most valuable in the town. He was already financially embarrassed by his loans to the government, and in his last days his property was sold to pay his debts. He resigned in Nov., 1781.

NELSON, William, 1825–62; b. Ky.; brother of Thomas Henry, minister to Chili 1861–66; joined the navy in 1840, and in 1847 commanded a battery in the fleet which bombarded Vera Cruz, keeping up a continuous cannonade and seconding the movements of the army under Scott, resulting in the capture of the city and fort. He served in the Mediterranean and south Pacific, and in 1854 was promoted to master, in 1855 to lieut. In 1858, when the slave ship *Echo* was required to discharge her cargo of negroes into the keeping of the *Niagara*, for the purpose of restoring them to African soil, he was ordered to the latter vessel. In 1861 he was on ordnance duty at Washington, and at the outbreak of the rebellion he was placed in command of the gunboats on the Ohio, with the rank of lieut.commander. Soon after, he left the navy, and entering the military service, was ordered to Kentucky. He there established recruiting stations, and organized camp "Dick Robinson," near Danville, and a similar rendezvous at Washington, in Mason county He was promoted to brig.gen. Sept. 1861. At the battle of Shiloh, April, 1862, he commanded the 2d division under gen. Buell, whose forces united with gen. Grant's were attacked by the confederate gen. Beauregard. He was wounded at the battle of Richmond, Ky. In 1862, when Louisville was threatened with an attack of the confederates under gen. Bragg, he commanded the union forces, ordered earthworks to be constructed, pressing private citizens into the service, and defending the position until the arrival of gen. Buell with the army. In 1862 he was commissioned maj.gen. of volunteers, and in September was fatally shot at the Galt house, Louisville, by the union gen. Jefferson C. Davis of Indiana, in a personal quarrel.

NELSON, Wolfred, 1792–1863; b. Montreal; son of an English officer; in 1811 he began the practice of medicine in St. Denis. In the war with the United States, 1812, he served as surgeon. He was chosen representative of Sorel in the Canadian parliament of 1827. In the revolution of 1837 he was prominent, and was in command at the victory obtained by the insurgents at St. Denis, on the Richelieu river, but was captured and sent to Bermuda as an exile. In the next year he settled at Plattsburg, N. Y., and in 1842 returned to Montreal, a general amnesty having been declared. He was again elected to parliament from his former district in 1844 and 1845, and in 1851 was made inspector of prisons, a position which he held for several years. He served as mayor of

Montreal two terms and was at the head of the Lower Canada college of physicians and surgeons.

NELSON RIVER, British North America, rising in the n. extremity of lake Winnipeg in the North-West territory, a branch of the Saskatchawan, after passing through a number of lakes runs n.e. into Hudson's bay, where it is sometimes called Katchawan. It is deep, wide, and swift, and in its course makes many abrupt turns, and has many rapids and falls that render it almost unnavigable. That part of the area e. of the lake of the Woods and lake Winnipeg, is a rough country with a soil of Laurentian formation except for 100 m. of the river's course through the Silurian plain of Hudson's bay. In the former region one-quarter is arable land, about one-half is too cold for cultivation, and about 70,000 sq.m. of timber constitute the remainder. The area of its basin is 432,000 sq.miles. West of lake Winnipeg it traverses a fertile country adapted to wheat culture. Its length to the head of the south fork of the Saskatchawan is 1732 m., and at its mouth is York, a town and fort, one of the principal trading-posts of the Hudson's bay fur company.

NELUM'BO, *Nelumbium,* a genus of aquatic plants similar to water-lilies, and often included under that name, as well as by some botanists in the natural order *nymphæaceæ* (q.v.); although by others constituted into a distinct order, *nelumbiaceæ,* differing in the want of albumen in the seed, and in the distinct carpels, which are one-seeded, and buried in the cavities of a large fleshy receptacle; which eventually becomes a broad hard bed, full of holes, with the large seeds half buried in them. The flowers and leaves are very similar to those of water-lilies. The species are few, and are found in the warm parts of Asia, in the n. of Africa, and in North America. They are all distinguished by the beauty of their flowers. *N. speciosum* is the EGYPTIAN BEAN of Pythagoras, the *lotus* (q.v.) of the Hindus, held sacred by them and by the people of Thibet. It is also much esteemed and cultivated in China, and elsewhere in the e.; for its seeds, roots, leaf-stalks, and flower-stalks, all of which are eaten. It has been used as food by the Egyptians from remote antiquity. The seeds are in size and shape like acorns, with a taste more delicate that that of almonds. The root contains much starch, and *Chinese arrowroot* is said to be obtained from it. Slices of it are often served up at table in China. Great quantities are pickled with salt and vinegar, and eaten with rice. The powdered root makes excellent soup with water or milk. The flowers are generally rose-colored, seldom white. The ancient Egyptian mode of sowing this plant, by inclosing each seed in a ball of clay and throwing it into the water, is practiced at the present day in India.—*N. luteum* is a North American species, extending almost as far north as Philadelphia; with yellow flowers. The seeds are sought after by children and by Indians, and the farinaceous roots are agreeable when boiled.

NE'MAHA, a co. in n.e. Kansas, having the state line of Nebraska for its n. boundary, drained by the Nemaha and Delaware rivers and by Vermilion creek; 720 sq.m.; pop. '80, 12,463—10,727 of American birth, 75 colored. It is intersected in the s. by the central branch of the Union Pacific railroad and centrally by the St. Joseph and Denver City railroad. Its surface is somewhat hilly and its soil is very fertile, producing large crops of wheat, corn, oats, potatoes, and dairy products. It is a fine country for stock-raising, and its rivers furnish excellent water-power. Its mineral products are limestone, much used for building-purposes, sandstone, coal, and gypsum. It has for that section a good supply of timber, appearing along the streams, and on the bluffs, in groves of oak, hickory, walnut, and cotton-wood. Co. seat, Seneca Court House.

NE'MAHA, a co. in s.e. Nebraska, having the Missouri river for its e. boundary separating it from Missouri; intersected by the Nebraska railway in the s. and centrally by the Brownville to Aurora branch; 420 sq.m.; pop. '80, 10,451—9,256 of American birth. Its surface is hilly and drained by the Little Nemaha river, Muddy creek, and other small streams. A large proportion is prairie land with groves of ash, elm, cotton-wood, and hickory, which grow along the river bottoms where the soil is fertile, having a limestone foundation, and producing the staple products of the western states. It is eminently fitted for stock-raising. Limestone, found in abundance, is used for building-purposes, and coal is mined. Co. seat, Brownville.

NEMATEL'MIA (derived from the Gr. words *nema* a thread, and *helmins,* an intestinal worm), is the term given by recent zoologists to a large and important class of the subdivision *vermes* of the *articulata.* The worms belonging to this class are of a more or less elongated cylindrical form. Their skin is thick and strong, and is usually wrinkled in such a manner as to give the body an annulated appearance, which, however, disappears if the animal is placed in water. The nervous system in the higher forms (as the *ascarida*) consists of two lateral ganglia at the anterior extremity, which are united by a slender nervous ring, and from which two lateral nervous trunks proceed to the posterior part of the body; while in the lower forms no distinct nervous system can be recognized. No special organs of the senses are met with; but a general sense of touch is probably present. The digestive organs are extremely simple. In one order (the *acanthocephala*) no trace of an intestinal canal can be detected; in another order (the *gordiacea*), there is a mouth, but no anus; while the higher forms are provided with mouth, intestinal canal, and anus. In the higher forms, a kind of vascular system is developed in the skin, in

the shape of canals, in which the nutrient fluid is propelled by the movements of the body. No distinct respiratory organs can be detected; but in some genera there are glands whose object is not clearly known. These worms are uninsexual; but the males are comparatively rarely found, and are always smaller than the females. With the exception of two families—the *urolabea* and *anguillulidæ*, or paste and vinegar eels—all the animals of this class are parasitic; indeed, Carus, in his *Handbuch der Zoologie* (1863), vol. ii. p. 458, goes so far as to say that "probably all the nematelmia live as parasites, either during their whole lives or during certain stages of their existence."

The nematelmia are sometimes termed *round-worms*, just as the platyelmia (tape-worms, flukes, etc.) are called *flat-worms*. Most commonly, however, the term round-worm is restricted to the *ascaris lumbricoides*, the most common of the human entozoa.

This class is divisible into three very distinct orders—viz., the *acanthocephala*, which are destitute of an intestinal canal; the *gordiacea*, which possess an intestinal canal, but no anus; and the *nematoidea*, which possess a perfect intestinal canal, provided with two orifices.

NEMATOI'DEA constitute the highest order of the nematelmia, and indeed of intestinal worms generally, inasmuch as they present a distinct nervous system, a complete intestine provided with mouth and anus, and distinct sexual organs. The history of their development is not fully known; but there is no reason to believe that these animals undergo any remarkable metamorphoses, although some perforate the intestinal walls, and become encysted in parenchymatous organs. The great majority of the nematoidea are parasitic. The nematoidea are divided by Carus into twelve families, all the members of which are known only in a parasitic state of existence, excepting certain genera of the first and second family.

Although the intestinal canal is the most common residence of these worms, some, as *trichina spiralis*, are found chiefly in the muscles; others, as *filaria medinensis*, in the subcutaneous cellular tissue, and others in the kidneys, lungs, etc. See ENTOZOA. For further information regarding these worms, the reader is referred to Eberth's *Untersuchungen uber Nematoden* (4to, 1863).

NE'MEA, anciently the name of a deep and well-watered valley of Argolis, in the Peloponnesus, between Cleonæ and Phlius. It lies n. and s., and is from 2 to 3 m. long, and more than half a mile broad. It possessed a sacred grove, with a magnificent temple of Zeus, and was celebrated for the games called the *Nemean games*, which took place four times in two olympiads in an adjacent woody valley. This was one of the great national festivals of the Greeks, and, according to one legend, was founded by the seven princes who were combined against Thebes: according to another, by Hercules after his victory over the Nemean lion. The games consisted partly of exercises of bodily skill and strength—such as chariot-racing, quoit-throwing, wrestling, running in armor, horse-racing, boxing, throwing the spear, and archery, and partly of musical and poetical competitions. The prize was originally a crown of olive twigs, afterwards of parsley. We have eleven odes by Pindar in honor of victors in the Nemean games.

NEMER'TĒS, a genus of marine *annelida*, the type of a family, *nemertidæ*, remarkable for the prodigious length which some of the species attain, which, in their most extended state, is 30 or 40 feet. But the animal which stretches itself out to this length, is capable of suddenly contracting itself to 3 or 4 feet. The structure is similar to that of leeches, but there is no sucker. These annelids feed upon molluscs by sucking them out of their shells. They generally lurk in the mud or sand of the sea-coast, and are sometimes drawn up with the nets or lines of fishermen. They twine themselves into knots and coils, apparently inextricable, but without any real entanglement. The life history of the *nemertidæ* is curious. The embryo has at first a ciliated, non-contractile, oval body; from which there issues a small actively contractile worm, leaving behind it the oval skin, and this worm grows to the size already mentioned. The larval state, however, exhibits a cleft with raised edges, which becomes the mouth of the perfect animal.

NEMESIA'NUS, MARCUS AURELIUS OLYMPIUS, b. about the middle of the 3d c., probably in Africa. He wrote four eclogues, and a poem on hunting.

NEM'ESIS, according to Hesiod, the daughter of Night, was originally the personification of the moral feeling of right and a just fear of criminal actions—in other words, of the conscience. Afterwards, when an enlarged experience convinced men that a divine will found room for its activity amid the little occurrences of human life, Nemesis came to be regarded as the power who constantly preserves or restores the moral equilibrium of earthly affairs—preventing mortals from reaching that excessive prosperity which would lead them to forget the reverence due to the immortal gods, or visiting them with wholesome calamities in the midst of their happiness. Hence originated the latest and loftiest conception of Nemesis, as the being to whom was intrusted the execution of the decrees of a strict retributive providence—the awful and mysterious avenger of wrong, who punishes and humbles haughty evil-doers in particular. Nemesis was thus regarded as allied to Até (q.v.) and the Eumenides (q.v.). She was sometimes called Adrastēa and Rhanmusia, the latter designation being derived from Rhanmus, a village of Attica, where she had a temple. She was represented in the older times as a young virgin, resembling Venus; in later times, as clothed with the tunic and pep-

lus, sometimes with swords in her hands and a wheel at her foot, a griffin also having his right paw upon the wheel; sometimes in a chariot drawn by griffins. Nemesis is a frequent figure on coins and gems.

NEME'SIUS, b. Syria about the middle of the 4th c.; bishop of Emessa in the reign of Theodosius the great, though the time is uncertain, and little is known about his life. He left a treatise in Greek on *The Nature of Man*, which treats of the soul and body. The observations and theories of Nemesius on the latter subject show considerable ingenuity and learning. His description of the glands, nerves, and spleen show him to have been thoroughly acquainted with the physiological learning of his time; and, in regard to the motion of the pulse and the object of the bile, have given rise to the supposition that he was acquainted with the circulation of the blood and the functions of the bile and liver. In regard to the motion of the pulse, he says: "It takes its rise from the heart, and chiefly from the left ventricle of it; the artery is with great vehemence dilated and contracted, by a sort of constant harmony and order. While it is dilated, it draws with force the thinner part of the blood from the next veins." The soul was considered by Nemesius as formed of two parts: the rational part, composed of will, memory, and thought; and the irrational part, consisting of the passions and desires. He believed in the Platonic teaching as to the pre-existence of the soul.

NEMI, a lake in Italy, having on its margin a temple of Diana famous among antiquities. It was called Speculum Dianæ, mirror of Diana, and is now known as Lago di Nemi. It is 17 m. s.e. of Rome. The ancient estimate of the distance from the temple to La Riccia (their Aricia), a city of Latium, is 3 m.; and the place was celebrated throughout Italy on account of its sacred temple, grove and lake, and given the surname of Nemoralis. The n.e. margin is the site of the ancient town of Nemus now occupied by the village of Nemi overlooked by a feudal castle. It is less than 6 m. in circumference, lying between lake Albano and the town of Velletri, on the Appian Way, in the midst of steep high hills, embowered in trees, once peopled with votaries of Diana. It fills the crater of an extinct volcano and has no known outlet except a passage made by the ancients which still serves its original purpose. It is a favorite resort for tourists and artists.

NEMOURS, Louis Charles Philippe Raphael d'Orléans, Duc de, b. Paris 1814; 2nd son of Louis Philippe. In 1831 he was elected king of the Belgians, but declined, as he did a subsequent offer of the throne of Greece. He served in the two Belgian campaigns, and in Algeria, and was made lieut.general. After the death of his elder brother, the duc d'Orléans, a bill was passed conferring the regency upon the duc de Nemours; but it was not sanctioned by public opinion, and he left France in 1848, and did not return till 1870. He married in 1840 Victoire-Auguste-Antoinette, duchess of Saxe-Coburg, by whom he has 2 sons and 2 daughters.

NE'NAGH, a market t. of Tipperary co., Ireland, distant 95 m. s.w. from Dublin; pop. '81, 5,421, of whom the Roman Catholics were twelve times as many as the Protestants of the Episcopalian church, and there were fifty or sixty Protestants of other denominations. Nenagh is the assize town of the North Riding of Tipperary, and is a place of more than ordinary pretensions in its public buildings. The ancient keep, called Nenagh Round, is a striking object, and the court-house, jail, barrack, and union workhouse are imposing edifices. There is a free school, and three national schools. Among the not very numerous articles manufactured at Nenagh, are woolens, tobacco, soap, and candles. It is, however, a place of very considerable inland trade.

NENA SAHIB. See Nana Sahib, *ante*.

NENNIUS, a monk of Bangor, in Wales, who is believed to have lived early in the 9th century. Others, but without authority, place him in the early part of the 7th century. He calls himself, in his history, a Briton, and not a Saxon, and a pupil of bishop Elbodus, or Elvodug. He is known only from the history of Britain ascribed to him, *Historia Britonum*, or *Eulogium Britanniæ*. The work begins with a mythical genealogy of Brut, grandson of Æneas, and first king of Britain. After a description of the Pictish emigration to n. Britain, and the Scottish settlement of Ireland, and a brief account of the Roman conquest and rule in Britain, he treats of the Anglo-Saxon invasion and conquest down to 655. The author says at the beginning that the work was compiled "from the annals of the Romans. and the chronicles of the fathers, from the writings of the Scots and Angli, and the traditions of our ancestors." His book is confused and often untrustworthy. Its chief value is the collection of legends contained in it, such as those of king Arthur and Merlin. It is in dispute, indeed, if Nennius ever lived, and if the history which bears his name be not a later forgery. The name of Nennius was not connected with it till the 13th century. The manuscript contains many interpolations, the work of a copyist who admits that he omitted portions of the work of Nennius, and added passages of his own.

NEOLOGY, a term signifying new doctrine or new statement, and first used in Germany about the middle of the 18th c. to denote the new statement of Christian doctrine and new explanations of biblical facts which, in their developments, became widely known as rationalism. The Neologists at first, professing to regard Christianity as an inestimable blessing to men and the Scriptures as the rule of faith, proceeded to explain

the doctrines of the former and the facts of the latter according to what they called the increasing intelligence supplied by education and culture. Without affirming that anything in the Bible was false, they asserted that many things in it had been misunderstood. Without assailing the historical character of the miracles they attributed them entirely to natural powers and means. Beginning with explaining away the less important facts, they gradually applied the same process to the most vital doctrines. Thus, students of the Bible and of theology, as well as congregations and the people generally, were prepared for the absolute "rationalism" which denies a special divine revelation in the Bible. See RATIONALISM.

NE'OPHYTE (Gr. *neophutos*, from *neos*, new, and *phuo*, to grow), the name given in early ecclesiastical language to persons recently converted to Christianity. The word is used in this sense by St. Paul (1 Tim. iii. 6), and is explained by St. Gregory the great as an allusion to "their being newly planted in the faith" (Epp. b. v. ep. 51). It differed from catechumen (q.v.), inasmuch as it supposed the person to have not only embraced the doctrines of the church, but also to have received baptism. St. Paul, in the passage referred to, directs Timothy not to promote a neophyte to the episcopate; and this prohibition was generally maintained, although occasionally disregarded in very extraordinary circumstances, such as those of St. Ambrose (q.v.). The duration of this exclusion was left for a time to the discretion of bishops; but several of the ancient synods legislated regarding it. The third council of Arles, 524, and the third of Orange in 538, fix a year as the least limit of probation. In the modern Roman Catholic church the same discipline is observed, and extends to persons converted not alone from heathenism, but from any sect of Christians separated from the communion of Rome. The time, however, is left to be determined by circumstances. The name neophyte is also applied in Roman usage to *newly ordained priests*, and sometimes, though more rarely, to the *novices* of a religious order.

NEOPLA'TONISTS, the name given to an illustrious succession of ancient philosophers who claim to found their doctrines and speculations on those of Plato. Strictly speaking, however, the Platonic philosophy—that is, in its original and genuine form—expired with Plato's immediate disciples, Speusippus and Xenocrates. Arcesilaus (q.v.), the founder of the new academy, and at a later period Carneades (q.v.), introduced and diffused a skeptical *Probabilism*, which gradually destroyed that earnest and reverent spirit of intellectual inquiry so characteristic of the great pupil of Socrates. The course of political events in the ancient world also largely assisted in bringing about the same result. The triumphs of the Roman power had been accomplished at the expense of national liberties, and had issued in a general deterioration of moral character, both in the east and the west. Public men, especially, sought, above all things, material gratifications, and came to look upon philosophy itself as only a more exquisite kind of luxury. It was quite natural, therefore, that skepticism and eclecticism should become the prevalent forms of philosophy. Besides, the speculations of the older philosophers were felt to be unsatisfactory. When men began to review the long succession of contradictory or divergent systems that had prevailed since the time of Thales the Milesian, in the gray dawn of Greek history, a suspicion appears to have sprung up that reality, certainty, truth, was either not attainable, or could only be attained by selecting something from every system. Moreover, the immensely extended intercourse of nations, itself a result of Roman conquest, had brought into the closest proximity a crowd of conflicting opinions, beliefs, and practices, which could not help occasionally undergoing a confused amalgamation, and in this way presented to view a practical eclecticism, less refined and philosophical indeed than the speculative systems of the day, but not essentially different from them. This tendency to amalgamation showed itself most prominently in Alexandria. Placed at the junction of two continents, Asia and Africa, and close to the most cultivated and intellectual regions of Europe, that celebrated city naturally became a focus for the chief religions and philosophies of the ancient world. Here, the east and the west, Greek culture and oriental enthusiasm, met and mingled; and here, too, Christianity sought a home, and strove to quell, by the liberality of its sympathies, the myriad discords of paganism. "Greek skepticism," says Mr. Lewes, "Judaism, Platonism, Christianity—all had their interpreters within a small distance of the temple of Serapis." It is not wonderful, therefore, that a philosophy, which so distinctly combines the peculiar mental characteristics of the east and the west, as that promulgated by the Neoplatonists, should have originated in Alexandria. Yet, at the same time, it is but right to notice, as does M. Matter in his *Histoire de l'Ecole d'Alexandrie*, that it soon ceased to have any local connection with the city. Its most illustrious representatives were neither natives of Alexandria, nor members of the famous museum, and they had their schools elsewhere—in Rome, in Athens, and in Asia.

It is not easy to say with whom *Neoplatonism* commenced. Scholars differ as to how much should be included under that term. By some it is used to designate the whole new intellectual movement proceeding from Alexandria, comprising, in this broad view, the philosophy, 1st, of Philo-Judæus and of Numenius the Syrian; 2d, of the Christian fathers (Clemens Alexandrinus, Origen, etc.); 3d, of the gnostics; and 4th, of Ammonius Saccas and his successors. Others, again, would exclude the second of these (though the Alexandrian divines frequently Platonize); while a third party is disposed

to restrict the application of the term to the fourth. The last of these modes of regarding Neoplatonism is the one most current, and is perhaps the most convenient and definite; yet Bouterwek, Tennemann. Lewes, etc., agree in considering Philo-Judæus (q.v.) an Alexandrian Jew, and (in part) contemporary of Jesus Christ, as the first of the Neoplatonists—that is to say, as the first who endeavored to unite the mysteries of oriental belief with the dialectics and speculations of the Platonists. A similar course was at least partially pursued by the Christian fathers of Alexandria, partly from a predilection for the philosophy in which they had been reared, and partly from a desire to harmonize reason and faith, and to make their religion acceptable to thoughtful and educated pagans; hence, they too may, not without reason, be classed along with Philo, though their spirit and aim are distinctively and even strongly Christian. In gnosticism, on the other hand, speaking generally, the lawless mysticism of the east predominated, and we see little either of the spirit or logic of Plato. They may, therefore, be dismissed from the category of Neoplatonists. Regarding Philo-Judæus and the Alexandrian divines, it must be noticed that they wrote and taught in the interests of their own religion, and had no idea of defending or propagating a heathen philosophy. It is this which strikingly distinguishes them from the school founded by Ammonius Saccas, and also from an independent group of pagan teachers and authors who likewise flourished in the first and second centuries after Christ, and whose main object was to popularize and diffuse the ethics and religio-philosophic system of Plato, by allegorically explaining the ancient mysteries of the popular belief in harmony with the ideas of their master, but, at the same time, blending with these many Pythagorean and Aristotelian notions. The best-known names of this group are Plutarch (q.v.) and Appuleius (q.v.). These men have a better claim to the title of Neoplatonists than any of the others. They adhered far more closely to their great master, and were, in fact—to the best of their ability—simply popular expounders of his philosophy. Living at a time when paganism was in a moribund condition, they sought to revive, purify, and elevate the faith in which their fathers had lived. Christianity, a young, vigorous, and hostile system, was rooting itself in the hearts of men deeper and deeper every day, and these disciples of Plato—tenderly attached to their ancestral religion—felt that something must be done to preserve from going out the fires that were feebly burning on the altars of the ancient gods.

But these commentators and expositors of Plato were not remarkable for their philosophical power; a fresh stream of life was first poured into the old channels of Platonic speculation by Ammonius Saccas (q.v.) and Plotinus (q.v.), and it is this fact which gives the school which they established its best claim to the exclusive title of *Neoplatonist*. "In no species of grandeur was the Alexandrian school deficient," as M. Saisset justly observes: "genius, power, and duration have consecrated it. Reanimating during an epoch of decline the fecundity of an aged civilization, it created a whole family of illustrious names. Plotinus, its real founder, resuscitated Plato; Proclus gave the world another Aristotle; and in the person of Julian the apostate, it became master of the world. For three centuries it was a formidable rival to the greatest power that ever appeared on earth—the power of Christianity; and if it succumbed in the struggle, it only fell with the civilization of which it had been the last rampart" (Lewes's *Biog. Hist. Phil.* p. 259). The essence of *all* the Alexandrian speculations, we have stated, consists in the blending of Platonic ideas with oriental mysticism; the peculiarity of the *Neoplatonists*, strictly so-called, lies simply in the novelty, audacity, and ingenuity of their reasonings. They aimed at constructing a religion on a basis of dialectics. They strove to attain a knowledge of the highest, and the way in which they endeavored to accomplish this was by assuming the existence of a capacity in man for passing beyond the limits of his personality, and acquiring an intuitive knowledge of the absolute, the true—that which is beyond and above the fluctuations and dubieties of "opinion." This impersonal faculty is called *ecstasy*. By means of it, man—ceasing, however, it should be observed, to be individual man, i.e., *himself*—can identify himself with the absolute (or infinite). Plotinus, in fact, set out from the belief that "philosophy" (i.e., "absolute truth") is only possible through the identity of the thinker, or rather of the subjective thought, with the thing thought of, or the objective thought. This intuitive grasp or "vision" of the absolute is not constant; we can neither force nor retain it by an effort of will; it springs from a divine inspiration and enthusiasm, higher and purer than that of poet or prophet, and is the choicest "gift of God."

The god of Plotinus and the other Alexandrians is a mystical trinity, in the exposition of which they display a dialectical subtlety that even the most ingenious of the schoolmen never reached. The divine nature contains within it three hypostases (substances); its basis, if we may so speak, is called unity, also poetically primitive light, etc. This unity is not itself any *thing*, but the principle of all things; it is absolute good, absolute perfection; and though utterly incapable of being conceived by the understanding, there is that in man that assures him that it—the incomprehensible, the ineffable, *is*. "It has neither quantity nor quality; neither reason nor soul; it exists neither in motion nor repose; neither in space nor time; it is not a numeric unity nor a point; . . . . it is pure esse without accident; . . . . it is exempt from all want or dependency, as well as from all thought or will; it is not a thinking being, but thought itself—the principle and cause of all things." To the skeptic this "primitive light," we are afraid, will not seem very luminous. From "unity," as the primordial source of all things, emanates "pure

intelligence" (*nous*—the *vernunft* of modern German metaphysics); its reflection and image, that by which it is intuitively apprehended; from pure intelligence, in turn, emanates the "soul of the world" (*psyche tou pantos*), whose creative activity produces the souls of men and animals, and "nature;" and finally, from nature proceeds "matter," which, however, is subjected by Plotinus to such refinement of definition that it loses all its grossness. Unity, pure intelligence, and the world-soul thus constitute the Plotinian triad, with which is connected, as we have seen, the doctrine of an eternal emanation, the necessity of which he endeavors to demonstrate by the most stringent logic. Human souls, whose source is the pure intelligence, are—by some mysterious fate—imprisoned here in perishable bodies, and the higher sort are ever striving to reascend to their original home. So Plotinus, when in the agonies of death, said calmly to his friends: "I am struggling to liberate the divinity within me."

The most distinguished pupil of Plotinus was Porphyrius (q.v.), who mainly devoted himself to expounding and qualifying the philosophy of his master. In him we see, for the first time, the presence of a distinctively antichristian tendency. Neoplatonism, which can only be properly understood when we regard it as an attempt to place paganism on a philosophical basis—to make the Greek religion philosophical, and Greek philosophy religious—did not *consciously* set out as the antagonist of Christianity. Neither Ammonius Saccas nor Plotinus assailed the new faith; but as the latter continued to grow, and to attract many of the most powerful intellects of the age into its service, this latent antipathy began to show itself. Porphyry wrote against it; Iamblichus (q.v.), the most noted of his pupils, did the same. The latter also introduced a theurgic or "magical" element into Neoplatonism, teaching, among other things, that certain mysterious practices and symbols exercised a supernatural influence over the divinities, and made them grant our desires. Magic is always popular, and it is therefore not wonderful that Iamblichus should have had numerous followers. Ædesius succeeded to his master's chair, and appears to have had also a considerable number of disciples. To the school of one of them the emperor Julian belonged, whose patronage for a moment shed a gleam of splendor over Neoplatonism, and seemed to promise it a universal victory. After a succession of able but not always consistent teachers, we reach Proclus (q.v.), the last great Neoplatonist, who belongs to the 5th c., a man of prodigious learning, and of an enthusiastic temperament, in whom the pagan-religious, and consequently antichristian, tendency of the Neoplatonic philosophy culminated. His ontology was based on the Triad of Plotinus, but was considerably modified in detail; he exalted "faith" above "science" as a means of reaching the absolute unity; was a believer in Theurgy, and so naturally laid great stress upon the ancient Chaldean oracles, Orphic hymns, mysteries, etc., which he regarded as divine revelations, and of which he considered himself—as, indeed, he was—the last great "interpreter." His hostility to the Christian religion was keen; in its success he saw only the triumph of a vulgar popular superstition over the refined and beautiful theories of philosophy; it was as if he beheld a horde of barbarians defacing the statues and records of the Pantheon. The disciples of Proclus were pretty numerous, but not remarkable for high talent. Perhaps the ablest of his successors was Damascius, in whose time the emperor Justinian, by an arbitrary decree, closed the schools of the heathen philosophers. "The victims," says Cousin (*Cours d'Histoire de la Philosophie Moderne*), "of fierce retaliation, and of an obstinate persecution, these poor Alexandrians, after having sought an asylum in their dear east, at the court of Chosroes, returned to Europe (533 A.D.), were dispersed over the face of the earth, and the most part extinguished in the deserts of Egypt, which were converted for them into a philosophic Thebais." See Fichte, *De Philosophiæ Novæ Platonicæ Origine* (Berl. 1818); Bouterwek, *Philosophorum Alexandrinorum ac Neo-Platonicorum, recensio Accuratior* (Gött. 1821); Matter, *Essai Historique sur l'Ecole d'Alexandrie* (2 vols. Par. 1820); Simon, *Histoire de l'Ecole d' Alexandrie* (2 vols. Par. 1845); Barthélemy St. Hilaire, *De l'Ecole d'Alexandrie* (Par. 1845); Lewes, *Biographical History of Philosophy* (1857); and Ueberweg's *History of Philosophy* (Translation, Hodder and Stoughton: 1872).

NEO'SHO, a co. in s.e. Kansas; intersected by the Lawrence and Southwestern railroad, and by two branches of the Missouri, Kansas, and Texas; drained by the Neosho river, flowing from n.e. to s.w., dividing it into two equal parts; 576 sq.m.; pop. '80, 15,124—14,156 of American birth. By far the greater part of the surface is an undulating prairie; wheat is raised in large quantities; Indian corn, oats, and grass are also staples. Limestone and coal are found. Co. seat, Erie.

NEOSHO RIVER. rises in e. central Kansas, in Morris co., and after flowing about 450 m. in a generally s.e. direction, empties into the Arkansas near fort Gibson. It passes through Morris, Lyon, Coffey, Allen, Neosho, and Labette counties., in Kansas, and then enters the Cherokee reservation in Indian territory, changing its direction to s.w. The country through which it passes is mostly prairie and good wheat land. Coal is found near its banks.

NEOTTIEÆ. See page 888.

NEOZO'IC (Gr. new life), a term introduced by Edward Forbes to include all the strata from the trias to the most recent deposits. They are generally divided into the two great groups of secondary and tertiary rocks. This division is, however, quite arbitrary—the chief point of difference depending on the occurrence in the tertiary deposits of species supposed to be the same as some still living. There is no paleontological

nor petralogical break similar to that which exists between the permian and trias. Forbes accordingly suggested the obliteration of the division between the secondary and tertiary series, and the division of all geological time into epochs—the paleozoic and the neozoic.

NE'PA AND NEPIDÆ. See WATER-SCORPION.

NEPAUL', or NIPAL, an independent kingdom of Hindustan, lying on the southern slope of the Himalayas, is bounded on the n. by Thibet, on the s. and w. by British India, and on the e. by Sikim, a protected state. Long. 80° 15′ to 88° 15′ east. It is 500 m. in length by about 100 m. in average breadth. Area, 56,745 sq.m.; pop. estimated (1880) at 3,000,000. The kingdom is separated from the plains of India by the long narrow strip of land, resembling an English down, but unhealthy, called the Terai, which extends along the whole southern border. North of this, and running parallel with it, is the great forest of Nepaul, from 8 to 10 m. broad. North of this strip is a tract of hilly country, and above that are two tracts of greater elevation, the first of which may be called mountainous, while the second might appropriately be called alpine, if it did not comprise among its mountains peaks, which, like mount Everest and Dhawalagiri, attain almost twice the elevation of mont Blanc. The principal rivers are the Kurnalli, the Gogra, the Rapti, the Gunduk with its tributaries, and the Kosi. The climate, most unhealthy in the Terai, is healthy and pleasant in the hilly and mountainous districts, suggesting that of southern Europe. In the *Valley of Nepaul*—the district surrounding the capital—the heat of Bengal, which is felt in the hollows, may be exchanged for the cold of Russia by ascending the slopes of the hills which inclose it. The soil is extremely rich and fruitful. Barley, millet, rice, maize, wheat, cotton, tobacco, sugar-cane, pine-apple, and various tropical fruits are cultivated. Gold has not been found, but iron and copper mines are worked. The inhabitants consist mainly of two tribes—the Ghurkas, whose chief occupation is war, and the Newars, who are principally artisans. The capital of the country is Khatmandu (q.v.).

NEPENTHE, a name derived from two Greek words meaning absence of grief, and applied to a narcotic drug employed by the Egyptians. Homer relates that Helen of Troy acquired from them the art of compounding the potion. Diodorus Siculus states that the women of Thebes were acquainted with the secret method of preparing it. Poe refers to it as producing forgetfulness :

> "Wretch!" I cried, "thy God hath lent thee—by these angels he hath sent thee
> Respite—respite and nepenthe, from thy memories of Lenore!
> Quaff, O quaff this kind nepenthe, and forget this lost Lenore!"
> —THE RAVEN.

William Smith, author of *Greek and Roman Antiquities*, says of nepenthe, "Among the ancients, an Egyptian drug, which had an exhilarating effect, and which was supposed to obliterate all sorrow from the memory of those who partook of it—thought by many to have been opium."

NEPENTHÉS, the only known genus of a natural order of exogenous plants called *Nepenthaceæ*, consisting of herbaceous or half-shrubby plants with diœcious flowers, natives of swampy ground in India and China, chiefly remarkable for their leaves. Each leaf consists of a dilated foliaceous petiole, prolonged beyond its foliaceous part, as if it were the prolongation of the midrib of a leaf, and terminating in a pitcher (*ascidium*), from which the name PITCHER PLANT has been very generally given to the species of this order. The pitcher is terminated by a lid, which is regarded as the true blade of the leaf. The fluid found in these pitchers is a secretion of the plant itself. Insects often enter the pitcher, and are apparently there dissolved and absorbed; so that the nepenthes would rank amongst the plants called "insectivorous" by Mr. Darwin. Pitcher plants (*N. distillatoria*) are not uncommon in our hot-houses.

NEPHELITE, (Gr. *nephelê*), a cloud, from its appearance. A unisilicate mineral, scapolite group, occurring in six or twelve-sided columnar, schorly crystals, with or without pyramidal point; white, transparent, luster glassy and greasy; when in masses, greenish, bluish-gray, brownish, or brick red. Angles: $O \wedge 1 = 135° 55'$; $a = 0.839$. Analysis (about), aluminum one-third, rather more silicon, rather less sodium, traces of carbon and potassium, with more hydrogen; atomic combination. Nephelite occurs both in ancient and modern volcanic rocks, mostly in grains or glassy crystals, and in metamorphic rocks allied to granite and gneiss, mostly in stout crystals. The former is sommite, the latter, eleolite. Eleolite occurs at Litchfield, Me., with cancrinite; in the Ozark mountains, Ark., with brookite and schorlomite; in a boulder, with sodalite, at Salem, Mass. The earliest name for nephelite is sommite, Delametherie, 1797, from the place where found on Vesuvius, then called fettstein by Werner, 1808, and eleolite (Gr. *elaion*, oil), from its greasy look, by Klaproth. The name of Haüy, 1801, has survived, and is owing to its becoming cloudy when immersed in strong acid. It is also called nepheline, and nefelina. (Dana, sys. of mineralogy, 1880.)

NEPHE'LIUM. See LITCHI.

NE'PHRITE, a mineral which is not unfrequently called jade (q.v.), and of which axe-stone (q.v.) is very generally considered a variety. It is composed of silica, magnesia, and lime; is compact, with a coarse splintery fracture, very tenacious, sometimes trans-

lucent, greasy to the touch, and of a green or greenish color. It is found in granite, gneiss, greenstone, etc., in many parts of the world. Very fine specimens are brought from Persia, Siberia, and China, and are known as *oriental jade.* The kind called *Indian jade* is olive green, and strikes fire with steel; that from China is whitish, and does not strike fire. Nephrite is used for ornaments. The Turks make it into handles for sabers and daggers. Many imaginary virtues were once ascribed to it, such as the cure of epileptic fits and of nephritic (Gr. *nephros,* kidney) complaints; hence its name.

NEPHRI'TIS, (Gr. *nephros,* kidney), inflammation of the kidneys (q.v.).

NEPI, a t. in Italy, 40 m. from Rome; pop. 2,382. It was of Etruscan origin, but came under Roman control in 400 B.C. Many interesting archæological remains are found in the vicinity.

NEPOMUC. See JOHN OF NEPOMUK.

NE'POS, CORNELIUS, a Roman historian, born in the 1st c. B.C., but the place and precise time of his birth are unknown. He was the friend of Cicero and Catullus. The only work of Nepos's which has survived (if indeed it be his), is a series of twenty-five generally brief biographies of warriors and statesmen, mostly Greeks. These biographies are distinguished by the purity of their Latinity, the conciseness of their style, and their admirable exhibition of character, but sufficient care has not been exercised in the examination of authorities, nor is the relative importance of things duly regarded. Until the middle of the 16th c., these biographies, on the strength of the titles given in the various MSS., were generally ascribed to Æmilius Probus, a writer who lived in the latter part of the 4th c.; but in 1569, an edition was put out by the famous Dionysius Lambinus, who pronounced the so-called *Lives* of Æmilius Probus to be in reality the lost work of Cornelius Nepos, *De Viris Illustribus.* His weightiest argument is drawn from the excellence of the Latin, and the chastity of the style, so unlike the corrupt and florid language of the decline. Many critics hold that these lives ought to be regarded as an abbreviation of the work of Nepos by Probus. This hypothesis is not without its difficulties, but it is perhaps the least objectionable of any. There are many editions, among which may be mentioned those of Van Staveren (Leyd. 1773), of Tzschucke (Gott. 1804), and of Bremi (Zur. 1820); and the book is in general use as a school-book. It has been very frequently translated into English and other languages.

NEPTUNE, an ancient Italian god. It is doubtful whether he was originally a marine deity at all, for the old Italians were the very opposite of a maritime people, yet his name is commonly connected with *nato,* to swim; hence, at an earlier period he may have borne another designation, afterwards forgotten. When the Romans became a maritime power, and had grown acquainted with Grecian mythology, they, in accordance with their usual practice, identified him with the Greek god whom he most resembled. This was *Poseidōn,* also *Poteidan* (connected with *potos,* a drink, *pontos,* the sea, and *potamos,* a river). Poseidon appears in his most primitive mythological form as the god of water in general, or the fluid element. He was the son of Cronos (Saturn) and Rhea, and a brother of Jupiter. On the partition of the universe amongst the sons of Cronos, he obtained the sea as his portion, in the depths of which he had his palace near Ægæ, in Eubœa. Here also he kept his brazen-hoofed and golden-maned steeds, in a chariot drawn by which he rode over the waves, which grew calm at his approach, while the monsters of the deep, recognizing their lord, made sportive homage round his watery path. But he sometimes presented himself at the assembly of the gods on Olympus, and in conjunction with Apollo, built the walls of Troy. In the Trojan war he sided with the Greeks; nevertheless he subsequently showed himself inimical to the great sea-wanderer Ulysses, who had blinded his son Polyphemus. He was also believed to have created the horse, and taught men its use. The symbol of his power was a trident, with which he raised and stilled storms, broke rocks, etc. According to Herodotus, the name and worship of Poseidon came to the Greeks from Libya. He was worshiped in all parts of Greece and southern Italy, especially in the seaport towns. The Isthmian games were held in his honor. Black and white bulls, boars, and rams were offered in sacrifice to him. Neptune was commonly represented with a trident, and with horses or dolphins, often along with Amphitrite, in a chariot drawn by dolphins, and surrounded by tritons and other sea-monsters. As befitted the fluctuating element over which he ruled, he is sometimes figured asleep or reposing, and sometimes in a state of violent agitation.

NEPTUNE. See PLANETS, *ante.*

NEPTUNE, N. J. See page 888.

NEPTUNI'AN, a term formerly applied to the geologists who maintained the aqueous as against the igneous theory of the origin of rocks.

NÉRAC, a t. in the s.w. part of Lot-et-Garonne, a French department; situated on the river Boise, 15 m. s.w. of Agen; pop. about 7,500. It is divided into two parts; the old town on the right bank, picturesque but in decay; joined by bridges to the new town on the left bank. Ruins of a temple, aqueduct, and baths, indicate that a Roman city once occupied the site, but no information in regard to it is extant. There are also remains of a monastery of about 1250 A.D.; in later times changed into a castle. Nérac took the Calvinist side in the first part of the 17th c., but was overcome by the duke of

Mayenne in 1621. It has a large corn-market, and a good trade in flax, hemp, linen, wine and brandy.

NERAZ, JOHN CLAUDIUS, D.D. See page 888.

NERBUD'DAH, a river of Hindustan, rises in the Vindhya mountains, at a height of from 3,000 to 4,000 ft. above sea-level, in lat. 22° 40′ n., long. 81° 52′ east. It flows w., past Jabalpur (190 m. from its source), where the great depression of the Vindhya mountains on the n. and the Satpura mountains on the s., known as the valley of the Nerbuddah begins. The other principal towns on its banks are Hoshangabad, Burwani, and Barneh. At Hoshangabad it is 900 yards wide, and from five to six feet in depth. At Barneh it begins to expand into a wide estuary, and after flowing 30 m. further, it falls into the gulf of Cambay. Entire length about 800 m., of which 55 are navigable for ships of considerable size.

NERCHINSK', an important mining t. of Russia, eastern Siberia, in the trans-Baikal territory, on the Nercha, a tributary of the Shilka, in lat. 51° 58′ n., long. 116° 35′ e., 4,707 m. from St. Petersburg. It was founded in 1658, and had, in 1867, 3,988 inhabitants. The district of which Nerchinsk is the center yields a good deal of gold yearly, together with large quantities of silver, lead, and iron, and precious stones. The only tin-mines in the empire are worked here. The soil in the vicinity is fertile, and the climate mild and agreeable.

NE'REIDS, in mythology. See NEREUS; NYMPHS; *ante.*

NERIAD', a t. of British India, in the presidency of Bombay and district of Kaira, on the route from Baroda to Ahmedabad, 38 m. n.w. from Baroda, on a feeder of the Sabarmati. It is the chief town of an extensive and well-cultivated tract, which produces much tobacco, and contains many prosperous towns and villages. Pop. '71, 25,520.

NE'REIS, a genus, and NEREI'DÆ, a family of *annelida,* having a long, slender body, a distinct head, with tentacles and eyes; the whole body covered with tubercles, and the gills lobed and tufted. They are all marine, and generally hide under rocks or in the sand. They swim actively, by rapid and undulating inflections of the body, and by the aid of numerous oars arranged along the sides; each formed of a stout footstalk, numerous bristles, and a flap. The proboscis is thick, strong, and armed with two jaws.

NE'REITES, the name given to animals which have left their impress on the Silurian rocks, and which exhibit a form similar to the modern Nereis. They occur on the surface of the laminæ of fine shales, over which, when it was soft, the creature moved, leaving a long and tortuous trail, which is generally found to terminate in a more defined representation produced apparently by the body itself, although every trace of it has disappeared. See ICHNOLOGY.

NEREUS, in mythology, a sea-god, son of Pontos and Gê, and father, by Doris, of the Nereïds. He had the gift of prophecy, and forewarned Paris of the destruction which the elopement of Helen would bring to Troy. Hercules, when seeking the golden apples of the Hesperides, was directed by the nymphs to the cave of Nereus, whom he found asleep. Nereus, on waking, transformed himself into a multitude of shapes, but was held fast by Hercules, whom he was obliged to instruct as to his quest.

NERI, PHILIP DE, a saint of the Roman Catholic church, and founder of the congregation of the oratory (q.v.), was b. of a distinguished family of Florence, July 21, 1515. His character, even in boyhood, foreshadowed the career of piety and benevolence to which he was destined, and he was commonly known among his youthful companions by the name of "good Philip." On the death of his parents, he was adopted by a very wealthy uncle, with whom he lived for some time at San Germano, near Monte Cassino, and by whom he was recognized as his destined heir. But he relinquished all these prospects for a life of piety and charity, and having come to Rome in 1534, he there completed his philosophical and theological studies, and won the esteem and reverence of all by his extraordinary piety, and his benevolence and activity in every good work, whether of charity or of religion. Although he did not receive priest's orders till 1551, he had already been for years one of the most earnest and devoted in all the pious works of Rome for the instruction of the poor, the care of the sick, and the reclamation of the vicious; and in 1550, in unison with several of his friends, he established a confraternity for the care of poor pilgrims visiting Rome, and other houseless persons, as well as of the sick generally, which still subsists, and which has numbered among its associates many of the most distinguished members of the Roman Catholic church. This confraternity, however, is chiefly noteworthy as having been the germ of the far more celebrated congregation of the oratory (q.v.), which was founded by St. Philip in concert with his friends Baronius and Tarugio, both afterwards cardinals, Sabriati, and some others. Besides the general objects above indicated, and the spiritual duties designed for the personal sanctification of the members, the main object of this association was the moral instruction and religious training of the young and uneducated, who were assembled in chapels or oratorios, for prayer and for religious and moral instruction. As a further means of withdrawing youth from dangerous amusements, sacred musical entertainments (thence called by the name of *oratorio*) were held in the oratory, at first consisting solely of hymns, but afterwards partaking of the nature of sacred operas or dramas, except that they did not admit the scenic or dramatic accompaniments of these more secular compositions. Religious and literary lectures also formed part of his plan,

and it was in the lectures originally prepared for the oratory that, at the instance of Neri, the gigantic *Church History* of Baronius had its origin. The personal character of Neri, the unselfish devotedness of his life, his unaffected piety, his genuine love of the poor, his kindly and cheerful disposition, and, perhaps, as much as any of the rest, a certain quaint humor, and a tinge of what may almost be called drollery which pervaded many of his sayings and doings, contributed to popularize his institute, and to engage the public favor for himself and his fellow-laborers. He himself enjoyed the reputation of sanctity and of miracles among his fellow-religionists almost beyond any of the modern saints; and he may still be described as emphatically the popular saint of the Roman people. He lived to an extreme age in the full enjoyment of all his faculties, and in the active discharge to the last of all the charitable duties to which his life had been devoted. He died at the age of 80, May 26, 1595. He was canonized by Gregory XV. in 1622. His only literary remains are his *Letters* (8vo, Padua, 1751); the *Constitutions* of his congregation, printed in 1612; some short spiritual treatises, and a few sonnets, which are printed in the collection of *Rime Oneste.*

NE'RIUM. See OLEANDER.

NE'RO, Roman emperor from 54 A.D. to 68 A.D., was b. at Antium, on the coast of Latium, Dec. 15, 37 A.D., and was the son of Cn. Domitius Ahenobarbus and of Agrippina, the daughter of Germanicus Cæsar, and sister of Caligula. His mother, becoming the wife of the emperor Claudius, Claudius adopted him (50 A.D.), and his name, originally L. Domitius Ahenobarbus, was changed to Nero Claudius Cæsar Drusus Germanicus. After the death of Claudius (54 A.D.), the Pretorian guards, at the instigation of Afranius Burrhus, their prefect, declared him emperor, instead of Claudius's son Britannicus, and their choice was acknowledged both by the senate and the provinces. His reign began with the semblance of moderation and good promise, under the guidance of Burrhus and his tutor Seneca the philosopher; but the baleful influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged headlong into debauchery, extravagance, and tyranny. He caused Britannicus, the son of Claudius, to be treacherously poisoned at the age of 14, because he dreaded him as a rival, and afterwards (59 A.D.) caused his own mother Agrippina (with whom he was latterly on bad terms) to be assassinated, to please his mistress Poppæa Sabina (the wife of his principal boon-companion Otho, afterwards emperor), in order to marry whom he also divorced and afterwards put to death his wife Octavia (aged 20), the sister of Britannicus. The low servility into which the Roman senate had sunk at this time, may be estimated from the fact that it actually issued an address congratulating the hateful matricide on the death of Agrippina. Nero himself, on the other hand, confessed that he was ever haunted by the ghost of his murdered mother. The affairs of the empire were at this time far from tranquil. In 61 A.D. an insurrection broke out in Britain under queen Boadicea, which was, however, suppressed by Suetonius Paulinus. The following year saw an unsuccessful war against the Parthians in Armenia. At home, matters were not much better. The emperor was lampooned in verse; the senate and priesthood, alike venal, were also satirized by audacious malcontents; Burrhus, a valuable friend, died; and even Seneca, though not a great moralist, out of his books, thought it only decent to remove from court. In July, 64, occurred a great conflagration in Rome, by which two-thirds of the city were reduced to ashes. Nero himself is usually believed to have been the incendiary. It is said that he admired the spectacle from a distance, reciting verses about the burning of Troy, but many scholars are doubtful whether he really had any hand in it. At all events he laid the blame on the Christians—that mysterious sect, who, like the Jews in the middle ages, were the cause of all otherwise inexplicable calamities, and persecuted them with great fury. Moreover, he rebuilt the city with great magnificence, and reared for himself on the Palatine hill a splendid palace, called, from the immense profusion of its golden ornaments, the *Aurea Domus*, or Golden House; and in order to provide for this expenditure, and for the gratification of the Roman populace by spectacles and distributions of corn, Italy and the provinces were unsparingly plundered. A conspiracy against him failed in the year 65, and Seneca and the poet Lucan fell victims to his vengeance. In a fit of passion he murdered his wife Poppæa, by kicking her when she was pregnant. He then proposed to Antonia, the daughter of Claudius, but was refused, whereupon he caused the too fastidious lady to be put to death, and married Statilia Messallina, after killing her husband. He also executed or banished many persons highly distinguished for integrity and virtue. His vanity led him to seek distinction as a poet, a philosopher, an actor, a musician, and a charioteer, and he received sycophantic applauses, not only in Italy, but in Greece, to which, upon invitation of the Greek cities, he made a visit in 67. But in 68, the Gallic and Spanish legions, and after them the Pretorian guards, rose against him to make Galba emperor, and Nero fled from Rome to the house of a freedman, Phaon, about four miles distant. The senate, which had hitherto been most subservient, declared him an enemy of his country, and the tyrant ended his life by suicide, June 11, 68. One is sorry to learn that such a wretch had a taste for poetry, and was skilled in painting and modeling.

NERSES. See page 888.

NER'VA, M. COCCEIUS, a Roman emperor, elected by the senate after the murder of Domitian, Sept. 18, 96. He was born 32 A.D., of a family belonging to Narnia, in

Umbria, and twice held the honor of consulship, before his election to the dignity of emperor. He displayed great wisdom and moderation, rectified the administration of justice, and diminished the taxes; but finding himself, upon account of his advanced age, not vigorous enough to repress the insolence of the Pretorian guards, he adopted M. Ulpius Trajanus, then at the head of the army of Germany, who succeeded him on his death, Jan. 27, 98. After his decease, he obtained an apotheosis.

NERVE. See NERVOUS SYSTEM, *ante*.

NERVE CELL. See HISTOLOGY.

NERVII, an ancient tribe in Belgica, n. of the Ambiani. In the time of Cæsar, who first mentions them, they were a warlike people, who prohibited trade with their neighbors, forbade the introduction of luxuries, and attempted to make an alliance of the surrounding tribes against the Romans. Upon Cæsar's advance into their territory they sent their children and old men and women to a place of safety in the marshy country near the sea, and stationed themselves in ambuscade along the banks of the river Sabis, now the Sambre. When the Romans came up, and began to prepare their camp, they were suddenly attacked by a force of 60,000 men, and only the military skill of Cæsar saved them from defeat. After a desperate contest the Nervii were put to flight. In 54 B.C., however, they joined the Eburones in an assault upon the camp of Quintus Cicero. They submitted to the Romans, 53 B.C. Their chief towns were Camaracum, now Cambrai, and Bagacum, now Bavai.

NERVOUS DISEASES OF AN OBSCURE NATURE AND **NERVOUSNESS.** Although the most important affections of the nervous system, as chorea, convulsions, epilepsy, hydrophobia, hypochondriasis, hysteria, neuralgia, paralysis, spasms, and tetanus, have been considered in special articles, there is an infinite variety of (often evanescent) forms which the diseases of the nervous system assume, some of which we propose now to consider.

These nervous affections are almost solely confined to women, and most of them may be regarded as modified forms of hysteria. *Simulated pregnancy*, or, as the French physicians term it, *nervous pregnancy*, is an affection of not very rare occurrence. The abdomen gradually enlarges, the catamenia are suppressed, and sickness, enlargement of the breasts, with the other symtoms of pregnancy, supervene (as far as they can be recognized by the non-professional observer), and it is only the non-appearance of the infant at the expected period that leads to a suspicion of the true nature of the case. The diagnosis of such a case is extremely difficult, and the most celebrated accoucheurs have been deceived. We commence with this extreme instance, as being singularly illustrative of the power which a perverted action of the nervous system may impress upon certain persons. The somewhat allied cases in which patients persist in fancying themselves pregnant in opposition to the opinion of their medical adviser (as the well-known case of queen Mary, so admirably drawn by Froude), are far more numerous. The intestines are often implicated in cases of a deranged condition of the nervous system. The excretion of gas from the intestinal mucous membrane is often much increased in the class of patients commonly called nervous. The rattling sounds produced by the movement of the gas—scientifically known as *bomborygmi*—are sometimes so loud as to prevent the patient from entering into society with comfort; and sometimes the mere fear of the occurrence of these sounds is sufficient to induce them. A depraved appetite, scientifically known as *pica*, is a common symptom of deranged nervous system both in chlorotic young women, in whom the catamenial discharge is not well established, and in pregnant women. See MORBID APPETITES. The not very rare cases of fasting women and girls belong to the same category. All these cases, however, ultimately undergo detection.

Dr. Parry and other physicians have described cases of morbid sensibility of the mucous membrane of the pharynx, in which the muscles of the larynx are called into violent action if the patient takes a sip of water or other fluid. Such cases so strongly simulate hydrophobia that they are described as hysteric hydrophobia.

Passing on to the special modifications which an abnormal state of the nervous system impresses on the organs of circulation, we have nervous palpitation of the heart, which may readily be distinguished from palpitation dependent on change of structure by due attention to symptoms. There is a peculiar form of abdominal pulsation, due solely to nervous influence, which may not very unfrequently be felt on pressing the hand on the patient's abdomen. It has in many cases been mistaken for aneurism.

The nervous symptoms implicating the respiratory organs are not only the most common of any, but are alarming and urgent, and may be readily mistaken for indications of serious inflammatory or organic disease. Nervous asthma, which is supposed to depend upon a spasmodic constriction of the bronchial tubes, is too well known to require comment. Women suffering from a deranged condition of the nervous system sometimes present symptoms of what may be termed nervous catarrh—such as a copious flow of tears, free discharge from the nostrils, and constant sneezing. Such cases are often periodic. They may be treated with preparations of iron, and are sometimes at once checked by a pinch of snuff. There are various forms of cough due mainly to nervous irritation, the difference in the character of the cough probably depending on the spot which is the seat of irritation. Thus, we hear of *spasmodic* cough, which is often accompanied by much

straining and convulsive agitation, and somewhat resembles whooping-cough; *ringing* cough, accompanied by dyspnœa and hoarseness, or loss of voice; *barking* cough, often arising from irritation of the ovaries, etc. Such coughs as these are aggravated by depleting measures, ordinary cough medicines, etc., and usually disappear under the use of tonics.

The nervous affections of the motor system are conveniently grouped by Dr. Laycock under three heads—(1) the first including those cases in which there is paralysis or spasm without distortion; (2) those in which distortion follows cessation of muscular equilibrium, as in the various forms of club-foot; and (3) paroxysmal affections. The best example of the *first* class is hysterical paralysis of the lower extremities, of which sir Benjamin Brodie long ago wrote as follows: "I have known not a few, but very numerous, instances of young ladies being condemned to the horizontal posture, and even to the torture of caustic issues and setons, for several successive years, in whom air, and exercise, and cheerful occupations would probably have procured a cure in the course of a few months." A notice of such cases as these may be found in the article HYSTERIA. Paralysis of a lateral half of the body, or of one limb only, may also be merely a manifestation of hysteria. The *second* class is well illustrated by the following case, which is reported by Mr. Shaw. A young lady who had suffered from a train of symptoms indicative of a disturbed nervous system, had the ankle so turned round that she walked on one side of the foot. The knee was also bent outward, and the spine was becoming distorted. Sir Charles Bell, who saw her in consultation, regarded the case as one of willful deception, and in a year's time his diagnosis was completely established, scarcely any trace of lameness being apparent. Many of the joints—as the knee, hip, etc.—may be the seats of purely neuralgic symptoms, which so closely simulate organic disease of the cartilages, as to lead to the removal of the limb. Carmichael, Brodie, and others have recorded cases in which this terrible mistake has been made by experienced surgeons. Spinal irritation, or spinal tenderness, is a mysterious affection, whose diagnostic value is not very definite, as it may arise from a large number of distinct conditions, as, for example, disease of some part of the spinal cord, uterine disease, chronic disease of the intestinal viscera, etc.

One of the most anomalous affections of the nervous system ever recorded is described by Mr. Holden in the *St. Bartholomew's Hospital Reports*, 1867, vol. iii., pp. 299–305. The patient was a bright-looking boy about 12½, who, as he lay reading in bed, presented every appearance of perfect health: all that he complained of was what he called his "bump," which was about the size of a hen's egg, and lay on the right side of the neck, just above the shoulder. If the "bump" were touched, even most gently, the boy instantly lost all consciousness, and became deaf, dumb, and blind, while his body became arched like a bow, and was supported only by the back of the head and the heels, while his arms were rigidly extended. He might be pinched or pricked, but showed no sign of sensation. After remaining in this state for somewhat less than a minute, he drew a deep long breath, which was followed by a deep sigh. Instantly the spasm ceased, and the body fell, seemingly lifeless, on the bed. After two other similar sighs, which occurred in a few seconds, the boy awoke as if from profound sleep, and in a few minutes was none the worse for what he had gone through. Whenever the bump was touched—even when the boy was fast asleep—the same phenomena occurred. (It was found that, on touching the backbone in the dorsal region, the same series of events happened.) By continuous gentle manipulation of the bump, the boy was kept unconscious for twenty minutes. Another and even more remarkable phase of the boy's affection was his crowing and barking fit, which took place every day at the same time, almost to a minute. See the reports above cited.

With this illustration, we close our remarks on what may be termed *anomalous nervous affections*. With regard to *nervousness*, which also stands at the head of this article, we may observe, that it is a word pertaining rather to the vocabulary of the patient (and pre-eminently of the female patient) than of the physician. It is usually understood to indicate a condition of which a restless mobility, with or without an undue excitability of the nerves of sensation, is the chief characteristic. For further information on this subject, the reader is referred to Dr. Laycock's various works, and to Romberg *On Diseases of the Nervous System*, 2 vols., translated by Dr. Sieveking.

NERVOUS SYSTEM, THE, is composed in all vertebrated animals of two distinct portions or systems—viz., the *cerebro-spinal* and *sympathetic* or *ganglionic*.

The *cerebro-spinal system* includes the brain and spinal cord (which form the *cerebro-spinal axis*), and the cranial and spinal nerves. It was termed by Bichat the nervous system of animal life, and comprises all the nervous organs concerned in sensation, volition, and mental action.

The *sympathetic system* consists essentially of a chain of ganglia connected by nervous cords, extending from the cranium to the pelvis, along each side of the vertebral column, and from which nerves with large ganglionic masses proceed to the viscera and blood-vessels in the cavities of the chest, abdomen, and pelvis. It was termed by Bichat the nervous system of organic life, since it seems to regulate—almost or quite independently of the will—the due performance of the functions of the organs of respiration, circulation, and digestion.

The essential parts of the *cerebro-spinal axis* are described in the articles BRAIN, CEREBRUM and CEREBELLUM, and SPINAL CORD. The brain and spinal cord are covered and protected by three membranes or *meninges*, as they are frequently termed—viz., the *dura mater*, the *arachnoid*, and the *pia mater*. The *dura mater* is a strong fibrous membrane, which supplies the cranial bones with blood in early life, and adheres firmly to their inner surface. It is less closely attached to the bony walls of the spinal canal. Inside the cranium it gives off processes (such as the *falx cerebri*, *tentorium cerebelli*, and *falx cerebelli*) which divide and support different parts of the brain; it gives a strong fibrous sheath to every nerve; and by splitting into two layers at certain points, it forms receptacles for venous blood, which are termed SINUSES (q.v.). The *arachnoid* (so called from its being supposed to be as thin as a spider's web) is a serous membrane, and, like all serous membranes, is a closed sac, consisting of a parietal and visceral layer. The parietal layer adheres to the inner surface of the *dura mater*, to which it gives a smooth, polished appearance; while the visceral layer somewhat loosely invests the brain and spinal cord, from direct contact with which, however, it is separated by the intervention of the *pia mater* and some loose areolar tissue. In most regions there is an interval between the visceral layer of the *arachnoid* and the *pia mater*, which is called the *sub-arachnoid cavity*, and is filled during life by the *cerebro-spinal fluid*. This fluid, which varies in quantity from two to ten ounces, keeps the opposed surfaces of the arachnoid in close contact, and affords mechanical protection to the nervous centers which it surrounds, and guards them against external shocks. It is accumulated in considerable quantity at the base of the brain, where it serves for the protection of the large vessels and nerves situated there. In fracture of the base of the skull, the draining away of this fluid, often in very large quantity, through the external auditory meatus, is often one of the most significant symptoms. It is doubtless secreted by the *pia mater*, which is the immediate investing membrane of the brain and spinal cord. This membrane consists of minute blood-vessels, held together by an extremely fine areolar tissue. It dips down between the convolutions and fissures of the brain, and is prolonged into the interior, forming the *velum interpositum* and the choroid plexuses of the fourth ventricle. It is by means of this membrane that the blood-vessels are conveyed into the the nervous substance.

We now proceed to notice the nerves connected with the cerebro-spinal center or axis. These are usually described in two classes—the *spinal* and the *cranial* or *encephalic*. The former class consists of all those which arise from the spinal cord, and emerge from the spinal canal through the inter-vertebral foramina; while the latter includes those which arise from some part of the cerebro-spinal center, and emerge through foramina in the cranium or skull.

The *spinal nerves* (exclusive of the spinal accessory nerve, which, from the fact that it emerges from the skull, is usually ranked among the cranial nerves) are thirty-one on either side, there being a pair for each pair of intervertebral foramina (whose formation is described in the article VERTEBRA AND VERTEBRAL COLUMN),, and for the foramina between the atlas (the first or highest vertebra) and the occipital bone at the base of the skull. Every spinal nerve arises from the cord by two roots, an anterior and a posterior, of which the latter is distinctly the larger. Each root passes out of the spinal canal by a distinct opening in the *dura mater*. Immediately after its emergence, a ganglion is seen on the posterior root, and in the anterior surface of this ganglion the anterior root lies imbedded. Just beyond the ganglion, but not at all previously, the nervous fibers of both roots intermingle, and a compound nerve results. The trunk thus formed separates immediately after it has passed through the intervertebral canal into two divisions—the anterior and posterior—each of which contains filaments from both roots, and possessing, as will be immediately shown, perfectly different functions. These divisions, of which the anterior is considerably the larger, proceed to the anterior and posterior parts of the body respectively, and are distributed to the skin and the muscles. The anterior branch communicates with the sympathetic nerve, as is shown in the figure. The mode of connection of the roots of the nerves with the cord is noticed in the article SPINAL CORD. These nerves are arranged in classes, according to the regions of the spine in which they originate, and we thus speak of eight cervical, twelve dorsal, five lumbar, and six sacral nerves on either side.

The discovery of the separate functions of the anterior and posterior roots of the spinal nerves, which has been characterized as the first important step towards a right understanding of the physiology of the nervous system, was made by our distinguished countryman sir Charles Bell, although there is reason to believe that Magendie, without any knowledge of Bell's experiments, arrived at similar conclusions at nearly the same time. The original experiments consisted in laying open the spinal canal in rabbits, and irritating or dividing the roots of the spinal nerves. It was observed that irritation of the anterior roots caused muscular movement, and that the posterior roots might be irritated without giving rise to any muscular action; while division of the posterior roots did not impair the voluntary power over the muscles. Hence it was inferred that the anterior roots were motor (or conveyed motive power to muscles), and the posterior roots not motor; but it was not fully determined what degree of sensibility remained in parts supplied from the divided roots. Numerous physiologists arrived at similar results to those of Bell; but the most conclusive experiments are those of Müller, who operated on

frogs, in which, from the great width of the lower part of the spinal canal, the roots of the nerves can be exposed with great facility. In these experiments, it was found that irritation of the anterior root always excited muscular contraction, while no such effect followed irritation of the posterior root; that section of the anterior root caused paralysis (or loss of power) of motion, while section of the posterior root caused paralysis of sensation; and that when the anterior roots of the nerves going to the lower extremity were cut on one side, and the posterior roots on the other, voluntary power without sensation remained in the latter, and sensation without voluntary motion in the former. The obvious conclusion to be derived from these experiments is, that the anterior root of each spinal nerve is *motor*, and the posterior *sensitive*. (In place of the terms *sensitive* and *motor*, the terms *afferent* and *efferent* are now frequently used. The functions of the nerves being to establish a communication between the nervous centers and the various parts of the body, and *vice versâ;* an *afferent* nerve communicates the impressions made upon the peripheral nervous ramifications to the centers, while an *efferent* nerve conducts the impulses of the nervous centers to the periphery.)

The *cranial nerves*, although twelve in number on either side, were arranged by Willis (*Cerebri Anatome; cui accessit Nervorum Descriptio et Usus*, 1664), whose system is still generally adopted, in nine pairs, which, taken from before backwards in the order in which they are transmitted through the foramina at the base of the skull, stand as follows: 1st, olfactory; 2d, optic; 3d, motores oculorum; 4th, pathetic; 5th, trifacial; 6th, abducentes; 7th, portio dura or facial, portio mollis or auditory; 8th, glossopharyngeal, par vagum or pneumogastric, spinal accessory; 9th, hypoglossal.

They may be subdivided into three groups, according to their functions—viz. *nerves of special sense*—the olfactory (see Nose), optic (see Eye), and auditory (q.v.); *nerves of motion, or efferent nerves*—the motores oculorum, pathetic, abducentes, facial, and hypoglossal; and *compound nerves*—the trifacial, glossopharyngeal, pneumogastric, and spinal accessory.

The reason why no nerve of taste is included in the above arrangement amongst the nerves of special sense will be subsequently seen; and we proceed briefly to notice the functions of the motor cranial nerves.

The 3d, 4th, and 6th pairs—the *motores oculorum*, *pathetic*, and *abducentes*—together make up the apparatus by which the muscles of the orbit (the four recti, the superior and inferior oblique, and the levator palpebræ) are called into motion, and are sufficiently noticed in the article Eye.

The *facial nerve*, or the *portio dura* of the 7th pair, is divisible into three stages. The first stage is the intercranial, from its origin to its exit from the cranial cavity, in association with the *portio mollis* or *auditory nerve* (q.v.), at the internal auditory meatus. The second stage is contained in the *aqueduct of Fallopius*, a bony canal lying in the petrous portion of the temporal bone. In this stage it anastomizes with other nerves, and thus *sensory* fibers are introduced into it from the 5th pair and other sources, which make irritation or some of its branches to cause pain. The third stage commences with the emergence of the nerve through the stylo-mastoid foramen. The nerve now lies in the parotid gland, and after giving off the *posterior auricular*, and a few smaller branches, finally divides into the *temporal*, *facial*, and *cervical* branches. This diverging distribution of the nervous branches over the face forms the *pes anserinus* of the older anatomists, from the supposed resemblance to the expanded foot of a goose. Careful dissection of this nerve shows that the great majority of its fibers are distributed to muscles; and indeed, if we except the muscles of mastication, which receive their motor power from the 3d division of the 5th pair, this may be regarded as the general motor nerve of the face. "The muscles which are supplied by the facial nerve are chiefly those upon which the aspect of the countenance and the balance of the features depend. The power of closing the eyelids depends upon this nerve, as it alone supplies the orbicularis palpebrarum; and likewise that of frowning, from its influence upon the corrugator supercilii. Anatomy indicates that this nerve is the motor nerve of the superficial muscles of the face and ear, and of the deep-seated muscles within the ear. This conclusion is abundantly confirmed by comparative anatomy. For wherever the superficial muscles of the face are well developed, and the play of the features is active, this nerve is large. In monkeys it is especially so. That extremely mobile instrument, the elephant's trunk, is provided with a large branch of the facial as its motor nerve. In birds, on the other hand, it is very small."—Todd and Bowman, *Physiological Anatomy and Physiology of Man*, vol. ii. p. 107.

Before sir Charles Bell commenced his experiments on the functions of the nerves, it was believed that the facial was the nerve of sensibility of the face, and it was on several occasions divided with the view of relieving tic douloureux, of which it was supposed to be the seat. But the operation, of course, yielded no relief, and always inflicted a permanent injury, since it was succeeded by paralysis of the facial muscles, with total loss of control over the features and over the closing of the eye, on the side on which the operation was performed.

The treatment of facial palsy, which is often, especially if it arises from cold, a very temporary affection, although usually a very alarming one to the patient and his friends, is described in the article Paralysis.

The *hypoglossal nerve* (derived from the Greek words *hypo*, under, and *glotta*, the

tongue) escapes from the cavity of the skull by the anterior condyloid foramen, and passes outward and forward around the pharynx to the interior surface of the tongue, where it breaks up into its terminal branches, which supply the muscular structure of that organ with motor power. This nerve communicates with the pneumogastric nerve, with the sympathetic (by branches derived from the superior cervical ganglion), and with the cervical plexus, soon after its emergence from the cranium; and subsequently, as it curves round the occipital artery, it gives off the long anastomosing branch known as the *descendens noni.*

Experiments on living animals, comparative anatomy, and pathological investigations alike indicate that this is the motor nerve of the tongue. In cases of paralysis of this nerve the power of articulation is much injured or totally destroyed; and this is often one of the first symptoms which lead the physician to apprehend serious cerebral lesion.

We now proceed to the consideration of the *compound nerves*, beginning with the *trifacial* or *fifth nerve.* This nerve, as was first pointed out by sir Charles Bell, presents a remarkable resemblance to the spinal nerves in its mode of origin; for it arises by two roots, one large and the other small, and on its larger root, as on the posterior and larger root of the spinal nerves, is a distinct ganglion; the two roots being quite distinct until after the formation of the ganglion, when the lesser one coalesces with the lowest branch, which emerges from the ganglion to form the inferior maxillary nerve. This ganglion, which is known as the gasserian ganglion, and which is formed upon the larger root of the nerve, lies upon the upper surface of the petrous portion of the temporal bone, and is of a somewhat triangular form, with its base directed forward and outward. From this base there proceed three nerves—viz., the ophthalmic, on the inside; the superior maxillary, in the middle; and the inferior maxillary, externally. The first two of these nerves consist exclusively of fibers from the ganglionic root, while the third—the inferior maxillary—is composed of fibers from both roots, and is, therefore, a compound nerve. From the mode of distribution, as well as from that of origin, it is inferred that the ophthalmic and superior maxillary are purely sensory, while the inferior maxillary is a motor and sensory nerve. Experiments on living animals confirm the inference, that have been drawn on anatomical grounds. Division of the ophthalmic or of the superior maxillary nerve induces loss of sensibility, without any serious impairment of muscular power; but when the inferior maxillary nerve, on either side, is divided, the power of mastication is destroyed on that side, and the sensibility of the tongue and of the lower part of the face on that side is lost.

The lingual or gustatory branch of the inferior maxillary is distributed to the mucous membrane and papillæ at the fore part and sides of the tongue, where it acts both as a nerve of common sensibility and of taste. (The consideration of the respective parts which this nerve and the glossopharyngeal play in the sense of taste, is considered in the articles Tongue and Sense of Taste.)

The trifacial nerve is the seat of the affection known as tic-douloureux, and described in the article Neuralgia. It is in the dental branches of this nerve that toothache is situated; and in the process of teething in young children, the irritation of these branches, consequent upon the pressure of the teeth, often gives rise to convulsions, by being conveyed to the medulla oblongata, and exciting motor nerves by reflex action.

The *glossopharyngeal nerve* is principally an afferent or sensory nerve, but has a small motor root. It escapes from the cranium in association with the pneumogastric and spinal accessory nerves, through the same foramen as that through which the jugular vein emerges. It then descends by the side of the pharynx, and after anastomising with the facial and pneumogastric nerves, and giving off a branch to the tympanum of the ear, terminates in branches to the mucous membrane of the base of the tongue, of the palate, tonsils, and pharynx, and in twigs to the digastric and stylopharyngeal muscles; so that its distribution is almost entirely to sentient surfaces. From a careful examination of the investigations of Dr. John Reid and others regarding the functions of this nerve, Todd and Bowman arrive at the following conclusions: 1. "It is the sensitive nerve of the mucous membrane of the fauces and of the root of the tongue, and in the latter situation it ministers to taste and touch, as well to common sensibility; and being the sensitive nerve of the fauces, it is probably concerned in the feeling of nausea, which may be so readily excited by stimulating the mucous membrane of this region." 2. "Such are its peripheral organization and central connections, that stimulation of any part of the mucous membrane in which it ramifies, excites instantly to contraction all the facial muscles supplied by the pneumogastric and the facial nerves; and the permanent irritation of its peripheral ramifications, as in the case of sore throat, will affect other muscles supplied by the facial nerve likewise. It is, therefore, an excitor of the movements necessary to pharyngeal deglutition."—*Op. cit.* vol. ii., p. 119.

The *pneumogastric nerve*, or *par vagum*, is distributed to so many important organs (the larynx, heart, lungs, stomach, etc.), and is of such great physiological importance, that a special article is devoted to its consideration.

The *spinal accessory nerve* is more remarkable for its peculiar course than in any other respect. It rises from the spinal cord at the level of the fifth or sixth cervical nerve, passes upwards between the anterior and posterior roots of the cervical nerves into the skull, and emerges from the cranial cavity with the two preceding nerves. It is chiefly distributed to the trapezius muscle.

In the above remarks on the cranial nerves, we have omitted all notice of their points of origin, as that subject is sufficiently noticed in the article BRAIN.

We shall now briefly notice the mode in which the extremities receive their nerves. These nerves are derived from the spinal nerves, through the intervention of what is termed in anatomy a *plexus*. Four or five nerves proceed from the spinal cord for a certain distance, without any communication with each other. They then divide, and from the conjunction of the adjacent branches new nerves result, which again subdivide and interchange fibers. From the net-work or plexus thus formed nerves emerge, each of which is composed of fibers derived from several of the original branches. The most important of these plexuses are found in the regions of the neck, the axilla, the loins, and the sacrum, and are known as the cervical, brachial, lumbar, and sacral plexuses.

The *brachial plexus* is formed by communication between the anterior roots of the

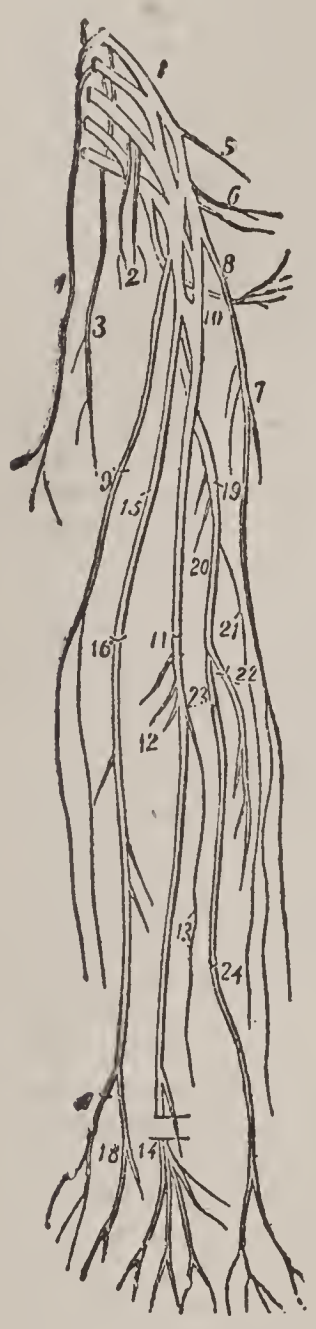

FIG. 1.—A diagram showing the brachial plexus of nerves of the left side, with its branches. Front view.

1, the brachial plexus; 2 and 3, the anterior and posterior thoracic nerves; 4, the phrenic nerves going to the diaphragm; 7 and 9, the external and internal cutaneous nerves; 10, the origin of the median nerve (which receives its name from taking a course along the middle of the forearm to the palm of the hand); 12 and 13, branches of this nerve; 14, the point at which it passes under the annular ligament, and divides into its terminal branches, which are distributed to the thumb and to all the fingers except the little finger and the outside of the ring finger, which are supplied by (15) the ulnar nerve, whose terminal branches are shown at 18; 19, the musculo-spiral nerve (the largest of the plexus); 23, 24, the radial nerve, one of the branches of the musculo-spiral.

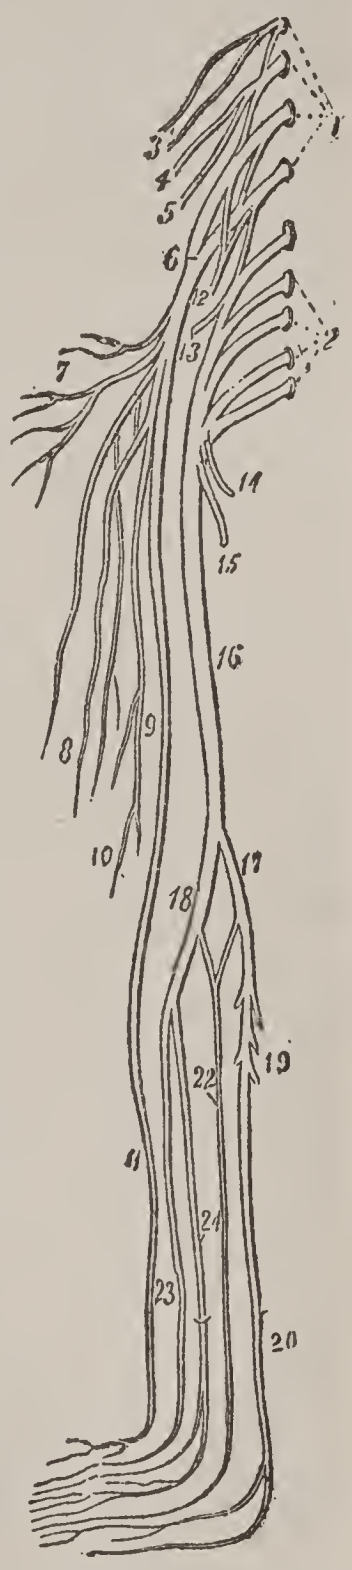

FIG. 2.—A diagram showing the lumbar and sacral plexuses, with the nerves of the lower extremity.

1, the first four lumbar nerves which, with the branch from the last dorsal, form the lumbar plexus; 2, the four upper sacral nerves, which, with the last lumbar, form the sacral plexus; 6, the anterior crural or femoral nerve; 7, 8, 9 10, its branches; 11, its terminal branch, the long or internal saphenous; 13, the gluteal nerve; 15, the lesser ischiatic nerve; 16, the greater ischiatic or sciatic nerve (the largest nerve in the body), dividing at about the lower third of the thigh, into 17, the popliteal nerve, and 18, the peroneal nerve; 19, muscular branches of the popliteal, given off in the posterior region of the knee; 20, the posterior tibial nerve, dividing, at 21, into the internal and external plantar nerves, which are distributed to the sides of the toes in precisely the same manner as the median and ulnar nerves are distributed to the fingers; 22, the external saphenous nerve; 23 and 24, the two terminal branches of the peroneal nerve—viz., the anterior tibial and the musculo-cutaneous nerves.

last four cervical nerves and the first dorsal nerve. These nerves are nearly equal in size, and their mode of distribution is sufficiently explained by the diagram. The branches emerging from this plexus supply the shoulder and the arm; and the names of the most imporant of these branches are given in the description attached to the figure.

The *lumbar* and *sacral plexuses*, with the nerves of the lower extremity, are shown in Fig. 2. The description attached to the diagram sufficiently explains the mode of formation and the distribution of the branches of these plexuses.

The general arrangement of the *sympathetic system*, or, as it is sometimes termed, the *sympathetic nerve*, has been already noticed at the beginning of this article. Its cephalic portion consists of four ganglia on either side—viz., (1) the ophthalmic, or lenticular ganglion; (2) the spheno-palatine, or Meckel's ganglion; (3) the otic, or Arnold's ganglion; and (4) the submaxillary ganglion. They are all closely connected with the branches of the trifacial nerve. The cervical portion contains 3 ganglia, the dorsal 12, the lumbar 4, the sacral 5, and the cocygeal 1, which, instead of lying on the side of the vertebral column, is placed in front of the coccyx, and forms a point of convergence for the two ganglionated cords which run from the cervical to the sacral region parallel to one another. Each ganglion may be regarded as a distinct nervous center, from which branches pass off in various directions. In addition to the cords of communication

between the ganglia, certain sets of nerves may be usually traced—viz., (1) *visceral* nerves, which generally accompany branches of arteries to the viscera (the lungs, heart, kidneys, liver, spleen, and intestines, etc.); (2) *arterial* branches, distributed to arteries in the vicinity of the ganglia; and (3) branches of *communication* with the cerebral and spinal nerves.

The only sympathetic nerve that our limited space will permit us to notice is the *great splanchnic*. This nerve arises by separate roots from the 5th, 6th, 7th, 8th, and 9th thoracic ganglia. These roots unite to form a large round cord, which passes obliquely downwards and forwards, and after entering the abdomen by piercing the diaphragm, ends in a large and complex ganglion, the *semilunar ganglion*, which lies upon the side and front of the aorta, at the origin of the cœliac axis. The semilunar ganglia, with the nerves entering and emerging from them, combine to form the *solar plexus*, which, from the mass of nervous matter which it contains, has been termed the *abdominal brain*. It is in consequence of the existence of this great nervous center, that a blow in the region in which it lies always inflicts a severe nervous shock, and not unfrequently causes death.

Experiments and clinical observations lead to the conclusion that the sympathetic system supplies motor power to many of the internal viscera, especially the heart and the intestinal canal; that it also contains sensitive fibers, as is shown by the sufferings of patients during the passage of a gall-stone or a renal calculus through a duct, whose sole nervous energy is derived from this system; that it presides over the process of secretion in the most important glands; and that it operates on the blood-vessels in causing them to contract, while the cerebro-spinal nerves produce the opposite effect.

On examining different parts of the nervous system under the microscope, we find that the nervous matter is distributed in two forms, the *vesicular* and the *fibrous*. The vesicular matter is gray in color, and granular in texture, contains nucleated nerve cells, and is largely supplied with blood; it is immediately associated with mental actions, and is the seat in which the force manifested in nervous action originates. The fibrous matter is, in most parts, white and composed of tubular fibers, though in some parts it is gray and consists of solid fibers; it is less vascular than the former, and is simply the conductor of impressions made upon it. When these two kinds of matter are united together into a mass they form a *nervous center*, such as the brain or spinal cord, while the *nerves* passing to and from them are composed of threads of fibrous matter. The nervous matter of both kinds is a soft, unctuous substance, with very slight tenacity; the softness being in a great measure due to the large quantity of water which it contains.

The *fibrous* form is the most extensively diffused throughout the body. It forms a large portion of the nervous centers, and is the main constituent of all the nerves. It occurs in two varieties, viz., as the *tubular fiber*, or the *nerve tube*, and the *gelatinous fiber*, the latter being of comparatively rare occurrence, and being found chiefly in the sympathetic system.

When a *tubular fiber* is viewed by reflected light, it presents a beautiful pearly luster, and appears to be homogeneous. But if viewed by transmitted light, with a sufficient magnifying power, indications of structure become visible. Externally, there is the *tubular membrane*, a homogeneous and probably very delicate elastic tissue, according to Todd. Within the edge of the tubular membrane, on either side are seen two thicker and darker lines, which appear to mark the outer and inner limits of the structure known as the *white substance of Schwann*, which forms a tube within the tubular membrane; and within the white substance of Schwann is a transparent material occupying the axis of the nerve tube, and commonly known as the *axis cylinder*. By the application of reagents, it is seen that the chemical composition of the white substance is different from that of the axis cylinder, and hence the functions of these two parts are doubtless different; the latter is in general soft and pulpy. The nerve-tubes are cylindrical in form, and lie parallel to one another, without any inosculation, if we except their frequent terminations in loops. Their average diameter is about $\frac{1}{3000}$th of an inch.

The *gelatinous fibers* are flattened, soft, and homogeneous in appearance, and contain numerous round or oval nuclei. Their diameter is about $\frac{1}{5000}$th of an inch. In appearance they much resemble the fibers of unstriped muscle.

The *vesicular* form of nervous matter is of a dark reddish-gray color, is found only in the nervous centers, is always well supplied with capillaries, and consists essentially of nucleated cells or vesicles, which are most commonly globular or ovoidal, but often present one or more tail-like processes, when they are termed *caudate*. These caudate vesicles present great difference in shape and size. The processes are very delicate, and readily break off close to the vesicle. They probably either serve to connect distant vesicles or else become continuous with the axis cylinders of the tubular fibers.

We may now consider the way in which the nerves and nervous centers are made up of these anatomical elements.

A *nerve* is composed of a bundle of tubular fibers surrounded and connected by areolar tissue, which forms a sheath known as the *neurolemma*, whose office is to protect the delicate tubes, and to support the capillaries from which they derive their nourishment.

The *nervous centers* exhibit a union of the vesicular and fibrous textures, which may be variously arranged. In the Brain (q.v.) the vesicular matter lies externally, forming the gray or cineritious substance; in the spinal cord, on the other hand, the vesicular or

gray matter lies in the central portion, and the fibrous or white matter is external to it; while in the ganglia the two structures are more or less uniformly associated.

From the observations which have been made in an earlier part of this article on the functions of individual nerves, it is sufficiently obvious that it is through the instrumentality of the nervous system that the mind influences the bodily organs, as when volition or emotion excites them to action; and that, conversely, impressions made on the organs of the body affect the mind, and excite mental perceptions through the same channel. "In this way," to quote the words of Dr. Todd, "the nervous system becomes the main agent of what has been called the life of relation; for without some channel for the transmission of the mandates of the will to the organs of motion, or some provision for the reception of those impressions which external objects are capable of exciting, the mind, thus completely isolated, could hold no communion with the external world." The nature of the connection between the mind and nervous matter is, and must ever be, the deepest mystery in physiology, and one into which the human intellect can never hope to penetrate. There are, however, many actions of the body in the production of which the mind has no share. Of this kind are the nervous actions, which are associated with the functions of organic life, such as digestion, respiration, and circulation. Again, there is another class of actions for which two nerves (an afferent or excitor, and a motor) and a nervous center are necessary. These are the actions known as *reflex* or *excito-motory*, for the full investigation of which physiology is especially indebted to the labors of the late Dr. Marshall Hall. For example, the movement of the œsophagus in propelling the food onwards to the stomach, is caused by the stimulus of the food acting on the excitor or afferent nerves, which, through the spinal cord, excites the motor or afferent nerves, and thus give rise to the necessary muscular action. When the edge of the eyelid is touched, the excitor nerve (a branch of the ophthalmic division of the fifth or trifacial nerve) conveys the impression of the stimulus to the nervous center, and the eye is at once closed by the motor influence, which is transmitted by a branch of the facial nerve to the orbicular muscle. In such cases as these—and they form a very numerous class—the mind takes no part. In some of them it is conscious of the application of the stimulus, as well as of the muscular act which follows; but even in these cases no effort of the will could modify or interrupt the sequence of the phenomena.

It has been already shown that the stimuli, by which the action of nerves is commonly excited, are of two kinds, mental and physical, and the change which these stimuli produce in a nerve develops the power known to physiologists as the *vis nervosa*, or nervous force. "The nervous force," says Dr. Sharpey, in his *Address on Physiology* in 1862, "has long been likened to electricity, but rather through a vague perception of analogy than from any rigorous comparison. It is true that electric force is developed in the nerves, and even exhibits modifications connected with different conditions of nervous action. Still, it must be borne in mind that the evolution of electricity is a common accompaniment of various processes involving chemical change, whether within the living body or in external nature; and the tendency of recent speculation is not towards the identification of the nerve force with electricity, but rather to suggest that the two stand related in the same way as electricity and other physical forces are related to each other—that is, as manifestations of a common force or energy, of which they, severally, are the special modifications." The velocity with which impressions are transmitted by the nerves has been recently made the subject of investigation, but it is doubtful how far the observations are to be depended on, in consequence of the various sources of fallacy by which such experiments are beset. According to Hirsch, the velocity is 34 meters, or about 112 ft. per second in man; while Helmholtz fixes it at 190 ft. per second in the frog.

The description of the nervous system given in the foregoing pages is applicable, with slight modifications, to all the vertebrates; the main differences being in the degree of the development of the brain—a point which has been already noticed at the commencement of the article BRAIN. For a sufficient notice of the plan of the nervous system in the invertebrate animals, the reader is referred to the articles ARTICULATED ANIMALS, MOLLUSCA, and RADIATA. It is only in the lowest subdivision of the animal kingdom, the PROTOZOA, that no traces of a nervous system can be detected.

For further information on the subject of this article, the reader is referred to Dr. Carpenter's works on *Human* and *Comparative Physiology*, to Dr. Todd's article on "The Nervous System" in *The Cyclopedia of Anatomy and Physiology*, to Todd and Bowman's *Physiological Anatomy and Physiology of Man*, and to Funke's *Lehrbuch der Physiologie*.

NERVOUS SYSTEM (*ante*). The nerve fibers have a great diversity of size; some of them found between the muscles are as much as $\frac{1}{1250}$ of an inch in diameter, having a tubular membrane, medullary contents, and an axial band. Other nerve fibers having the same structure are not more than $\frac{1}{25000}$ of an inch in diameter. Other fibers again are composed of an axial band and a medullary covering only; and still others have no other element than the axial band. The important element, and the one necessary to the conducting function, is the axis cylinder. In regard to the gelatinous nerve fibers, or the fibers of Remak, which are found, as stated in the preceding article, chiefly in the sympathetic system, there is a difference of opinion. By some physiologists they are believed

to be connective tissue elements, not possessing the peculiar properties of nerves; but the predominant view is that they have peculiar nerve properties. These gelatinous fibers are particularly found in that portion of the sympathetic system connected with involuntary contraction of non-striated muscles, viz., in the gray filaments sent to these muscles, and not in the white filaments of the sympathetic, which are regarded as incapable of exciting motion. Microscopic investigation has shown that, in the development of the embryo, the first formed nerve fibers are identical with the fibers of Remak, and that the new nerve elements which are formed in the reparation of injuries are also of this character. The gelatinous nerve fibers of the sympathetic system are of a flattened form, with smooth, sharp borders, having a grayish pale color, and containing, within a sheath, numerous fine granulations, and, at intervals, oval cells or nuclei of the same diameter as the caliber of the fibers, and composed of fine granular matter, without nucleoli. The dimensions of these "nuclei" or cells are about $\frac{1}{7500}$ of an inch in their short, and $\frac{1}{1200}$ of an inch in their long diameter. The medullated nerve fibers, in passing into certain organs, such as the pacinian corpuscles (q.v.), the tactile corpuscles (see TOUCH), and some glandular structures, lose the tubular sheath and medullary investment of the axis cylinder, while nothing but the latter element composes the termination. It was formerly thought that the tubular elements also entered the pacinian corpuscle, but recent observations have led to other conclusions.

Nerve cells and their relations.—The cellular elements of the nervous system, which are regarded as the "generating elements" of nervous force, are composed of four kinds of cells—apolar, unipolar, bipolar, and multipolar; and these are of various sizes and diverse appearances. The apolar cells are rounded bodies composed principally of granular matter, and having nuclei and nucleoli. They are always present in the ganglia of the sympathetic nerve, and have been found in the cerebro-spinal centers. It is not certain that unipolar cells exist in man, but they are not uncommon in the lower animals. Bipolar cells are found in the ganglia of the posterior roots of the spinal nerves, and also in ganglia of the sympathetic. Small cells, with three and sometimes four poles or connections, are found in the posterior horn of the gray matter of the spinal cord (q.v.), while large, irregularly shaped multipolar cells with numerous prolongations are found in the anterior horns of gray matter. Some of the cells have ten or twelve poles, and have received the name of motor cells. The general anatomical elements are, however, in all these forms of cells essentially alike. Except the apolar and unipolar cells, they are of irregular shape, and have highly refracting granular contents. In adult animals there is usually but one nucleus, but the nerve cells of young animals often have multiple nuclei. The nucleoli are generally single, but sometimes they are also multiple. The size of nerve cells varies, ranging from less than $\frac{1}{1200}$ to more than $\frac{1}{500}$ of an inch in diameter. The nuclei are not so variable in size, ranging from $\frac{1}{2000}$ to $\frac{1}{1200}$ of an inch. In examining these delicate organisms with the microscope it is usual to harden the tissues with chemical substances, such as chromic acid, and make very thin sections with a sharp knife; but, notwithstanding all the care that may be taken, the precise relations between the nerve cells and nerve fibers have not been satisfactorily determined. Some of the German physiologists, among them Max Schultze, have become satisfied that multipolar cells have one prolongation unlike the rest, which is continuous with the axis cylinder of the nerve fiber, the other prolongations being of a different character, and, although branching out to a considerable extent, not connected with the nerve fibers. In tracing a nerve fiber towards its origin in the white portion of a nerve center, it is observed to lose its sheath, and consist only of an axis cylinder and investing medullary substance; the white portion of the center being composed of these simply medullated, non-sheathed fibers. When a fiber passes from these white portions into the gray substance it loses its medullary investment, and passes among the cells simply in the form of an axis cylinder; and although it is certain that many fibers are prolongations of the poles of the cells, it is not clearly made out that this is always the case.

Inhibition.—When an impulse is sent along a nerve to a nerve center, if the latter be in a quiescent or unoccupied state, it will transmit outwardly to an organ a reflex impulse. A nerve transmitting an impulse toward a center is called an *afferent*, while one which conveys an outward impression toward an organ, or toward the periphery, is called an *efferent* nerve. When, however, a nerve center is preoccupied, and an afferent impulse is sent to it, which would ordinarily be reflected along an efferent nerve, it is not so reflected, or only in a much diminished degree. This peculiar action of arresting a nervous current is called *inhibition*, and is constantly playing a most important part in the distribution of nervous force to all the different parts of the complicated animal mechanism. For example, if the central end—the end toward the brain or, to speak more definitely, toward the medulla oblongata (see BRAIN, *ante*)—of a divided pneumogastric nerve be stimulated when the respiratory center is engaged in its accustomed rhythmic action of sending out impulses of inspiration and expiration, one of two things will happen, viz.: either the respiratory movements will be slowed or stopped entirely, or they will be accelerated. One explanation of the difference of action is that the pneumogastric nerve contains among its afferent fibers two sets, which, on account of original structure or of their connections, will, in one case, stop impulses, while in the other they will be accelerated. The retarding or stopping set are called inhibitory, while the others are called accelerating fibers. It must be confessed, however, that this is simply

an "explanation." The most striking instance of inhibition is offered by the heart. If the pneumogastrics be divided in an animal while the heart is beating regularly, and the outer end of the divided nerve is stimulated for a short time with the interrupted (Faradic) galvanic current, the heart will be almost instantly brought to a stand-still, and it will not resume its pulsations for some time. The beats, when they reappear, are at first feeble and infrequent, but soon reach the standard, or even go beyond it. The inhibitory action in this case has been estimated to be about .16 of a second. Other stimuli than the interrupted current may be employed, such as mechanical irritation and chemical stimuli. The action of atropine is remarkable. When injected into the blood, stimulation of the pneumogastric nerve with powerful galvanic currents will produce no inhibition. In order to understand this subject better it will be proper to say a few words about *vaso-motor nerves.* In mammals, if the cervical sympathetic nerve be divided, it will be found that the minute arteries of the head on the same side have become dilated, and that an increased amount of blood is circulating in them. If a rabbit be the subject of the experiment it will be seen that the whole ear of the side operated on will be much redder than natural. All the minute vessels, both arteries and veins, become greatly dilated and the temperature will rise more than one degree. Division of the sciatic nerve in the mammal causes a dilation of the arteries of the leg and foot, and the temperature will rise several degrees. Division of one of the splanchnic nerves (nerves arising from sympathetic ganglia in the thorax) produces dilation of the blood vessels of the intestines and other abdominal viscera. If a nerve supplying a muscle is divided, there immediately follows a considerable increase of flow of blood from the muscle, showing that its blood vessels have become dilated. The act of dilation may be easily seen with the microscope in the frog. There are, indeed, in all parts of the body certain vascular areas, which have such a relation to certain nerves that they become dilated on division of one of the nerves. These nerves are ordinarily called *vaso-motor nerves.* It is not intended by this designation to indicate that they are vaso-motor in an exclusive sense, possessing essentially different properties or structure from other nerves, but that they are nerves which have a vaso-motor function, because they are distributed to organs where vaso-motor functions can be performed. It has been a matter of discussion as to whether the origin of the vaso-motor nerves is in the spinal cord or in the sympathetic system. From their being so usually traced to sympathetic ganglia it was supposed for a time that they had a sympathetic origin, but careful researches have demonstrated their origin in the cerebro-spinal centers. One remarkable fact in regard to the vaso-motor nerves is that, although a section of their fibers produces dilation in the vessels supplied by them, irritation of the ends (peripheral) connected with these vessels does not always restore their caliber by constriction; but dilation may be increased by irritation in some cases, while constriction is produced in others.

If an animal is placed under the influence of curari (q.v.), and the central end of a divided sciatic nerve stimulated, an increase of blood-pressure will be observed, caused by the constriction of certain arteries, particularly those supplied by the splanchnic nerves; and, in general, the stimulation of any nerve containing afferent fibers will produce increase of pressure in the blood vessels, thus affording a test for the presence of afferent fibers in any nerve. If the animal is placed under the influence of chloral instead of curari, there will be a diminution of blood pressure instead of an increase on stimulation of an afferent nerve. These experiments suggest that the dilating or constricting results of stimulation depend upon the condition for the time being of the central nervous system, and this has led to the explanation of the two phenomena by means of the inhibitory nervous functions. This explanation, however, seems to fail in those cases where irritation of the peripheral end of a divided nerve produces either dilation or constriction, according to circumstances. Therefore, it has been supposed that there are vaso-motor nerves which have a dilating, and others which have a constricting, function. An interesting example is afforded by the submaxillary gland, which is supplied with two nerves, one being distributed to the salivary duct and its branches, and the other to the blood vessels. No marked effect is produced by simple section of either nerve, but when they are stimulated remarkable results follow, the ducts of the gland becoming greatly dilated, while the arteries are in an equal degree contracted. A question as to whether there is a vaso-motor center has for some time been a subject of investigation, but no definite conclusions have been obtained. Experiments show that the medulla oblongata, which is the center of so many reflex actions, is also a center of a large number of reflex vaso-motor functions, but it is also found that various parts of the spinal cord are centers of reflex vaso-motor functions; and it is probable that vaso-motor action is connected with an arrangement of nerve fibers and centers similar to that of the general reflex system. Whether there are automatic vaso-motor centers, those in which impulses are generated independently of reflex action, has not been determined, but it is probable that there are, if we consider the effects of certain emotions, such as blushing and pallor.

The pneumogastric nerve (see NERVOUS SYSTEM, *ante*) has the most remarkable course, the greatest number of connections, and the most varied functions of any of the cranial nerves. It arises in the medulla oblongata by a purely sensory root, but communicates with five motor nerves in its course, and is distributed extensively to muscular tissue both of the voluntary and involuntary kind, to striated muscles and to non-striated, whether belonging to blood vessels, intestinal walls, or glandular ducts. It presents two

ganglionic enlargements in its course—one at its exit from the cranial cavity by the jugular foramen, which is called the ganglion of the root; the other, a grayish enlargement, from half an inch to an inch in length, called the ganglion of the trunk. It is a plexiform structure, composed mainly of white and gray fibers and nerve cells. The most important communication, or addition, which the pneumogastric receives is a branch from the spinal accessory, for it has been shown that the larynx is supplied by filaments derived from this branch. Other communications are received between the root and the ganglion of the trunk, the most important of which are those from the superior cervical ganglion of the sympathetic. The filaments are short, and bind the sympathetic ganglion to the trunk of the nerve. Other filaments are received from other sympathetic ganglia, so that the pneumogastric becomes a mixture of sympathetic and cerebro-spinal nerves. What mysterious purpose is served by this mingling is not known; probably qualities are given to the nervous influence of certain fibers, similar to those which are sometimes produced in galvano-electric machines by certain combinations of conductors and magnets, producing variations in intensity or in quantity, and also, perhaps, other qualities which are unknown. The most important branches of the sympathetic are: 1, auricular; 2, pharyngeal; 3, superior laryngeal; 4, inferior laryngeal; 5, cardiac; 6, pulmonary; 7, esophageal; 8, abdominal. The pneumogastrics are generally alike in their distribution in either side of the body, with the exception of the inferior laryngeal and abdominal branches. Passing by the differences in the former, it may be stated here that the left abdominal branch supplies innervation to the muscular walls and the mucous membrane of the stomach; numerous branches also supplying the liver, in its course anastomosing with branches of the right abdominal and of the sympathetic. The right pneumogastric, which is situated more posteriorly, sends a few filaments to the stomach, but is principally distributed to the liver, spleen, kidneys, supra-venal capsules, and (the most important difference) to the whole of the small intestine. Before the nerves pass to the intestines, however, there is a free interchange of fibers between the left and right abdominal branches.

NESHO'BA, a co. in e. Mississippi, intersected in the n. by the Pearl river; 573 sq.m.; pop. '80, 8,741—8,713 of American birth. Its surface is hilly, a large proportion covered with forests and uncultivated. The soil is fertile, and especially in the n. yields good crops of cotton, corn, wool, sweet potatoes, tobacco, and sorghum. Much attention is given to stock-raising, and large numbers of cattle, sheep, and swine are raised. Co. seat, Philadelphia Court-House.

NESS (identical with Eng. *nose*, A.-S. *næse*, Ger. *nase*, Ice. *nes*, Lat. *nasus*, Fr. *nez*), a geographical termination, signifying promontory. Names in *-ness* abound among the Orkney and Shetland islands, and on the coast of Caithness; and they occur, though less frequently, along the e. coast of Great Britain, as far as Dungeness in Kent. As the corresponding Scandinavian termination *-naes* prevails in the names of promontories in Norway, Sweden, and Denmark (e.g., Lindesnaes, in s. of Norway), the existence of names in -ness in Britain is held as an evidence of Scandinavian and Danish colonization. Grisnez, on the n. coast of France, points to the same source.

NESS, a co. in central Kansas, drained by the North fork, the South fork, and Walnut creek, all affluents of the Arkansas river; 900 sq.m.; pop. '80, 3,722—3,422 of American birth, 2,186 colored. Its surface is mostly prairie land, furnishing good pasturage for cattle all the year round, and sheep are extensively raised. Its soil is productive, and it is thinly timbered. Co. seat, Ness Court-House.

NESS, Loch, a long narrow lake in Inverness-shire, Scotland, extends n.e. and s.w., and is 23 m. in length, and 1¼ m. in average breadth. Its n.e. extremity reaches a point 6 m. s.w. of the town of Inverness. It receives the Morriston, the Oich, the Foyers, and other streams, and its surplus waters are carried off to the Moray firth by the river Ness. It lies in the valley of Glenmore, and is inclosed by mountain masses averaging 1000 ft. in height; but the scenery on its banks is not strikingly picturesque. In many places it is about 130 fathoms in depth, and owing to the length of time which this immense body of water takes to cool down to the freezing point, ice never forms to any considerable extent.

NESSELRODE, Karl Rob., Count, one of the most eminent diplomatists of modern times, was b. Dec. 14, 1780, at Lisbon, where his father, a descendant of an ancient noble family on the lower Rhine, was then Russian ambassador. He early devoted himself to a diplomatic career, gained in a high degree the esteem and confidence of the emperor Alexander, and in 1813 was one of the representatives of Russia in the important negotiations which took place between the powers who combined against France. In 1814 he accompanied the Russian emperor to France, and on Mar. 1 signed the treaty of the quadruple alliance at Chaumont. He was also one of those who concluded the treaty with marshal Marmont for the surrender of Paris. He continued to take a principal part in all the negotiations which ended in the peace of Paris; and was one of the most prominent and active of the plenipotentiaries in the congress of Vienna. He was one of the most active diplomatists of the holy alliance, and accompanied the emperor Alexander to the congresses of Aix-la-Chapelle, Troppau, Laibach, and Verona. The emperor Nicholas reposed in him the same confidence, and under his

reign he conducted the Russian policy in the affairs of Greece and Turkey. Amidst the European convulsions of 1848 and 1849, Russia, under his guidance, refrained from interference, till opportunity occurred of dealing a deadly blow to the revolutionary cause in Hungary; and, at the same time, of bringing Austria very much under Russian influence. Being one of the chiefs of the German or moderate party in Russia, Nesselrode is supposed to have exerted himself strenuously to preserve peace with the western powers; and after the war had broken out in 1854, and the ill success of Russia was manifest, he undoubtedly strove for the re-establishment of peace, and for the assembling of a congress to settle all disputes. After the accession of Alexander II. he retired from the direction of foreign affairs, and was succeeded in that department by prince Alexander Gortchakov, but retained the dignity of chancellor of the empire, and a seat in the ministerial council. He died at St. Petersburg, Mar. 23, 1862.

NESSUS, in Greek mythology, a centaur who carried travelers over the river Evenus, and who insulted Deïanara, the wife of Hercules, and was killed by the latter. In revenge he told the woman to collect the blood from his wound and use it as a love philter, and when she afterwards poured it on Hercules's tunic, the poison communicated to the blood by the arrow dipped in the hydra's venom so tortured the hero that he sought death on a funeral pile. Hence the use of the word to denote a fatal present or that from which there is no escape, as "the Nessus-shirt of ridicule," (Rénan).

NEST-BUILDING APES. Reference was made, but with some hesitation, in the article GORILLA, to certain new species of apes of the same genus with the chimpanzee and gorilla, said to have been discovered by M. du Chaillu in western Africa. The complete vindication which has since taken place of that traveler's reputation as a truthful and trustworthy observer, makes it necessary to give some further notice of these now unquestioned discoveries, exceedingly remarkable on account of the habits of some of the animals. To protect themselves from the rain, they construct nests, or rather umbrellas, among the branches of the trees, of long branches and leaves laid one over the other very carefully and thickly, so as to be "capable of shedding water." The branches are fastened to the tree in the middle of the structure by portions of the stems of twining shrubs, abundant in these forests. When the leaves dry, so that the structure no longer keeps out the rain, the owner builds another shelter; and Du Chaillu says this happens once in ten or fifteen days. The nest-building ape (*troglodytes calvus*, called nshiego mbouve by the natives) is nearly four feet in length. Du Chaillu supposes this ape to rest all night on a projecting branch under its nest or umbrella, with an arm round the stem of the tree for security. The nests are generally constructed about 15 or 20 ft. from the ground, and invariably on a tree which stands a little apart from others, and which has no limbs below the one in which the nest is placed, probably in order to insure safety from serpents and other animals. These apes inhabit the most lonely parts of the forests. The nests are never congregated together, so that this ape does not seem to be gregarious. It feeds on fruits.—Du Chaillu discovered a second species of nest-building ape on his second visit to the Ogobai, very similar to the *troglodytes calvus*, but which constructs its nest in a somewhat different fashion. It is called nshiego nkengo by the natives. It makes its nest or shelter at the height of about 20 or 30 ft. from the ground, by bending over and intertwining a number of the weaker boughs, the foliage of which forms its protection from rain.

NES'TOR, according to ancient Grecian legend, the son of Neleus and Chloris, b. in the Messenian Pylos, escaped destruction when Hercules slew all his brothers, being then a dweller among the Geronians, with whom he was brought up. He married Eurydice, by whom he became the father of a numerous family. In his youth he was distinguished for valor in wars with the Areadians, Eleians, and the centaurs, and in his advanced age for wisdom. Although he was an old man when the expedition against Troy was undertaken, he joined it with his Pylians in sixty ships. Homer makes him the great counselor of the Grecian chiefs, and extols his eloquence as superior even to that of Ulysses. His authority was even considered equal to that of the immortal gods. Nestor returned in safety to his own dominions after the fall of Troy, along with Menelaus and Diomedes, and continued for long to rule over the people of Pylos.

NESTOR, 1056–1114; b. Russia; entered a convent at Kiev in 1072. He wrote, in the old Slavic dialect, the chronicles of Russia, from about 850 to his own times.

NESTO'RIANS, a sect of the 5th c., so called from its founder NESTORIUS, under which head their distinctive doctrine, as well as their history up to the time of its condemnation, are sufficiently detailed. Of the later history it will be enough to say that, even after the council of Ephesus, Nestorianism prevailed in Assyria and Persia, chiefly through the influence of the well-known school of Edessa. Although vigorously repressed in the Roman empire, it was protected, and probably the more on that account, by the Persians, and ultimately was established by king Pherozes as the national church, with a patriarch resident at Seleucia; its fundamental doctrine as laid down in the synod of Seleucia in 496, being the existence of two distinct persons as Christ, united solely by a unity of will and affection. Under the rule of the caliphs, the Nestorians enjoyed considerable protection, and throughout the countries of the east their community extended itself. Of their condition in central Asia, during the mediæ-

val period, some account will be found under the head of PRESTER JOHN. In the middle of the 12th c., their church reckoned no fewer than 90 bishops under regular metropolitans, together with 56 others, whose special dependencies are unknown; but in the destructive career of Tamerlane, they shared the common fate of all the representatives of the eastern civilization. In the 16th c. a great schism took place in this body, of which a portion renounced their distinctive doctrine, and placed themselves under the jurisdiction of the Roman pontiff, to whom, under the title of Chaldean Christians, they have since remained faithful. The others still maintain their old creed and their ancient organization. Their chief seat is in the mountain ranges of Kurdistan. They are at present a poor and illiterate race, numbering about 140,000, and subject to a patriarch residing at Diz (who is always chosen from the same family, and takes invariably the name of Schamun, or Simon) and 18 bishops. All these are bound to observe celibacy, but marriage is permitted to the priests and inferior clergy. Their liturgical books recognize seven sacraments, but confession is infrequent, if not altogether disused. Marriage is dissoluble by the sentence of the patriarch; communion is administered in both kinds; and although the language of the liturgy plainly implies the belief of transubstantiation. yet, according to Layard, that doctrine is not popularly held among them. The fasts are strict and of very long duration, amounting to very nearly one-half of the entire year. They pray for the dead, but are said to reject the notion of purgatory, and the only sacred image which they use or reverence is that of the cross. The Nestorians of Kurdistan, like the Christians of the Lebanon, have suffered much from time to time through the fanaticism of the wild tribes among whom they reside. In a massacre in 1843, and again in 1846, many fell victims, and even still they owe much of their security to the influence exercised in their favor by the foreign representatives at the Turkish and Persian courts.

There is another body of Nestorians who have existed in India from the period of the early migrations of the sect, and who are called by the name of Syrian Christians, Their chief seat is in Travancore, where they number about 100,000. Among both bodies of Nestorians, European missionaries, Catholic and Protestant, have of late years endeavored to effect an entrance. See Perkins's *Residence of Eight Years in Persia among the Nestorian Christians* (Andover, 1843); Anderson's *Oriental Churches* (1872); and Dean Stanley's *History of the Eastern Church.*

NESTORIANS (*ante*) claim to have existed as a sect prior to Nestorius, and date their conversion to the preaching of the apostle Thomas. They have also a tradition that they are descended from the patriarch Abraham, and hence are sometime called Chaldeans. It is admitted that they are the oldest of the oriental Christian sects. And though they have some superstitions and doctrinal errors, yet they retain many of the doctrines and authorized usages of the early church of Christ. Notwithstanding the deposition of Nestorius, his writings and those of Theodore of Mopsuestia were translated into Syriac, were circulated in Assyria and Persia; and made many converts. When emperor Theodosius II. expelled from his dominions all who refused to accept the Ephesian decision, Nestorianism was transferred to those countries where it has held its ground to the present day. In 435 was established the famous school of Edessa, and from it went many disciples of the new doctrine. Of these the most celebrated was Barsumas, bishop of Nisibis, who did much to propagate Nestorian views in Persia. He and Maanes, bishop of Ardaschir, prevailed upon the Persian king Feroze to expel those Christians who favored the decision of Ephesus, and establish the Nestorians as the national church for the Christians in Persia. Thus patronized by the state, they made Seleucia the seat of their patriarchate, which from that time to the present has been held by the patriarch of the Nestorians. They also established a theological seminary at Nisibis. So great were the zeal and success of Barsumas that the Nestorians now in Chaldea, Persia, Assyria, and the adjacent countries, regard him as their founder. Mosheim says, "It appears from unquestionable documents still existing that there were numerous societies in all parts of Persia, in India, in Armenia, in Arabia, in Syria, and in other countries under the jurisdiction of the patriarch of Seleucia during the 6th century." Of the 7th c., he says, "The Christian religion was in this century diffused beyond its former bounds, both in the eastern and western countries. In the east the Nestorians, with incredible industry and perseverance, labored to propagate it from Persia, Syria, and India, among the barbarous and savage nations inhabiting the deserts and the remotest shores of Asia. In particular the vast empire of China was enlightened by their zeal and industry with the light of Christianity." Considering it necessary to express fully their views, a system of doctrine was adopted at a synod convened by the patriarch Badæus in 496 at Seleucia. The characteristics of this were that in Christ there were two persons, the divine Logos, and the man Jesus; that these two hypostases had only one outward appearance; that the union between the Son of God and the Son of man took place at the moment of the Virgin's conception, and is never to be dissolved; that these two persons are united by no other connection than that of will and affection; that Christ on that account ought to be clearly distinguished from God; that Mary is to be called the mother of Christ. *Christotokos*, and not the mother of God, *Theotokos.* They asserted also that these tenets had not been derived from Nestorius, but had been held by the church from the beginning. Another peculiar opinion was that it was lawful for bishops and presbyters

to marry. At the end of Cavades's reign in the 6th c., a schism occured among the Nestorians, which lasted 12 years, when two patriarchs, Nerses and Elisæus, were elected by the opposing factions, each of whom appointed bishops from his own followers. After the death of Nerses in prison and the deposition of Elisæus, the bishops elected Mar Aba I., or *the great*, a Magian convert, 536–552. He translated the liturgy of the Nestorians from the Greek into Syriac, making the version now in use among the Nestorians. He was very active in restoring discipline in the church, and held a synod in 544 which declared that the patriarchs and bishops should thenceforth not be allowed to marry, a regulation ever since observed. He also ordered that while conforming to the Nicene creed, the system of Theodore of Mopsuestia should form the basis of biblical interpretation. Nestorianism was regarded with favor, or at least with toleration under the Saracens, Arabs, and Tartars, the successive masters of Persia. The Nestorians spread not only in Arabia, Syria, and Palestine, but under Mar Aba II., 742–752, a bishop was appointed for them in Egypt. He was subject to the see of Damascus: in later times they had a metropolitan of Egypt. After Bagdad became the abode of the caliphs the patriarch also resided there in A.D. 762. The patriarch was called *yazelich*, i.e. *catholicos*, and in the 13th c., he had 25 metropolitans under his supervision. A historian says: "The Nestorians had now become widely extended. They occupied almost to the exclusion of other Christian sects the region which forms the modern kingdom of Persia, in all parts of which they had churches. They were numerous in Armenia, Mesopotamia, and Arabia. They had churches in Syria and in the island of Cyprus. They had churches among the mountains of Malabar in India. They had numerous churches in the vast region of Tartary from the Caspian sea to mount Imaus, and beyond, through the greater part of what is now known as Chinese Tartary, and even in China itself." Early in the 11th c. Unkh Khan, a Tartar prince on the northern borders of China, invited Nestorian missionaries among his people, and himself became the famous Prester John. Genghis Khan and several of his sons and grandsons, who conquered China and almost all Asia and a part of Europe, were connected with Prester John by marriage. Several of them had Christian wives, and one of them professed himself a Christian. Under some of this dynasty central Asia was comparatively civilized and enlightened; and Christian travelers passed with safety from the banks of the Euphrates to Samarcand and Pekin. Some of the Chinese emperors favored Christianity and ordered the erection of numerous churches. Meanwhile the sword of Moslem fanaticism advancing eastward Bagdad fell before it, and all the country on the Euphrates, then Persia and the regions to the north. The Nestorian church was crushed, and its missions languished; and about the year 1400 Tamerlane swept like a whirlwind over the remains of Nestorian Christianity. The missions in China languished for want of support, and were weakened by controversies with missionaries from Rome; but some of the churches still existed, and in 1502 four bishops were sent to China.

In 1551 a dispute arose among the Nestorians concerning the election of a patriarch. One party elected Bar Mama; the other, who chose Sulaka, placed themselves under the Roman pontificate, and called themselves Chaldean Christians. Sulaka was sent to Rome to be ordained, but on his return he was made prisoner in Amid, and killed in prison. Another was appointed in his place. In 1684 pope Innocent XI. appointed a patriarch, who resided in Diarbekir, and took the name of Joseph, which is retained by his successors. The number of Chaldean Christians is about 20,000, scattered from Diarbekir to the frontiers of Persia and from the borders of Tyari to Bagdad—a district which once contained a vast number of Nestorians. This portion of the Nestorians is governed by a patriarch and six bishops, who have lately been pensioned by the propaganda. They have no independent existence, but are a section of the Roman church. They have no standard confession of faith. The patriarch of the other party is called Simeon, and resides in the mountains of Kurdistan. These are the two representatives of the primitive Nestorian church in Persia.

The Syrian or Nestorian Christians of St. Thomas profess to be his disciples, and say that he preached the gospel in Malabar and other parts of India. However that may be, there is evidence that the Syrian or Nestorian churches in Malabar were founded as early as the 5th or 6th century. The first notices of this people in recent times are found in Portuguese histories. When they arrived in India in A.D. 1500, they found not only a Christian king, but many professing Christians, and more than 100 churches. The popes claiming universal spiritual supremacy endeavored to bring them into subjection, and directed the Portuguese to use all their power to convert them. In 1545 a Franciscan friar was sent out who opened schools to educate the youth in the doctrines of their church. The Syrian bishop, Mar Joseph, was taken a prisoner to Goa, and thence sent to Portugal. Mosheim says, "The finishing stroke was put to the violence and brutality of these attempts by Don Alexis de Menezes, archbishop of Goa, who at the close of the 16th century, calling the Jesuits to his assistance, compelled this unhappy people to embrace the religion of Rome, and to acknowledge the pope's supreme jurisdiction." The result of these efforts was that the priests and churches on the sea-coast submitted to the pope, insisting, however, on retaining their language and liturgy. These are called the *Syrio-Roman Christians*. But those in the interior would not yield. After a brief show of submission they proclaimed war against the inquisition, hid their books,

fled to the mountains, and sought the protection of the native princes. These retain their ancient rites, liturgy, and ministry, and are called by their former name *the Syrian Christians of Malabar*. Little was known concerning them in Europe and America until Dr. Buchanan published his account of them in 1807. He found near Travancore the Syrian metropolitan and his clergy, and there were 55 churches. They used the liturgy of Antioch in the Syrian language. They had many old and valuable copies of the Scriptures, one of which, a Syrian manuscript of great antiquity they presented to him. He describes their doctrines as few in number, but agreeing in essential points with those of the church of England. The church missionary society subsequently had a mission among them, but without much success. The Syrio-Roman Christians are said to number about 100,000, the others 50,000.

In 1830 Messrs. Smith and Dwight, missionaries of the American board, visited the Nestorians of Persia. From their *Researches* we learn that they occupy a wild range of the Koordish mountains on the borders of Turkey and Persia. They are governed by *meliks* or kings chosen from their own people by a popular vote. Every melik or head of a small clan is perfectly independent, except as they yield a voluntary obedience to their patriarch, Mar Simon, who resides near Joolamerk, and styles himself "patriarch of the East." The Turkish government has long sought to subdue them. They are very poor, and in the summer many descend to the plain of Oroomiah at the foot of the Kurdistan range, where now dwell a large body of Nestorians, numbering about 40,000. They are bold, generous, and kind. The patriarch professes only spiritual power, but among the mountaineers his word is law in all things. He seldom visits those of Oroomiah. Under him are 18 bishops, 4 of whom reside in Oroomiah. Celibacy is not required of the inferior clergy, who generally are poor, eking out a living by cultivating the ground, or teaching a few scholars. Some of them can scarcely read, but they have improved since the distribution freely among them of the Syriac bible. Religion is very low. Lying, intemperance, profanity, and some other vices, are common. Sunday is a holiday. Roman Catholic agents seek to seduce the Nestorian Christians, and even the patriarchs, to submission to the pope. A Jesuit a few years ago offered the patriarch $10,000 if he would acknowledge the Roman supremacy. The Mohammedans also endeavor to proselyte. These poor people are greatly oppressed with taxes, and are the victims of spoliation, and have no redress even in the courts. A Nestorian is not allowed a place in the bazaar, cannot engage in commerce, and in the mechanic arts cannot rise to a higher position than that of a mason or carpenter. In 1843 they rebelled and a general massacre took place. The Nestorians acknowledge the supreme authority of the Holy Scriptures, and hold that no doctrine or practice is essential to salvation, which cannot be proved from them. They have no pictures or images in their churches. The only symbol among them is a plain Greek cross, which they highly venerate.

In efforts to reach pagan and Mohammedan people with Christian truth, it is often found that the remnants of ancient Christian churches existing among them, and sometimes in political subjection to them, have substituted the forms of religion for its reality, and are in almost as much need of enlightenment as those by whom they are overborne. It has seemed that the renewal of those churches in moral and spiritual life, would provide the best means of Christianizing the races with whom they are in contact. With these aims the rev. Mr. Perkins and his wife were sent in 1833 by the American board to Persia to begin mission work among the Nestorians. Dr. Grant and his wife joined them in 1835. The bishops and priests of the Nestorian church for the most part received the missionaries cordially, and encouraged their efforts for the reformation, admitting that their people had wandered far from the right way. They even in some instances put themselves under instruction, and prepared to co-operate with them, following their example in giving expositions of Scripture, which they had never ceased to consider the ultimate standard of truth. Mrs. Grant by her school awakened great interest in the education of women. Dr. Grant not only was highly useful as a physician and surgeon, but gained great influence for the truth through this means. A boarding school for girls under the care of Miss Fidelia Fisk and a high school for boys under that of professor Stoddard, where hundreds of young men and women have received Christian training, have been highly useful. The Mohammedans seeing what was undertaken for the Nestorians, said, "Are we to be passed by," and claimed a share in the generous labors of the missionaries. Eighteen ordained missionaries and their wives, 3 missionary physicians and the wives of two of them, and 1 male and 8 female assistant missionaries, have been employed in this work, and the success has been most gratifying. They had no printed Scriptures, now they have the Bible in both the ancient and vernacular. Spelling-books, geographies, arithmetics, and religious books, in all, 11,000 volumes have been printed, and 3 periodicals are circulated. Far and wide oral Christian instruction has been given. The benefit of spiritual religion is evinced in the daily life of many, and their example makes a most favorable impression. Seventy have become preachers of the gospel. The missionary spirit is growing, and several hundred dollars are contributed annually to carry the gospel to other peoples, the Nestorians themselves engaging in this work, and laboring among Moslems, Jews, Armenians, and Malakans of Russia. One of these Nestorian preachers has gained among the latter 1200 converts. Five are pastors of self-supporting churches. It was not the design

of the American missionaries to interfere with the established church organizations, but there have been formed "reunions on the apostolic basis," which include 767 members.

NESTO'RIUS, a native of Germanicia, a city of northern Syria, in the patriarchate of Antioch, was probably a disciple of the celebrated Theodore of Mopsuestia; and having received priest's orders at Antioch, became so eminent for his fluency, if not eloquence, as a preacher, and for grave demeanor and exemplary life, that on occasion of a dispute about the election of a patriarch of Constantinople he was selected by the emperor, in 428 A.D., to fill the vacant see. Soon after his consecration a controversy arose as to the divine and human natures of our Lord, in which Nestorius took a leading part. One of the priests, who followed Nestorius to Constantinople, Anastasius, having in a sermon, which was by some ascribed to Nestorius himself, denied that the virgin Mary could be truly called the "mother of God," being only in truth the mother of the man Christ, Nestorius warmly defended Anastasius, espoused this view, and elaborated it into the theory which has since been known by his name, and which equivalently, if not in formal terms, exaggerated the distinction of two natures in our Lord into a distinction of two persons—the human person of Christ and the Divine Person of the Word. An animated controversy ensued, which extended from Constantinople to the other patriarchates, and drew from Cyril, patriarch of Alexandria, a formal condemnation of the doctrine of Nestorius in twelve anathemas, still preserved, and a similar condemnation, accompanied by a threat of deposition and excommunication, from Celestine, bishop of Rome, unless he would withdraw the obnoxious doctrine. Nestorius remaining firm in his opinions, a general council was convened at Ephesus in 431, at which Cyril took the most active and prominent part, and in which, notwithstanding the absence of the patriarch of Antioch and his bishops, Nestorius was condemned and deposed. Considerable opposition was offered to this judgment for a time, but ultimately Nestorius was confined in a monastery near Constantinople, whence, after four years, still persisting in his views, he was banished to the greater oasis in upper Egypt, and after several changes of his place of confinement, died in exile. The account given by Evageius, that his death was caused by a disease in which his tongue was eaten by worms, rests, according to Evageius himself, on a single and unnamed authority. The more probable narratives ascribe his death to the effects of a fall. The date of this event is uncertain. It was after 439, when Socrates wrote his history (*Hist. Ecc.* vii. 34), but there is little doubt that he was already dead in 450, when the Eutychian controversy first began to attract notice.

NESTS (Lat. *nidus*, Gael. *nead;* allied to Ger. *nähen*, Sax. *nestan*, Lat. *nectere*, to sew, bind, or tie) are the structures which animals prepare for the rearing of their young. They are very different, not only when the creatures which construct them belong to widely separated divisions of the animal kingdom, but often when the animals are of the same class, or even when they are nearly allied; and whilst some construct very simple nests, and those of others are very curious and elaborately framed, some make no nest at all. Among MAMMALS the only nest-builders are certain rodents, as mice, dormice, squirrels, etc. The structures of some of the species are as artfully contrived and as beautiful as the nests of birds. It is among BIRDS that nest-making is most general; although there are not a few species which merely scrape a hole in the ground, and many sea-fowls lay their eggs on ledges of naked rock. The situations chosen by birds for their nests are very various, each species affecting some particular kind of situation, as each species also exhibits a uniformity in choice of materials and in form and mode of structure; these particulars, however, being all liable to modification—within certain limits—according to circumstances. Some birds' nests consist merely of a few straws or leaves collected together; some of such materials as twigs, straws, moss, hair, etc., very nicely interwoven, and often with a lining finer than the frame-work; some, as those of swallows, are made of clay or other soft material, which hardens as it dries. Birds' nests are generally open at top, but some, as those of swallows, are so placed under a projection of rock or of a building as to be covered, and have the opening at the side; whilst others are vaulted, and have the opening at the side. Some are situated in holes excavated in clayey, loamy, or sandy banks. The nests of troupials, baltimores, weaver-birds, etc., are remarkable for the ingenious contrivance displayed in them; and a very singular nest is that of the tailor-bird, made by sewing together the edges of leaves. These are noticed in the articles on these birds. Many birds are as solitary as possible in their nidification; whilst others, as rooks and herons, congregate in large communities.—No REPTILES are known to construct nests; their utmost approach to it being to make a hole for their eggs in sand, or in some other suitable situation.—The nests of FISHES have recently attracted much attention of naturalists. It is supposed that the ancients were acquainted with the nest-building instinct of some fishes; but it was unknown to modern naturalists till 1838, when Mr. Edwards discovered it in a species of stickleback (q.v.). It now gives interest to many a fresh-water aquarium. Not many fishes are yet known as nest-builders. Among them are gobies and the goramy. Many are known not to construct nests. The salmon and others exhibit an approach to the nest-building habit in making a place for their eggs in the sand or gravel which they choose for a spawning-bed.—Many INSECTS—a small proportion, however, of the whole number, and mostly

hymenoptera—construct nests, as bees, wasps, and ants. The nests of the social bees and wasps are also their ordinary habitations, but the nests of solitary bees are entirely devoted to their young. A few insects, not hymenopterous, as some weevils, may also be said to make nests; but among insects provision for the wants of the young is usually made in very different ways. Certain spiders, amongst which may be named the water-spider, construct nests.—The instinct of nest-making, connected as it is with the instinctive care for their young which the Creator has made so important a part of the nature of so many animals, is by no means an index either of that care or of the affection with which, in many cases, it is conjoined; and some of the animals which construct no nest are among those in which affection for their young is exhibited in the highest degree.—The nest-making instincts of animals seem to be a very essential part of their constitution; and even in the most perfect domestication are still retained and exhibited; although the accommodation to circumstances which is also manifested shows something—and that not inconsiderable—of reason.

NESTS. This subject is usually confined to the nests of birds, and most notices are based on *The Architecture of Birds* (Charles Knight, London, 1831), the original observations in which are by professor J. Rennie. The subjects of his treatment include ground-nesters, squatters, and miners; builders of mounds, of umbrellas, of domes; masons; carpenters; platform-makers; basket-makers; weavers; tailors; felters; cementers. But if we look at these divisions from the point of scientific classification, it will immediately be seen that the shape, size, and locality of the nest of any given species depend on its capacities, which will appear in its beak, wings, and claws; and on its habits, which may have been modified by a thousand considerations of climate, of companionship, or imitation. General influences as to the practice of particular species may be best drawn by the following classification, based on Cuvier, but partly Reichenbach, partly Willoughby.

1. Robbers	*a.*	Swoopers.	Eagles, hawks, vultures.
	b.	Stealers.	Owls, etc., etc.
2. Climbers		Woodpeckers.	Parrots, etc.
3. Scratchers	*a.*	Perchers.	Doves, etc.
	b.	Roosters.	Domestic fowl, partridge, etc.
4. Songsters	*a.*	Pinchers.	Fly-catchers, warblers, etc.
	b.	Swallowers.	Goat-suckers, swallows.
	c.	Crackers.	Larks, linnets, rooks.
	d.	Suckers.	Hoopoes, humming-birds, etc.
5. Stalkers	*a.*	Runners.	Ostrich, emu, etc.
	b.	Walkers.	Bustards, plovers, etc.
	c.	Fishers.	Herons, storks, cranes.
	d.	Pryers.	Curlews, snipe, woodcock, etc.
	e.	Scooters.	Rails, coots, flamingoes, etc.
6. Swimmers	*a.*	Divers.	Auks, penguins, etc.
	b.	Hoverers.	Petrels, gulls, cormorants, albatross, etc.
	c.	Waddlers.	Swans, geese, ducks.

But the desire of birds to build nests corresponds to that of men to make houses, or beasts to construct lairs. They are a shelter for the young, or a refuge for the old; as with mammals, the higher the order of intelligence, the more protection is needed by the young, so that the young eagle must have its food torn up for the first few weeks, while the young ostrich scuttles out of the sand almost ready to take care of itself from birth. Nor do birds' nests differ in shape, material, or adjustment from the works of insects, beasts, even crustaceans. The following is a summary of nest-builders, disregarding the minute divisions of the list of Rennie:

First, *Burrowers.*—First of mammals is the mole, so voracious, active, and fierce that if the creature had the size of one of the tropical *ferœ*, it may be questioned whether any animal has existed which could conquer it. The burrow is most complex of all, and the nest separate from the house. Then come shrews and musk-rats, the fox, all the weasels and badgers, chip-squirrels and woodchucks, and the rabbit. All have a distinct nest within the hole, and generally means of escape by extra passages. Burrowing birds: The sand-martin, the kingfisher, puffins, jackdaws, and sheldrakes; the stormy petrel, like all fish-eating birds, living in the midst of filth and stench; woodpeckers, the starlings and the creepers; the toucan, large of beak but small of strength, unable to excavate its hole in the knot of a tree. Reptiles, tortoises, crocodiles, and snakes, with all the crab kind of crustaceans, and the whole horde of boring mollusks. Scorpions and spiders, who have tunnels, towers, and trap-doors; insects, beetles, including the curious mole-cricket and the ant-lion; and all the numberless insects that bore into every article not made of metal or stone.

Second. *Hang-nests.*—The beautiful little harvest-mouse, one of the smallest mammals in the world, builds a true pensile nest, round, and, curiously enough, without opening. So does the squirrel, when he hangs his summer nest (for he makes two) from the end of

some slender bough, but these are almost the only animals light and active enough to rival the birds in this peculiar industry. Hanging-nests of all shapes—bottles, scoops, extinguishers; with tails, with concealed openings—belong in enormous variety to the tropical species; and in this country we all know the humming-birds, the orioles, the fly-catchers, and all the warblers. Among insects the best-known are the wasps; but many ants, the moths, and some spiders come into this category. There is one fish, but it seems wrong to include here the pupæ of insects.

Passing to the creatures which build, rather than burrow or weave, we have: Building mammals. Two Australian species only and our own musk-rat; but the birds are very numerous. The oven-bird, the blackbird, and the song-thrush, martins of all kinds, swallows of all kinds, the curious birds of Australia which hatch their eggs in mounds of rotting leaves and twigs; the titmice, wrens, the eastern lyre and bower birds. Among insects we have white ants and mud-building wasps. But a whole class of buildings may be separated and called sub-aquatic. Here belong fishes, the little stickleback and the hassar; but the most wonderful of all such creations may be seen in the depths of a pool. The water-spiders, caddis-flies, all pupa-cases and larvæ-nests; and here may be added corals, serpulæ and terebellæ. Social habitations, communities of creatures, whether all of the same species or mixed, by sufferance and by intrusion, are very common. The beaver, emblem of quietness and industry, is an example from mammals; but in birds we have the curious sociable-weaver of South Africa. Among insects, bees, hornets, some moths, some butterflies, and several curious kinds of ants, mostly from Africa. Parasitic nests, inhabited by the cuckoo and the cow-birds, the sparrow-hawk and the kestrel, crow-blackbirds, occasionally the sparrow and the stork. Among insects, whole families of flies pursue the luckless moths and caterpillars, making of their cocoons, or their living bodies, nests for the generation of a swarm of destroyers. Here come most of the gall-insects, the leaf-miners, and the parasite breeze-flies, and the curious companion of the snail, the drilus. Branch-builders are represented, as may be imagined, mostly by birds, yet we have among animals the dormouse and the loir; among birds, rooks, crows, herons, all finches, the eagle, the chat, the mocking-bird, the water-hen, some warblers, some humming-birds, some shrikes, and the hedge-sparrow. These all make open, usually round nests, on the fork of a branch, and woven of twigs or of miscellaneous trash. Here come also some spiders, many moths, and several species of strange nest-building insects. To sum up, a nest, visibly so, and for that purpose only, strikes us more commonly in birds than elsewhere, though upwards of one-half of them make no nest, and many others steal places already fitted to their use; but the fact is, many mammals have distinct and real nests; crustaceans and reptiles commonly construct them, and they are and must be the rule with all insects when undergoing the changes necessary to their development.

NESTS, Edible, an important article of commerce between the eastern islands and China, and of luxury in China, are the nests of several species of swallow (q.v.), of the genus *collocalia.* The best known of these birds, *C. esculenta*, is about 4½ in. in length, 11 in. expanse of wing, dusky black above, pale ash-color beneath. The nest is shaped like that of the common swallow, and adheres to a rock; vast numbers being found together—often in absolute contiguity—in caves of the eastern archipelago; as those of the same and allied species are in other islands of the East Indies. The nests themselves are formed of grass, sea-weed fibers, small leaves, etc., and are attached to the rock by a sort of bracket, made of a gelatinous substance, which is the part really eaten. This was formerly thought to be made of sea-weeds, but is now known to consist of saliva, which the swallow exudes from the salivary glands under the tongue. The nests are collected by means of ladders, and often by means of ropes, which enable the gatherers to descend from the summit of a precipice, like the rock-fowlers of the north. The gathering of the nests takes place after the young are fledged, thrice in a year. In the Chinese market the nests are sold for from £2 to £7 per lb., according to the quality, and they are, of course, used only by the most wealthy, chiefly for thickening rich soups. The imports at Canton are reckoned at 1200 piculs, or 168,000 lbs., representing about 8,400,000 nests. The nests are very wholesome and nourishing, but quite devoid of the peculiar properties which the Chinese ascribe to them. Five caverns at Karang, Bollong, in Java, contain 330,000 swallows, and yield annually about 500,000 nests. The Dutch export them to China. The nests weigh about half an ounce each.

NETH'ERLANDS, The Kingdom of, lies between 50° 43′ and 53° 36′ n. lat., and 3° 22′ and 7° 16′ e. long., is bounded on the n. by the North sea, e. by Hanover and the western part of Prussia, s. by Liége, Belgian Limburg, Antwerp, east and west Flanders, w. by the North sea. Its greatest length from n. to s. is 195 English m., and its greatest breadth from the w., on the North sea, to the extremity of Overyssel, on the e., 110 English miles. It contains 12,597 sq. miles. Pop., including the grand duchy of Luxemburg, 3,835,111. The following table gives the population, Jan. 1, 1872, the area of the provinces, including the reclaimed Haarlem lake, and the provincial capitals:

Provinces.	Area in Sq. Miles.	Pop. 1872.	Provincial Capitals.
North Brabant	1,960	435,262	's Hertogenbosch.
Gelderland	1,948	436,029	Arnhem.
South Holland	1,162	700,499	The Hague.
North Holland	1,050	591,338	Haarlem.
Zeeland	665	181,532	Middelburg.
Utrecht	532	175,037	Utrecht.
Friesland	1,253	300,257	Leeuwarden.
Overyssel	1,274	256,681	Zwolle.
Groningen	896	228,883	Groningen.
Drenthe	1,017	106,713	Assen.
Limburg	840	225,352	Maastricht.
	12,597	3,637,583	
Grand Duchy of Luxemburg	987	197,528	Luxemburg.
Total	13,584	3,835,111	

The pop. (Dec 31, 1880) had, exclusive of Luxemburg, increased to 4,060,580, averaging 317 to the sq. mile. In Drenthe it is 103, and in South and North Holland rises to 769 and 597; Utrecht, Limburg, and Zeeland being the next densely peopled. In 1871 the births amounted to 128,305, of which 4,599 were illegitimate. The average was 1 to 27.90. In North Brabant, 1 to 44.38; Gelderland, 1 to 30.04; South Holland, 1 to 22.73; North Holland, 1 to 24.23; Zeeland, 1 to 26.30; Utrecht, 1 to 21.43; Friesland, 1 to 36.24; Overyssel, 1 to 45.07; Groningen, 1 to 22.54; Drenthe, 1 to 32.03; Limburg, 1 to 37.44.

The leading places are Amsterdam, Rotterdam, Dordrecht, Alkmaar, Middelburg, Schiedam, Leyden, Delft, Gouda, Utrecht, Amersfort, Groningen, Meppel, Zwolle, Kampen, Deventer, Arnhem, Nymegen, Tiel, Gorinchem, 's Hertogenbosch, Tilburg, and Breda.

Physical Aspect.—The land is generally low, much of it being under the level of the sea, rivers, and canals, especially in North and South Holland, Zeeland, the southern part of Gelderland, and Friesland. Along the west coast, the low lands are protected from the sea by a line of sand-hills or dunes; and where that natural defense is wanting, strong dikes have been constructed, and are maintained at great expense, to keep back the waters. The greatest of these dikes are those of the Helder and of West Kapelle, on the east coast of Walcheren (q.v.), which require, each, upward of £6,000 annually to keep them in order. Engineers, called the officers of the Waterstaat, take special charge of the dikes and national hydraulic works, the expense of which is reckoned at about half a million sterling. A hilly district stretches from Prussia through Drenthe, Overyssel, the Veluwe or Arnhem district of Gelderland, the eastern part of Utrecht, into the Betuwe or country between the Maas and the Waal. This tract of country has many pretty spots, is of a light, sandy soil, well watered, and, when not cultivated, is covered with heath or oak-coppice. The greatest part of the Netherlands is very fertile, the low lands and drained lakes, called polders (q.v.), being adapted for pasturing cattle, and the light soils for cereals and fruits; but in some districts there are sandy heath-clad plains, extensive peat-lands, and undrained morasses, which industry is rapidly bringing under cultivation.

Islands, Rivers, Canals, Etc.—The islands may be divided into two groups, of which the southern, formed by the mouths of the Schelde and Maas, contains Walcheren, South and North Beveland, Schouwen, Duiveland, Tholen, St. Philipsland, Goeree, Voorne, Putten, Beyerland, Ysselmonde, Rozenburg, and the island of Dordrecht. The northern group contains the islands at the entrance of the Zuyder Zee and along the coasts of Groningen and Friesland, as Wieringen, Texel, Vlieland, Terschelling, Ameland, Schiermonnikoog, and Rottum. In the Zuyder Zee are Marken, Urk, and Schokland.

The chief rivers are the Rhine, Maas, and Schelde. Important branches of these are the Waal, Lek, Yssel, Roer, etc.

Water-ways are more numerous than in any other European country, the immense tracts of meadow-land and the fertile polders being girdled by large canals, and cut in all directions by smaller ones for drainage and communication. Those of most importance to the national trade are, the North Holland canal, constructed 1819 to 1825, to connect the port of Amsterdam with the North sea; the Voorne canal, from the n. side of Voorne to Hellevoetsluis, which shortens the outlet from Rotterdam; the South Willemsvaart, through North Brabant, Dutch and Belgian Limburg, from 's Hertogenbosch to Maastricht, being 71½ English m. in length, and having 24 locks. Besides these, there are numerous important canals, connecting rivers, and cutting the kingdom into a network of water-courses. To improve the entrance to the Maas, the Hoek of Holland has lately been cut. A new canal throuth the Y and peninsula of Holland was opened Nov. 1, 1876. It is nowhere less than 80 yards broad, with sluices nearly 400 ft. in length, and a depth of nearly 23 feet. This has reduced the distance from Amsterdam to the sea to about 16 m., and provides a safe way for large ships. The harbor, in 52° 29′ n. lat. and 4° 36′ e. long., is formed by piers of concrete built into the North sea. The expense, including the recovery of 15,000 acres of land from the Y amounted to about two millions sterling.

Railways had been constructed to the extent of about 1240 m., in 1882, forming communication between the principal cities of the Netherlands, and with Prussia to the s.e. and Belgian to the s. west. The receipts of the three main lines in 1872 amounted to £696,585. These belong to companies. The state railways realized £445,966, and carried 3,188,443 passengers. More than half of the entire system belongs to the state. There are about 350 telegraph offices conveying annually about 2,500,000 despatches.

Climate, Agriculture, Produce, etc.—The climate of the n. is variable, chilly colds often closely succeeding high temperatures, inducing various forms of fever and ague, and requiring peculiar care as to clothing, etc. In summer the thermometer sometimes rises above 80°, and even to 90° F. in the shade, and a winter of great severity usually occurs every fifth year, when carriages and heavily-laden wagons cross the rivers and the Y on the ice, and thousands enjoy the national pastime of skating.

The farms are generally small and well cultivated, though the implements are old-fashioned and clumsy. Much progress is being made in reclaiming the sandy wastes, in Drenthe and Overyssel, by planting them with fir and oak, and sowing buckwheat, oats, and rye. The best implements are also being gradually introduced from England, and the steam-plow was, in 1862, put in operation on the lands of the drained Haarlem lake.

The following table shows the agricultural products, with values for a good year according to government returns:

Wheat to the value of	£2,848,500
Rye	4,422,750
Barley	1,092,833
Oats	2,217,500
Beans	650,250
Peas	436,416
Buckwheat	815,583
Colza	675,666
Potatoes	4,309,916
Madder	277,583
Chicory	69,666
Flax	903,000
Hemp	45,833
Beet	393,666
Tobacco	169,163
Various	21,849
Total	£19,340,164

In 1874 the total value of agricultural products was about £17,500,000. In 1872 wheat occupied 211,960 acres; rye, 493,639 acres; barley, 111,811 acres; oats, 246,651 acres; potatoes, 312,329 acres; flax, 46,846 acres.

In 1872 the Netherlands possessed 247,900 horses, 1,377,000 head of cattle, 855,300 sheep, 139,500 goats, and 320,100 pigs. The leading agricultural products of Zealand are wheat and madder; in South Holland, madder, hemp, butter, and cheese: in North Holland, butter and cheese are extensively made, and cattle, sheep, and pigs reared and exported. The horses of Friesland, Zeeland, and Gelderland are of first-rate quality. The exportation of butter from Holland and Friesland, and of Edam, Leyden, Gouda, and Frisian cheese, is large; in 1873 the value of the exports of cheese was £1,013,233, of butter £1,453,875. Fruit is abundant, and in several provinces, as Gelderland, Utrecht, and Drenthe, much attention is paid to bees. In Haarlem and neighborhood, tulips and hyacinths are much cultivated, realizing a large annual amount. In 1874 the foreign trade in bulbs reached, in the district, £37,500. The inland sales realized £47,833. Wild ducks, snipes, plovers, and hares are plentiful; and there are also conies, partridges, pheasants, and deer—game forming an article of export.

Geology, Mineralogy, etc.—The Netherlands are of recent formation, and consist of an alluvial deposit, chiefly of a deep, rich clayey soil, superimposed on banks of sand, marine shells, and beds of peat and clay. It appears that at some distant period there had been a depression of the land below its former level, enabling the sea to burst through its sand-banks, submerge the land, and form new deposits. The higher districts are composed of sand-drift mingled with fertile earths, and resting on a bed of clay. Coal is worked in Limburg; and a soft sandstone, which becomes fit for building purposes after having been some time exposed to the atmosphere, is quarried in the southern part of that province, which has also pipe and other clays. Valuable clays for pottery, tile, and brick making, abound in the various provices.

Manufactures, Industries, etc.—The chief manufactures are linen, woolen, cotton, and silk fabrics; paper, leather, glass, etc. Leyden and Tilburg are famed for woolen blankets, wool-dyed pilot, fine cloths, and friezes; 's Hertogenbosch for linens and rich damasks; calicoes, shirtings, drills, table-cloths, striped dimities are made at Almelo, Amersfort, and in the leading towns of Overyssel. Good imitation Smyrna and Scotch carpets, and carpets of hair and wool, are manufactured at Deventer, Delft, Arnhem, Hilversum, Utrecht, and Breda; Turkey-red yarns, dyed silks, and silk stuffs at Roermond, Utrecht,

Haarlem, etc.; leather, glass, firearms, at Maastricht and Delft; iron-founding, rolling and hammering of lead and copper, cannon-founding are carried on at the Hague, etc.; and powder-mills at Muiden; Oudenkerk, Middelburg, 's Hertogenbosch, Amsterdam, Nymegen, etc., have important breweries, those of 's Hertogenbosch and Amsterdam manufacturing very large quantities. Waalwyk, Heusden, and surrounding districts, manufacture boots and shoes, of which Heusden sends to North and South Holland 1,000,000 pairs yearly. Gin is distilled at Schiedam, Delft, Rotterdam, and Weesp. Amsterdam has the largest diamond-cutting trade in the world, 10,000 persons depending on that branch of industry. Sugar-refining is largely carried on at Amsterdam, Rotterdam, and Dordrecht, from all of which sugar is exported to Russia, the Levant, and countries of Europe. Paper is chiefly made in Holland and Gelderland. The leading letter-type founders are at Amsterdam and Haarlem. Manufactures of every kind are being rapidly increased in number, and adding to the material prosperity of the Netherlands. The chief motive power is the windmill, which forms a never-failing element in the scenery; but of late years steam is becoming more general. In 1854 the steam-engines employed in factories were 464, with 7,980 horse-power; and in 1872 they amounted to 1822, of 21,403 horse-power, and the increase has since been going on.

Many people are employed in the immense inland shipping-trade which the canal network has fostered, there being, when the previous census was taken, 6,684 ships inhabited by families, or one inhabited ship to 81 houses. The houses were 542,295; families, 668,911. Fishing, not only in the inland waters, the coasts, and bays of the North sea, but also on the coast of Scotland, is vigorously pursued. In 1873 the total value of the herrings taken in the North sea was £127,660, 102 vessels having been employed; on the Netherlands coasts, to the value of £77,734; and in the Zuyder Zee and coasts were taken 87,331,950 herrings. The anchovy take, almost exclusively in the Zuyder Zee, amounted to 30,000 ankers, valued at about £58,750. There are productive oyster beds, besides extensive fishings of cod, ling, turbot, flounders, soles, shrimps, haddock, etc.; and from the rivers, salmon, eels, perch, etc.

Exports, Imports, Shipping, etc.—The Netherlands is peculiarly a mercantile as well as agricultural country; its merchants not only importing and exporting the products of their colonies and the surplus of their own country, but also those of other lands. The general imports (1875) were 6,520,217 tons; exports, 3,200,944 tons. The value of goods imported in '82, was £71,527,743, and of exports, £50,123,034, home produce; both were less in 1876. The leading exports are cheese, butter, refined sugar, flax, cattle, sheep, pigs, gin, garancine, etc.; the imports, manufactured goods, unrefined sugar, coffee, grain, iron, yarns, cotton, rice, gold, silver, tin, tea, indigo, silk, and woolen fabrics. The trade with Great Britain is large and varied, and carried on chiefly by steam-vessels.

In 1877, 8,166 vessels (of which 2,488 were Dutch), with a burden of 8,119,327 tons, entered Dutch ports; and 4,936 (of which 2,638 were Dutch), of 4,852,850 tons, cleared. The mercantile marine of the Netherlands at the end of Dec. 1882 comprised 837 seagoing vessels, with a tonnage of 356,783. The trade along the rivers, by Belgian and German ships, is large. In 1873 the goods passing up the Rhine amounted to 844,191 tons, and from Germany down, 1,538,080. This trade consists largely of grain, timber, and coal. Wheat carried up, 110,263 tons, and rye, 116,774 tons; down, 4,854 tons of wheat, and 10,355 of potatoes. Timber, upwards, 86,042 tons; downwards, 56,087 tons. Coal, 1,026,119; and iron, 31,119 tons.

Religion, Language, Education, etc.—At the last census (1879) there were 2,193,281 Protestants, 1,313,052 Roman Catholics, 68,003 Jews, and 5,193 to small sects. There were (Jan. 1, 1875) 2,034 Protestant ministers, of whom 1598 were Dutch Reformed; 2,062 Roman Catholic priests; and 168 Jewish congregations. The official estimate of the population at the beginning of 1878 gave the total at 3,924,792.

There are five dialects spoken respectively in Groningen, Friesland, Gelderland, Holland, and Zealand. These differ considerably from each other, and the Frisian is not at all understood by natives of the other provinces. The written language is the Dutch, that branch of the great Teutonic stock which preserves more of its original character than the rest of the same family. It possesses numerous words the same as Lowland Scotch, and bears a strong affinity to the old Saxon English, as the following Dutch proverb shows:

Als de wyn is in den man,
Is de wysheid in de kan.

The kingdom of the Netherlands has produced many great names in all branches of literature and science. Coster (q.v,), according to his countrymen, invented printing, Leeuwenhoek the microscope, and Huygens applied the pendulum. Out of a long list of distinguished names, may be mentioned those of Erasmus, Scaliger, Heinsius, Hugo de Groot (Grotius), Huygens, Leeuwenhoek, Vitringa, Boerhave, and the poets Hooft, Vondel, and Cats; whilst the writings of Van der Palm, Van Lennep, Des Amoire van der Hoeven, Haafner, Stuart, Van Kampen, and those of the poets Bilderdyk, Da Costa, De Bull, Van den Berg, ter Haar, and Hofdyk, show that literature is not waning. Exclusive of newspapers, there are 226 magazines and periodicals published in the Netherlands, of which 67 are religious, 42 on art, belles-lettres, and general literature, and 7 on antiquity, history, etc. Leading painters of the old Dutch school were Rembrandt, Gerrit (Gerard) Dou, Gabriel Metzu, Jan Steen, Paul Potter, Ruysdaal, Van der Helst;

and among those of the present century, Ary Schaffer, Koekoek, Schelfhout, Pieneman, Kruseman, Van Os, Craeyvanger, Ten Kate, Israels, Bles, Louis Meyer, Roeloff, Springer, etc., have distinguished themselves.

There are universities at Leyden, Utrecht, Groningen and Amsterdam; *athenæums* at Amsterdam, Deventer and Maastricht, the students attending which must be examined for degrees at one of the universities. Latin schools are in all the leading towns. The universities and athenæums have faculties of theology, medicine, philosophy, law, and letters. There are also the royal military and naval academy at Breda, and that for engineers and the India civil service at Delft; seminaries in several places for the training of the Roman Catholic clergy; and others, especially in Amsterdam, for those of the smaller Protestant sects; and many literary, scientific, and agricultural institutes.

Each community or parish must have, at least, one elementary school, supported from the local public funds, in which reading, writing, arithmetic, history, geography, etc., are taught. A higher class of schools includes also foreign languages. All are under government inspectors, and the teachers must undergo stringent examinations on all the branches before obtaining permission to teach. Many society or subscription schools are being erected all over the land, with a normal school at Nymegen, not under government surveillance, and including religious instruction, which is excluded from the national public schools. The members of these societies pay a yearly subscription and a small fee for each pupil sent by them to the school, a select number acting as managers. There are several national normal schools. By the instruction law of 1878, the state pays 30 per cent. of the public school expenditure. and the communes, 70 per cent. The attendance at school is about 1 to 8 of the population in winter, and 1 to 10 in summer. In Jan. 1872, 258,489 boys and 225,779 girls; in July, 237,685 boys and 218,729 girls were at public and private elementary schools, with 8,838 male and 2,251 female teachers.

Army, Navy, etc.—The strength of the army, in Europe (1884) was 2,326 officers and 62,684 men; of the Indian army, '78, 1480 officers, 37,800 men. It is composed of volunteers, and of one man for every 500, drawn by lot for five years' service. There is also a local force, called the schuttery, drawn by lot from those between 25 and 34 years of age, to assist in keeping order and peace, and in case of war, to act as a mobile corps, and do garrison duty. If attacked on the land-side, 90,000 men are required for the defenses, and if by land and sea, 106,000. The first, or Maas line of defense, is formed by Maastricht, Venlo, Grave, 's Hertogenbosch, Woudrichem, Geertruidenberg, Willemstad, Breda, and Bergen-op-Zoom. The second line is formed by Nymegen, Forts St Andries and Loevestein and Gorinchem. The inner line of Utrecht is formed by various forts from Faarden, Utrecht to Gorinchem, which, by inundations, can make the provinces of North and South Holland into an island. There are many other forts, batteries and strengths at the mouths of the rivers and along the leading ways, and a new line of defence was agreed upon in 1874.

The royal navy consisted (Dec. 31, 1884) of 107 men-of-war steamers, 24 of them ironclads. The sailors and marines numbered, in 1878, 8,470 officers and men, including 701 native East Indians. A large double-turret ship, with four 35-ton Armstrong guns, was added in 1876 to the iron-clads. Prince Frederick, uncle of the king, is admiral; the prince of Orange, vice-admiral; and his majesty is commander-in-chief of the land and naval forces.

Revenue, Expenditure, etc.—The revenue of 1878 was estimated at £8,539,530, and the expenditure at £9,849,941, the difference to be met from accumulated surpluses and the regular increase. The principal receipts were from direct taxes, excise, indirect taxes, import and export dues. Among items of expenditure were £883,300 for public works, chiefly railways; £2,250,000 for interest on the national debt; and £333,300 to improve the defenses. The India revenue for 1878 was estimated at £12,000,478; the expenditure equals the revenue. The East India colonies, which were a burden in the earlier years have long been profitable. Revenue of the N., 1884, £9,357,938; expenditure, £10,582,347.

From 1850 to and with 1874, there was paid off £25,376,218 from the national debt, lessening the annual interest by the sum of £784,709. The interest payable on the debt amounted in 1879 to £2,225,000. The material prosperity of the Netherlands is rapidly increasing, and a sum of probably not less than £300,000,000 is invested by Netherlands' capitalists in the funds of other nations. Public debt, 1882, £84,235,435.

The chief colonies are Java, Sumatra, Borneo, Celebes, the Spice Islands, and Papua or New Guinea, in the East; and Surinam, Curaçao, and its dependencies, in the West Indies, with factories on the coast of Guinea. Colonial pop. estimated at 24,386,991.

Government, Franchise, etc.—The government of the Netherlands is a limited constitutional monarchy, hereditary in the male line, and by default of that in the female. The crown-prince bears the title of prince of Orange, and attains his majority at eighteen, when he takes his seat in the council of state. The executive is vested in the king, with a council of state composed of twelve members, nominated by his majesty, and the ministers of the interior, foreign affairs, finance, war, the colonies, marine, and justice, the last named taking charge of ecclesiastical affairs through two administrators, or under-secretaries of state, for the Protestant and Roman Catholic churches. The legislative power is shared by the king and the two chambers of the states-general; the first chamber having 39 members, elected for nine years, by the provincial states, one-third of their

number retiring every three years. The second chamber has 80 members chosen by electors numbering, in 1882, 126,290, above 23 years of age, who pay from £1, 14*s.* to £9, 7*s.* of direct taxes, according to the size and importance of the electoral district. These are elected for four years, one-half of the chamber retiring every two years. For members of the town-councils, the electoral qualification is half the above sums. The members of both chambers must be 30 years of age before the day of election, and those eligible for the first chamber are the nobility. This exceedingly high franchise, which, in Amsterdam, is a higher direct tax than the rental qualification of Great Britain, makes an election a thing of no interest except to a few. In 1871, only 36.2 per cent. of the electors of North Holland gave their votes, and the maximum in any place was 66.9 per cent in Limburg, 62.5 in North Brabant, the average being 48.6.

The king nominates the governors of provinces, the burgemeesters of every city, town, or village, and a host of other officials. The cities, towns, and rural parishes are governed by a council, burgemeester (mayor or provost), and wethouders (aldermen or bailies). The council consists of from 7 to 39 members, according to the population, who are chosen for six years, one-third part retiring every two years. The council selects out of their number from 2 to 4 wethouders for six years, one-half retiring every third year. These with the burgemeester form the local executive. The law departments are the high council, the provincial courts of justice, those of the arrondissements and cantons; appeal in many cases being open from the lower to the higher courts.

History.—Nothing is known regarding the original inhabitants of the Netherlands; but about a century and a half before our era the people known as the Batavi came out of Hesse, where they were living in hostility with their neighbors, and settled down between the Rhine and the Waal. At this time the Frisians occupied the country n. of the Rhine to the Elbe. The Batavi and Frisians differed little in appearance, manner of life, and religion. They clothed themselves with skins, lived by fishing, hunting, and pasturing cattle, possessing horses, cows, and sheep; were faithful, open-hearted, chaste, and hospitable. The songs of the bards composed their literature and history. Warlike and brave, they selected their leader for his courage and prowess, were armed with the bow and a short spear. They worshiped the sun and moon, and held their meetings in consecrated woods.

The Romans having subdued the Belgæ, next attacked the Frisians, who agreed to pay a tribute of ox-hides and horns, but continued restless and rebellious. The Batavi became allies of Rome, paying no tribute, but supplying a volunteer contingent, chiefly of cavalry, which decided the battle of Pharsalia in favor of Cæsar, and formed a gallant band of the Roman armies in all parts of the empire. About 70 A.D. Claudius Civilis, a Batavian, whose original name has not been preserved, made a bold effort to overthrow the Roman power in Rhenish or Germanic Gaul, but he was finally compelled to sue for peace. Towards the close of the 3d c. began the inroads of the Franks, followed by the Saxons and other races; and in the 5th c. the Batavi had ceased to exist as a distinct people. The Franks continued to spread, and with them the Christian religion, Dagobert I., one of their princes, erecting a church at Utrecht, which, 695, became the seat of a bishopric. The Frisians were opposed to and the last to embrace Christianity, to which they were forcibly converted by Charles Martel. At the end of the 8th c. all the Low Countries submitted to Charlemagne, who built a palace at Nymegen, on the Waal. The feudal system now began to develop itself and expand into dukedoms, counties, lordships, and bishoprics, which the dukes, counts, and bishops, especially the counts of Holland and bishops of Utrecht, endeavored to enlarge and to rule over with as little submission to their superior as possible. The crusades weakened the power and drained the resources of the nobles and priesthood, so that, during the middle ages, cities began to assume importance, strengthen themselves with walls, choose their own rulers, and appear in the state meetings. In 1384 the county of Flanders passed, through marriage, to the duke of Burgundy, whose grandson, Philip the good, made it his special life-effort to form the Netherlands into a powerful kingdom. He bought Namur, inherited Brabant with Limburg, and compelled Jacoba of Bavaria to resign Holland and Zealand. Charles V., as heir of the house of Burgundy, inherited and united the Netherlands under his scepter, and the country attained to prosperity through the encouragements which he gave to commerce and shipping. Philip II., who succeeded his father, 1555, by his harsh government and persecution of the reformers excited the Netherlands to rebellion, which after a struggle of 80 years resulted in the firm establishment of the republic of the United Provinces. The founder of the independence of the Netherlands was William of Nassau, prince of Orange, called in history the silent, who freely sacrificed his own property, and put forth every effort to unite the discordant states of the south with those of the north in resisting the Spanish yoke. Retiring to Holland, and banding together several provinces for mutual defense, by an agreement made at Utrecht, 1579, he perseveringly opposed the efforts of Spain; and in 1609 the independency of the United Provinces (the boundaries of which nearly coincided with those of the present kingdom of the Netherlands) was virtually acknowledged by the Spanish king, an armistice for twelve years being signed at Antwerp, April 9 of that year. The struggle was renewed and carried on till 1648, when all the powers acknowledged the independence of the United Provinces by the treaty of Munster, while

the Belgic provinces, divided among themselves, remained submissive to Spain and to the Roman Catholic church.

Prince William the silent did not live to see his efforts for freedom crowned with success. Excited by religious fanaticism, and the hope of a great reward, Balthazar Gerard, or Guion, 1584, shot the prince in his house at Delft, from a narrow passage, as he was stepping from the dining-room to ascend an adjoining stair which led to the second floor. With the 17th c. the United Provinces began to advance in power and wealth, their ships visiting all parts of the world. Meanwhile the contest between the Arminians and Calvinists broke out, and raged with fury for many years; Grotius and others fleeing to other lands, and the statesman Oldenbarneveld suffering on the scaffold at the age of 72. The United Provinces were presided over by the princes of Orange till the troubles at the end of the 18th c. began the long European war, which the battle of Waterloo brought to a close. The national convention of France having declared war against Great Britain and the stadtholder of Holland, 1793, French armies overran Belgium, 1794; and being welcomed by the so-called patriots of the United Provinces, William V. and his family, Jan., 1795, were obliged to escape from Scheveningen to England in a fishing-junk, and the French rule began. The United Provinces now became the Batavian republic, paying eight and a half millions sterling for a French army of 25,000 men, besides giving up important parts of the country along the Belgian frontier. After several changes, Louis Bonaparte, June 5, 1806, was appointed king of Holland, but four years later was obliged to resign because he refused to be a mere tool in the hands of the French emperor. Holland was then added to the empire, and formed seven departments. The fall of Napoleon I., and dismemberment of the French empire, led to the recall of the Orange family, and the formation of the southern and northern provinces into the ill-assorted kingdom of the Netherlands, which in 1830 was broken up by the secession of Belgium. In 1839 peace was finally concluded with Belgium; but almost immediately after national discontent with the government showed itself, and William I., in 1840, abdicated in favor of his son. The Netherlands being moved by the revolutionary fever of 1848, king William II. granted a new constitution, according to which new chambers were chosen, but had scarcely met when he died, March, 1849, and the present king, William III., ascended the throne. The nation is prosperous, and on May 11, 1874, the twenty-fifth anniversary of the present king's reign was celebrated with great rejoicings.

A bill for the emancipation of the slaves in the Netherlands West India possessions passed both chambers Aug. 8, 1862, and received the royal assent. It decreed a compensation of 300 guilders for each slave, except those of the island of St. Martin, who were to be compensated for at 30 guilders each. The freed negroes may choose the place to labor, but must be able to satisfy the government officers that they are employed somewhere. This surveillance to continue during ten years. The law came into force July 1, 1863, and in Surinam and all the other colonies the day passed quietly over. Those, however, interested in agriculture have sent an address to the minister of the colonies, protesting against the high-wages tariff as hostile to the successful carrying on of their operations. The rate, however, is not higher than the planters in the neighboring British colony of British Guiana are accustomed to pay. In the budget for 1863 provision was made for the extraordinary expenses connected with the emancipation to the amount of £1,065,366, of which £867,000 as compensation for the slaves of Surinam, and £21,250 as premiums for free labor. For Curaçoa and its dependencies, £166,090 of compensation money, fully £12,000 being for various other outlays connected with the change. The number of slaves set free may be stated in round numbers to be 42,000, of whom 35,000 are in Dutch Guiana.

On July 16, 1863, a treaty was signed at Brussels by all the naval powers for the buying up of the toll levied, under treaty arrangements, by the king of the Netherlands, on vessels navigating the Schelde (q.v.), the king of Belgium binding himself also to reduce the harbor, pilot, and other charges on shipping within that kingdom.

The Netherlands have suffered much from floods, either caused by the breaking in of the sea, or by the descent of masses of water from Germany, while the rivers of the Rhine delta were blocked up with ice. The Zuyder Zee (q.v.), which contains 1365 sq.m., was of trifling extent till the flood of All Saints' day, 1247, when the North sea swallowed up a large tract of country. In 1277 the Dollart gulf, in Groningen, was formed at the mouth of the Ems, by floods in the spring and autumn of that year, which destroyed 33 villages and 100,000 people. The immense waste of waters known as the sunken South Holland Waarde, or Biesbosch, arose out of the breaking of one of the dykes, 1421, by which 72 villages were laid under water, only 34 of them reappearing. In modern times great floods, but fortunately with only temporary results, have occurred in 1809, 1825, and 1855. That of 1855, which placed the town of Veenendaal, in Gelderland, and an extensive tract of country under water, was caused by a rapid thaw in the high lands of Germany pouring down torrents of water into the Netherlands while the rivers were ice-locked after a winter of unusual severity.—See the *Allgemeene Statistiek van Nederland; Nederland-Geographisch-Historisch Overzigt*, by Luit. L. G. Beausar; *Statistiek Jaarboek* (Witkamp, Amsterdam), an excellent book of reference, which is published yearly up to the present time; the provincial annual reports, etc.

NETHERLANDS (*ante*). See Dutch Language and Literature.

NETHERLANDS TRADING COMPANY, a chartered joint-stock association, with limited liability, formed to aid in developing the natural resources of the Dutch East Indian possessions. The company possesses peculiar privileges, acting exclusively as the commission-agents of the Netherlands government in importing and selling the produce of the colonies, as well as doing a large business as merchants. Private enterprise having failed to develop the trade of Java, after that island was restored to the Netherlands, King William I., in 1824, erected the trading company, with a capital of upwards of 3 millions sterling, not only becoming a large shareholder, but guaranteeing an interest of 1 per cent on the paid-up capital. The early transactions were unprofitable, and in 1827 the king had to pay a part, and in 1830 the whole of the guaranteed interest. From that date, it has prospered and handed over, from the trade of Java (q.v.), large surplus balances into the national revenue. The head office of the directors is at Amsterdam, with agents at Rotterdam, Middleburg, Dordrecht, and Schiedam; the principal factory at Batavia, with agencies at the chief ports in Java and the other Netherlands possessions in the Eastern Archipelago. Formerly the company sent large quantities of goods to the colonial markets for the account of the Dutch government; but since the beginning of 1875, the business for the government has been confined to colonial produce, which is placed in factories, forwarded to Holland, and disposed of at the company's sales in Amsterdam, Rotterdam, etc. In 1875, they sold for the government 756,959 bales of coffee, which realized £4,378,292; 136,768 blocks of banca and 2,956 of Billiton tin, at £376,548; 432 packages of cinchona bark and powder at £5,977. On the company's account, colonial produce was sold to the value of £761,267; and calicoes, yarns, woolen stuffs, various goods, precious stones, and money to the value of £214,688, were sent to Netherlands-India, Singapore, British India, China, Japan, and Surinam. The company also advance money to planters and manufacturers in the colonies, who bind themselves for a number of years to consign their produce. They are also owners of a large sugar plantation, Resolutie, in Surinam. The present capital is 36,140,000 guilders, or £3,011,666. The commission paid by government is a chief source of profit. For 1875, the net gain was £180,354, from which the shareholders received $5\frac{4}{5}$ per cent. The result would have been more favorable had not heavy loss been sustained in the Japan trade.

The success of the trading company depends mainly on the culture system, which was introduced into Java in 1830. Under the native rule, the land belonged to the princes, and the cultivators paid one-fifth of the produce, and one-fifth of their labor as ground-rent. The Dutch, by conquest, are now the proprietors of the greater part of the island, and exact the old produce rent, relaxing the labor to one-seventh, and causing the holders of crown-lands to plant one-fifth of their cultivated fields with the crop best adapted for the soil and required for the European market. The government also has supplied, free of interest, enterprising young men with the capital necessary to erect and carry on works for the preparation of the raw materials, to be repaid in ten yearly instalments, beginning with the third year. The land-holders of a certain district allotted to a sugar-mill were bound to supply a fixed quantity, receiving advances upon the crop to enable them to bring it forward. The rule of fixed quantity was relaxed in 1860, and has caused great discontentment among the contractors. The European residents and their assistants, the native princes, chiefs, and village head-men, receive a percentage according to the quantity which is manufactured from the produce delivered, so that all are interested in taking care that the lands are cultivated and the crops cared for. Sugar, tobacco, and tea are prepared by contractors; indigo, cochineal, coffee, cinnamon and pepper, by the natives under European surveillance, all passing into the trading company's factories for shipment to the Netherlands. The objections to the system are, that it does not leave the labor of the natives free, and that the passing of so much of the export and import trade through one favored company injures the general merchant. On the other hand, it must be said that the Dutch government only carries out the old law, and it is therefore not regarded by the peasantry as an infringement of their rights; and the merchants and capitalists of the Netherlands did not of themselves put forth sufficient efforts to work out the natural capabilities of Java when it returned under Dutch rule.

NETLEY, Royal Victoria Hospital at, is a superb building, on the shore of Southampton water, for the reception of invalids from the army on foreign service, and from among the troops serving in the adjoining military districts. In times of peace, it is only necessary to use a portion of the vast structure; but in the event of a European war, in which the British army should take part, the exigencies of the service would probably tax its accommodation to the utmost. There is provision for 1,000 patients, with power to increase the number if necessary. The medical staff of course varies in proportion to the work to be done; but at present it consists of a governor, an adjutant, a pay-master, an assistant-commandant, and medical officers, and officers of orderlies of various ranks. The total cost of the construction of this hospital, which was commenced in 1855, has been about £350,000. Attached is the medical school for candidates for the army medical department, the students having the best means of practical instruction in the wards of the hospital. Netley is also the headquarters of the female nurses of the army, who are under the control of a lady stationed here as superintendent. Complete arrangements have been made for the landing of wounded men in front of the hospital, and for conveying them thither with the least disturbance. There is no doubt as to the

convenience of this great hospital for its purposes; but some questions have been raised, under high sanitary authority, as to the salubrity of the site, adjacent as it is to the wide banks of mud which Southampton water uncovers at low tide.

NETS are fabrics in which the threads cross each other at right angles, leaving a comparatively large open space between them; threads are also knotted at the intersections. In this respect netting differs essentially from weaving, where the intersecting threads simply cross each other. The open spaces in nets are called *meshes*, and these correspond in size with an instrument used in net-making, consisting of a flat piece of wood or other hard substance, usually about the shape and size of a common paper-knife. In addition to this, a peculiar kind of needle is used, upon which a large quantity of the thread is placed by winding it from end to end between the forked extremities; the holes are used to insert the end of the thread, to prevent it slipping off at the commencement of the winding. The art of net-making has been practiced from the earliest times by the most savage as well as the most civilized nations. Even where the art of weaving was quite unknown, as in some of the South Sea islands when first discovered, that of netting was well understood; and it is easy to see that the human race could not help learning the value of this art from seeing how frequently land and water animals get entangled in the shrubs and weeds through which they attempt to pass; hence we find amongst savage tribes, almost universally, nets are used not only for fishing, as with us, but also for entrapping land animals. We have ample illustrations of the uses of nets for both purposes in the bas-reliefs of Assyria, Greece, and Rome, and in the mural paintings of Egypt.

Until recently nets have been always made by hand, and generally the thread has been a more or less thick twine of hemp or flax, the thickness of the twine and the size of the mesh depending upon the kind of fish for which it was made; recently, however, great improvements have been made in the manufacture of nets, and machinery of a most beautiful automatic kind has been introduced by Messrs. Stuart of Musselburg, whose manufactory is of vast extent. This establishment commences with the raw materials, which are hemp, flax, and cotton, the last having been extensively employed for herring and sprat nets of late years. Hemp, however, is the chief material for net-making; and in order to prepare it, it is first passed in long rolls through a machine consisting of two rollers with blunt ridges, the upper of which is kept down on the material by means of a hanging weight, consisting of a loaded box suspended to a chain from the axle of the roller. After the fiber has passed through this, it is much more supple than before, and is then *hackled;* this process is also done by machinery, which was first introduced into this manufactory for hemp-hackling, and succeeds admirably. It subsequently passes through the carding, roving, and spinning processes, as in all other kinds of yarn, and is finally twisted into threads or twines of the required thickness. Messrs. Stuart have in one room 4,000 spindles at work, besides the carding and twist machines. Of their patent loom they have 200 at work, the largest of which makes nets 480 meshes in width. It would be useless to attempt to describe these ingenious looms, which are worked by hand, otherwise than by saying that their leading features are like the stocking-frames; a series of sinkers push forward, pull down, and pass in and out the thread, which is carried from one side of the web to the other by long iron needles, which act as shuttles passing not over-quickly from a long box on each side of the loom. The bobbins of twine which feeds the needle must have a conical form, which is most ingeniously given it by a special contrivance, in the twisting-machine; twine passes through small rings to prevent it being given off too quickly, or in knots or kinks. This simple yet most effective contrivances is worked by wheels and jointed rods, and might be advantageously applied to many other purposes. After the net comes from the loom, it goes to the finishers, who, by hand, make the addition of a kind of selvage, consisting of several thicknesses of twine, to give strength to the edges. The nets are then ready for use, and are sent in vast numbers to all parts of the world. Machine net-making is now becoming general.

A great variety of nets are in use amongst fishermen, but the principal are the *seine*, *trawl*, and *drift nets*. The seine is a very long but not very wide net, one side of which is loaded with pieces of lead, and consequently sinks; the other, or upper, is buoyed with pieces of cork, and consequently is kept up to the surface. Seines are sometimes as much as 190 fathoms in length. When stretched out they constitute walls of net-work in the water, and are made to inclose vast shoals of fish. The trawl is dragged along the bottom by the fishing-boat; and the drift-net is like the seine, but is not loaded with lead; it is usually employed for mackerel fishing.

Various kinds of nets are used in bird-catching, one of which is noticed in the article CLAP-NET. Nets are used in catching quadrupeds, chiefly for the purpose of inclosing spaces within which they are, but sometimes also for throwing upon them to confuse and entangle them.

Nets are used by gardeners to protect crops from birds; also to protect the blossoms of trees from frost, and it is wonderful how well this object is accomplished, even when the meshes are pretty wide, and the son's rays have very free access.

NETSCHER, GASPAR, or KASPAR, 1639–84; b. Germany; adopted by the physician Tulckens, who placed him under the instruction of Koster, a painter of poultry and

objects of still life. He afterwards studied under Gerard Terburg at Deventer. He set out for Italy, where he intended to complete his studies, but having married at Bordeaux, he returned to Holland, and established himself at the Hague. He now took up portrait painting, having previously painted only small cabinet pieces. His best works are his musical and conversational pieces. He was a brilliant colorist, a master of light and shade, and very skillful in his treatment of accessories and draperies. Many of his pictures are in Louvre, at Dresden, Munich, or Florence. His eldest son, THEODOR, 1661–1732, b. Bordeaux, was for many years a portrait painter in Paris, imitating his father's style, but inferior to him. He went to London in 1715, as paymaster of the forces, and being introduced at court, painted many of the principal persons in England, where he remained for six years. Kaspar's second son, CONSTANTINE, 1670–1732, was also a painter of some reputation, who followed closely the manner of his father.

NETSUKÉ, from the Japanese *ne* (wood or root) and *tsuké* (to suspend), a button of wood, crystal, or porcelain, but usually of ivory, by which the Japanese smoker suspends his outfit of tobacco, flint and steel, pipe, etc., from his girdle. Generally the netsuké is an elaborate work of art in carving, and is among the most characteristic products of native skill, portraying the fun, humor, grotesque or pathetic traits in human and animal nature, and illustrating the national legendary and historic lore. The best specimens have engraved on them the mark of the carver, and are very costly.

NETTING, NAVAL. A *boarding-netting* is formed of strong rope, and stretched above the bulwarks of a ship, over the port-holes, etc., to a considerable height, for the purpose of preventing the entrance of boarders from hostile boats. In positions where boat attacks are feasible, ships are thus protected at night, and at other times when attempts at boarding are anticipated.

The *hammock-netting* is in the bulwarks of a ship, usually in the waist, and its purpose is to keep the hammocks of the crew when stowed there during the day; thus netted together, the hammocks form a valuable barrier against bullets.

Hatchway-nettings are of inch rope, and are placed over the open hatchway during fine weather, to prevent persons from falling through.

NETTLE, *Urtica*, a genus of plants of the natural order *Urticeæ*, having unisexual flowers, the male and female on the same or separate plants; the male flowers with a 4–parted perianth, and four stamens; the female flowers with a 2–parted perianth and a tufted stigma; the fruit an achenium. The species are herbaceous plants, shrubs, or even trees, many of them covered with stinging hairs, which pierce the skin when touched, and emit an acrid juice, often causing much inflammation and pain. When a nettle is grasped in such away as to press the hairs to the stem, no stinging ensues; but the slighest inadvertant touch of some of the species produces very severe pain. The stinging of the native nettles of Europe is trifling in comparison with that of some East Indian species. *U. crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about twenty-four hours and then abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is *U. urentissima*, the *Devil's Leaf* of Timor. Of British species, the most venomous, but the most rare, is the ROMAN NETTLE (*U. pilulifera*); next to it is the SMALL NETTLE (*U. urens*), frequent about towns and villages, and in waste and cultivated ground; whilst the least venomous is the most common and only perennial species, the GREAT NETTLE (*U. dioica*), everywhere abundant, but particularly near human habitations, or their former sites, the desolation of which it may be said to proclaim. The roots of nettles, boiled with alum, afford a yellow dye; and the juice of the stalks and leaves has been used to dye woolen stuffs of a beautiful and permanent green. The young shoots of *U. dioica* are used in some parts of Scotland and other countries as greens, and their peculiar flavor is much relished by some, although, in general, the use of them is confined to the poor; which, however, is probably the result of mere prejudice. Whatever it is that gives nettles their stinging power, is dissipated by boiling. The high value of nettles as food for swine, is well known to the peasantry of many countries; the great Nettle is cultivated in Sweden for fodder of domestic animals; nettles are also highly esteemed as food for poultry, particularly for turkeys. The seeds are extremely nutritious to poultry; and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves of nettles are employed in some parts of England, for the manufacture of a light kind of beer, called *Nettle beer*, which may be seen advertised at stalls, and in humble shops in Manchester and other towns. The *bast* fiber of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fiber of *U. dioica* was used by the ancient Egyptians, and is still used in Piedmont and other countries. When wanted for fiber, the plant is cut in the middle of summer, and treated like hemp. The names *Nettle Yarn* and *Nettle Cloth* are, however, now commonly given in most parts of Europe to particular linen and cotton fabrics.—The fiber of *U. cannabina*, a native of the south of Siberia and other middle parts of Asia, is much used; and from

that of *U. Whitlawi*, both fine lace and strong ropes can be manufactured. The fiber of *U. Japonica* is much used in Japan, and that of *U. argentea* in the South Sea islands; that of *U. Canadensis* is used in Canada.—The seeds and herbage of *U. membranacea* are used in Egypt as emmenagogue and aphrodisiac; and somewhat similar properties are ascribed to *U. dioica.*—*U. tuberosa* produces tubers, which are nutritious, and are eaten in India, raw, boiled, or roasted.—Australia produces a magnificent tree-nettle, *U. gigas*, abundant in some parts of New South Wales, ordinarily from 25 to 50 ft. high, but sometimes 120 or 140 ft., with trunk of great thickness, and very large green leaves, which, when young, sting violently. In some places, it forms *scrub* forests, and its stinging leaves form a great impediment to the traveler.

NETTLE-RASH, or URTICA'RIA (Lat. *urtica*, a nettle), is the term applied to a common form of eruption on the skin. The eruption consists of wheals, or little solid eminences of irregular outline, and either white or red, or most commonly both red and white, there being a white center with a red margin. The rash is accompanied with great heat, itching, and irritation; the appearance on the skin and the sensation being very much like the appearance and feeling produced by the stinging of nettles; and hence the origin of its names.

The disease may be either acute or chronic. In the acute form, feverishness usually precedes the rash by a few hours, although sometimes they commence together. The disorder is always connected with some derangement of the digestive organs, and it may often be traced to the imperfect digestion of special articles of food, such as oatmeal, the kernels of fruit, strawberries, cucumbers, mushroons, and especially oysters mussels, and crabs, which are eaten with perfect impunity by most persons. An hour or two after the offending substance has been swallowed, there is a feeling of nausea, with oppression about the pit of the stomach; the patient often complains of giddiness, and the face frequently swells; the skin then begins to tingle, and the eruption breaks forth; vomiting and diarrhea often supervene, and act as a natural cure; but even when they do not occur, the violence of the rash usually subsides in a few hours, and the disorder altogether disappears in a day or two.

The chronic form is often very troublesome; and frequently comes on periodically in the evening. Cases are reported in which persons have been afflicted for ten years continuously by this form of the disease. Patients have left off all their customary articles of diet, one by one, without in all cases meeting with relief; and hence it may be inferred, that although the disease depends in all cases on a disordered condition of the digestive organs, it is not always the consequence of some special offending article having been swallowed.

The main treatment of the acute form consists in expelling the offending matter by an emetic and by purgatives, and the cure is thus usually completed. In the chronic form, the patient should, in the first place, determine whether the rash is caused by any particular article of diet, and if this seems not to be the case, an attempt must be made to improve the state of the digestive organs. A few grains of rhubarb taken daily, just before breakfast and before dinner, will sometimes effect a cure. If this simple remedy fails, Dr. Watson recommends the trial of a draught composed of the infusion of serpentaria (about an ounce and a half), with a scruple each of the carbonates of magnesia and soda. He adds, that although external applications are usually of little avail, he has found that dusting the itching surface with flour sometimes affords temporary relief; and that a still more useful application is a lotion composed of a dram of the carbonate of ammonia, a dram of the acetate of lead, half an ounce of laudanum, and eight ounces of rose-water.

NETTLETON, ASAHEL, D.D., 1783–1844; b. Conn.; graduated at Yale college in 1809; studied theology at New Haven; was licensed to preach in 1811 by the West Congregational association of New Haven; ordained as an evangelist in 1817 by the South consociation of Litchfield county. He commenced study with the view of being a missionary, but his services being in great demand, and his preaching very successful, he was led to consider it his duty to remain at home. For several years he preached in some of the largest and most important towns in Connecticut with great effect. In 1822 he had an attack of typhus fever, from the effects of which he never entirely recovered. In 1827 he visited Virginia for his health, and on his return in 1829, preached for two years in New York and New England. In 1831 he visited England, preaching there, and in Scotland and Ireland. After his return he was appointed in 1832 professor of pastoral theology in East Windsor theological seminary. He declined the professorship, but resided in the place, and lectured for several years to the students. His sermons were extemporaneous and generally doctrinal and argumentative, but with fervent appeals to the conscience. His style and manner were deeply solemn, to which impression his various methods in the conduct of his meetings contributed. He was a decided opponent of Dr. Taylor's (New Haven) theological views. He published a small hymn-book, entitled *Village Hymns*, which was very popular and widely used. His *Remains and Sermons* were edited by Dr. B. Tyler, who published also a *Memoir*, which was republished in Edinburgh, and revised by Dr. A. A. Bonar.

NETTLE-TREE, *Celtis*, a genus of deciduous trees of the natural order *ulmaceæ*, with simple and generally serrated leaves, considerably resembling those of the common net-

tle, but not stinging. The genus is distinguished chiefly by its fruit, which is a fleshy, globose, or sub-globose 1-celled drupe. The common or European nettle-tree (*C. Australis*) is a native of the s. of Europe, the w. of Asia, and the n. of Africa. It grows to the height of 30 to 40 ft., and is a very handsome tree, often planted along public walks in the s. of France and n. of Italy. The wood is very compact, very durable, and takes a high polish. It was formerly much imported into Britain for the use of coachmakers. It is used in Italy by musical instrument makers for flutes and pipes. The flowers are inconspicuous, axillary, and solitary; the fruit black, resembling a small wild cherry, not eatable till after the first frosts, and then very sweet. The kernel yields a useful fixed oil. The tree succeeds well in the s. of England.—*C. occidentalis* is a native of North America from Canada to Carolina, sometimes there called the nettle-tree, sometimes the SUGAR BERRY. Its leaves are much broader than those of *C. Australis*, its fruit very similar. It is a much larger tree, attaining a height of 60 to 80 feet.—Another American species, *C. crassifolia*, often called HACKBERRY or HAGBERRY, and HOOP ASH, is very abundant in the basin of the Ohio and westward of the Mississippi. It grows to a great height, but the trunk is not very thick. The wood is not much valued, but is said to make very fine charcoal. The fruit is black, and about the size of a pea.—The inner bark of *C. orientalis*, consisting of reticulated fibers, forms a kind of natural cloth, used by some tribes of India.—A number of other species are natives of the warm parts of America and of Asia.

NEU-BRAN'DENBURG, a t. of Mecklenburg-Strelitz, the prettiest, and after the capital, the largest in the duchy, is situated on lake Tollens, 17 m. n.n.e. of Neu-Strelitz. It is regularly built, contains two churches, a castle, etc., is the center of a picturesque district, and the seat of considerable industry. Pop. '80, 8,406.—About half a league from Neu-Brandenburg, on a rock overlooking lake Tollens, stands the ducal pleasure-castle of Belvedere, commanding, it is said, the most beautiful prospect in Mecklenburg.

NEU'BURG, an ancient t. of Bavaria, is picturesquely situated on the right bank of the Danube, 29 m. n.n.e. of Augsburg. It contains a handsome palace, the château of the dukes of Bavaria of the line of Pfalz-Neuburg, who resided here from 1596 to 1742. The palace contains a collection of ancient armor. Brewing and distilling are carried on, and there is a considerable commercial trade on the Danube. Pop. '80, 7,690.

NEU-CHWANG, or YING-TSZE, a t. of the Chinese empire, in Manchuria. It stands on the left bank of the river Liaou, about 25 m. from its mouth, and in lat. 41° n., and long. 122° 30′ east. The Liaou, which falls into the gulf of Liaou-tong, at the head of the Yellow sea, is navigable for sea-going vessels to Neu-Chwang; and Neu-Chwang is therefore regarded as a seaport, and is one of those opened to foreign trade by the treaty of Tientsin. A British consul resides here; but the trade is as yet inconsiderable, and only to Chinese ports.

NEUFCHATEL', or NEUCHATEL, known also as *Neuenburg*, a canton in the w. of Switzerland, between lake Neufchatel and the French frontier. Area, 310 sq. miles. Pop. '70, 97,284; '80, about 103,850. Above 17,000 families speak French, and 2,700 German. Neufchatel lies in the midst of the Jura mountains, four chains of which, running from n.e. to s.w., traverse the canton, and are separated by elevated longitudinal valleys. The most easterly of these is a broken chain, running parallel to the lake of Neufchatel, on whose banks, and on the second and lower ranges beyond it, the vine is carefully cultivated. This second chain has five principal passes, the highest of which, La Tourne, has an elevation of about 4,000 feet. The third and fourth ranges, abutting on France, consist for the most part of barren hills, separated by elevated valleys; but here and there these high lands are well wooded and fruitful, producing corn, good pasture, fruits, etc. The greater number of the numerous streams which water the canton flow into the Rhine. Among these mountain torrents the principal are the Reuse, the Seyon, and the Serriere, the two former of which, together with the rivers Orbe and Broie, are the feeders of the lake of Neufchatel, known also as the lake of Yverdun. The Thiele serves as its outlet, and carries its waters into the neighboring lake of Bienne, and into the river Aar. The lake is 25 m. long and from 3 to 5½ m. wide. Its level above the sea is 1420 ft., and it has a depth of 400 or 500 feet.

The natural products are iron ores, coal, asphalt, fruit, including grapes—from which good red and white wines are made—timber and corn, although the latter is not grown in sufficient quantity for the demands of the home consumption. The rearing of cattle constitutes an important branch of industry, and large quantities of cheese are exported; but the specialty of the canton is watch-making, which occupies from 18,000 to 20,000 persons, and is prosecuted in detail at the homes of the work-people, in the rural districts, where some families manufacture only special parts of the machinery, while others are engaged solely in putting together the separate portions that have been manufactured by others; and the watches thus prepared are exported in large quantities to every part of Europe and America. Muslin-printing employs upwards of 10,000 persons, and lace is extensively made by the country-women of the Val de Travers.

The climate of Neufchatel varies greatly with the locality; being temperate on the shores of the lake, cooler in the valleys, and severe on the mountain-sides. The population, with the exception of between 9,000 and 10,000 Catholics, belongs to various Protestant denominations.

The history of Neufchatel was identical with that of Burgundy till the 11th c.; and after the principality had been for a time incorporated with the territories of the counts of Chalons, to whom it had been granted in 1288 by Rudolph of Hapsburg, it passed to the house of Longueville. In 1707, on the extinction of the Neufchatel branch of the latter family, 15 claimants came forward to advance more or less valid pretensions to the Neufchatel territory. Frederick I. of Prussia, who based his claim to the principality of Neufchatel on the ground of his descent from the first prince of Orange, a descendant of the house of Chalons, was the successful candidate; and from his time it continued associated with Prussia till 1806, when Napoleon bestowed it upon gen. Berthier; but in 1814 it was restored to the house of Brandenburg. This connection with the Prussian monarchy has been wholly dissolved since 1857, and Neufchatel is now a member of the Swiss confederation.

NEUFCHATEL, or NEU'ENBURG, is the chief t. of the canton, and occupies a magnificent site on the n.w. shore of the lake of Neufchatel, and is noted for its many charitable institutions, and for the beauty of its charmingly situated environs. Pop. '80, 15,612.

NEU'HAUS, a t. of Bohemia, on the Nescharka, about 70 m. s.s.e. of Prague. Its palace, belonging to count Czerny, is a splendid edifice. Cloth, paper, and chemical products are manufactured. Pop. '80, 8,703.

NEU'HAUSEL (Hung. *Ersek-Ujvár*), a t. of Hungary, on the right bank of the Neutra, 74 m. n.w. of Pesth, by the Vienna and Pesth railway. It was formerly strongly fortified, and played an important part in the Turkish wars. No traces of its fortifications now remain. Pop.'80, 10,584, chiefly engaged in agriculture and the rearing of cattle.

NEUHOF, THEODOR VON, Baron, 1686–1756; b. in Metz, Westphalia; became a lieut. in an Alsace regiment, but soon left on account of his poverty, indebtedness, and, it is said, a duel. From this time he wandered about Europe, making use of his title and address to contract new debts. In Spain he met with some success, was offered a colonel's commission, and was engaged to marry one of the queen's ladies of honor. Finding that her dowry was less than represented, he fled with her jewels. In 1735 he became interested in the Corsican movement to assert the independence of Genoa, and in the following year persuaded the dey of Tunis to intrust to his command two regiments, with supplies and ammunition. Landing in Corsica in March, he was received with enthusiasm. Exaggerated and totally false ideas as to his rank in nobility and his influence with the governments of Europe were promulgated, and in April he was elected king under the title of Theodore I. His reign lasted but eight months, during which time he made great display personally and formed a new order of knighthood. His promises of foreign assistance were not realized, though the Netherlands made some vague treaty of alliance; and when in 1738 the French came to the aid of the Genoese, the Corsican cause was lost and Neuhof fled. After the departure of the French, 1741–42, Neuhof found that his popularity had vanished and that his life was in danger. He fled again to England, where he was imprisoned for debt by his Dutch creditors (he had in 1738 mortgaged two Corsican cities for funds to carry on the war), and was released in 1756, a few months before his death, by the assistance and intercession of Horace Walpole.

NEUILLY (sometimes called NEUILLY-SUR-SEINE, to distinguish it from several much less important places of the same name), a t. of France, in the department of Seine, on the right bank of the river Seine, immediately to the n. of the Bois de Boulogne. Neuilly may now be regarded as a suburb of Paris, with which it is connected by several streets, or roads, lined with numerous villas. Here, near the Seine, and in a large and beautiful park, formerly stood the château de Neuilly, built by Louis XV., and the favorite residence of Louis Philippe, which was burned at the revolution in 1848. The park was also then divided into lots for sale, the consequence being a rapid increase of the number of houses in Neuilly. Neuilly has manufactures of porcelain and starch, chemical works, and distilleries. Pop. '72, 15,466. When Louis Philippe abdicated, and took refuge in England, he assumed the title of count de Neuilly.

NEUKOMM, SIGISMUND, 1778–1858; b. Germany; studied under Michael and Joseph Haydn, and in 1804 became leader of the German opera. In 1816 he went to Rio Janeiro, and was appointed music teacher to the court. He returned in 1821, and lived at Talleyrand's house in Paris. He composed many cantatas, symphonies, sonatas, etc., and two successful oratorios, *Mount Sinai*, 1831; and *David*, 1834.

NEUMANN, KARL FRIEDRICH, 1798–1870; b. in Bavaria; educated at the universities of Heidelberg, Munich, and Göttingen; afterwards studied in Paris and Vienna. Of Jewish birth, he became converted to Christianity and joined the Lutheran sect. In 1829 he traveled in China and India, making a very large collection of books in the native languages. From 1831 to 1852 he was professor of oriental languages at the university of Munich; but his political views caused his dismissal. It was after this that he wrote his *Geschichte der Vereinigten Staaten von Amerika*, and *Hocin Schein*, an account of the alleged discovery of America by Buddhist monks. He also published very many pamphlets and papers relating for the most part to oriental languages and literature, especially those of the Armenians.

NEU'MUNSTER, a prosperous manufacturing and market town of Holstein, on the Schwale, one of the head-waters of the Stoer, and on the railway between Altona and

Kiel, 19 m. s. by w. from Kiel. There are large woolen and linen factories, tanneries, dye-works, and breweries. Pop. '80, 11,623.

NEURAL'GIA (Gr. *neuron*, a nerve; *algos*, pain) is a term employed to designate pain of a purely nervous character, usually unaccompanied by inflammation, fever, or any appreciable change of structure. The pain, which occurs in paroxysms, usually followed by complete remissions, is of every possible degree and character, being described in different cases as piercing, tearing, burning, etc. These paroxysms may occur at intervals of a few seconds only, or they may take place daily or on alternate days, or they may be separated by much longer intervals, which are often, but by no means always, of a regular length. With the pain there is frequently spasmodic twitching of the adjacent muscles. The duration of the disease is very uncertain. The patient may have only a single attack, or he may be liable to recurring attacks for months, years, or even for his whole life; it is, however, very seldom that the disease occurs but once. Death scarcely ever results directly from this affection, but the pain may, by its severity and persistence, gradually undermine the constitution.

The disease may attact any part of the body where there are nerves; but in no part does it occur so frequently as in the face, when it is popularly known as *tic-douloureux;* its seat being in the facial branches of the fifth pair of nerves (the trifacial nerves). The following graphic description of the ordinary varieties of this form of neuralgia is borrowed from Dr. Watson's *Lectures on the Principles and Practice of Physic:* "When the uppermost branch of the trifacial nerve is the seat of the complaint the pain generally shoots from the spot where the nerve issues through the supercilliary hole; and it involves the parts adjacent, upon which the fibrils of the nerve are distributed—the forehead, the brow, the upper lid, sometimes the eyeball itself. The eye is usually closed during the paroxysm, and the skin of the forehead on that side corrugated. The neighboring arteries throb, and a copious gush of tears takes place. In some instances the eye becomes blood-shotten at each attack; and when the atttacks are frequently repeated, this injection of the conjunctiva may become permanent.

"When the pain depends upon a morbid condition or morbid action of the middle branch of the nerve it is sometimes quite sudden in its accession, and sometimes comes on rather more gradually; being preceded by a tickling or pricking sensation of the cheek, and by twitches of the lower eyelid. These symptoms are shortly followed by pain at the infra-orbitary foramen, spreading in severe flashes (so to speak) over the cheek, affecting the lower eyelid, ala nasi, and upper lip, and often terminating abruptly at the mesial line of the face. Sometimes it extends to the teeth, the antrum, the hard and soft palate, and even to the base of the tongue, and induces spasmodic contractions of the neighboring muscles.

"When the pain is referrible to the inferior or maxillary branch of the fifth pair of nerves it darts from the mental foramen, radiating to the lips, the alveolar processes, the teeth, the chin, and to the side of the tongue. It often stops exactly at the symphysis of the chin. Frequently it extends in the other direction, to the whole cheek and to the ear. During the paroxysm the features are liable to be distorted by spasmodic action of the muscles of the jaw, amounting sometimes to tetanic rigidity, and holding the jaw fixed and immovable.

"The paroxysms of suffering in this frightful disease are apt to be brought on by apparently trival causes—by a slight touch, by a current of air blowing upon the face, by a sudden jar or shake of the bed on which the patient is lying, by a knock at the door, or even by directing the patient's attention to his malady by speaking of it or asking him questions about it. The necessary movements of the face in speaking or eating are often sufficient to provoke or renew the paroxysm. At the same time, firm pressure made upon the painful part frequently gives relief, and causes a sense of numbness to take the place of the previous agony" (vol. i. pp. 723–24).

Tic-douloureux in the form of severe neuralgia which is by far the most commonly met with; the reason probably being that the trifacial nerve lying superficially, and being distributed over a part of the surface which is usually unprotected by any artificial covering, is very liable, for that reason, to be affected by exposure to atmospheric influences, which are undoubtedly to be included among the exciting causes of this disease. Amongst other seats of neuralgia may be mentioned the arm, especially the fore-arm, the spaces between the ribs, especially between the sixth and ninth, and the lower extremity, where it most frequently affects the sciatic nerve, giving rise to the affection known as SCIATICA, which, however, not always being pure neuralgia, will be noticed in a separate article.

The causes of neuralgia are various. Excluding inflammation of the nervous trunk or *neuritis*, the pain may be excited by a tumor pressing on the nerve, or originating in its substance; or by roughness of a bony surface with which the nerve may be in contact, as when it passes through a foramen; or it may be due to tumors within the cranium, or a morbid state of the spinal cord. Sometimes, again, irritation applied to *one* branch of a nerve will give rise to pain at the extremity of *another* branch of the same nerve, the sensation being reflected along the branch which is not directly exposed to the irritation. In this way we may explain the pain in the shoulder which often accompanies

disease of the liver; the pain in the thigh which is often associated with irritation of the kidney; the pain in the left arm which is often coincident with disease of the heart, etc. Persons suffering from debility, anæmia, and a gouty or rheumatic constitution, are so especially liable to neuralgia that these conditions—as also exposure to malarious influences—must be placed among the the predisposing causes. Amongst the exciting causes, exposure to cold and wet, or to a cold dry east wind, is the most frequent; but fatigue, strong mental emotions, the abuse of tea, coffee, tobacco, and alcholic drinks, a wound or bruise, the retrocession of gout, rheumatism, or cutaneous eruptions, etc.. occasionally suffice to excite the disease.

The resources of the materia medica have been exhausted in searching for remedies for this cruel disease. Dr. Elliotson believes that "in all cases of neuralgia, whether exquisite or not, unaccompanied by inflammation, or evident existing cause, iron is the best remedy;" and there can be no doubt that, when the disease is accompanied with debility and paleness, no remedy is likely to be so serviceable. If the digestive organs are out of order, the neuralgia may not unfrequently be removed or alleviated by correcting their unhealthy state. "Dr. Rigby tells us that having suffered in his own person an intense attack of tic-douloureux, which opium did not assuage, he swallowed some carbonate of soda dissolved in water. The effect was almost immediate; carbonic acid was eructed, and the pain quickly abated. In this case, the pain depended upon the mere presence of acid in the stomach. More often the cause of offense appears to lie in some part of the intestines; and purgatives do good. Sir Charles Bell achieved the cure of a patient upon whom much previous treatment had been expended in vain, by some pills composed of cathartic extract, croton oil, and galbanum. He mixed one or two drops of the croton oil with a dram of the compound extract of colocynth; and gave five grains of this mass, with 10 grains of the compound galbanum pill, at bedtime. Other cases have been since reported, both by sir Charles and by others, in which the same prescription was followed by the same success."—Watson, *op. cit.* p. 727.

When the disease occurs in a rheumatic person, iodide of potassium (from three to five grains taken in solution three times a day before meals) sometimes gives great relief. When the paroxysms occur periodically—as, for example, with an interval of 24 or 48 hours—sulphate of quinine in doses of from 10 to 20 grains between the paroxysms, will usually effect a cure; and if the disease resist comparatively small doses, the quantity may be increased to half a dram, or a dram if necessary. Arsenic acts in the same manner as quinine in these cases, but usually less effectually.

The inhalation of chloroform will sometimes give permanent relief, and always gives temporary ease, and shortens the period of suffering.

The injection of a certain quantity of a solution of muriate of morphia, by means of a sharp-pointed syringe, into the cellular tissue beneath the skin over the painful spot, very often gives immediate relief. For the discovery of this mode of treating neuralgia, we are indebted to Dr. Alexander Wood of Edinburgh. At one time—about half a century ago—it was a common practice to divide the trunk of the painful nerve, with the object of cutting off the communication between the painful spot and the brain; but in many instances the operation signally failed, and it is now never resorted to. A much simpler operation, namely, the extraction of a canine tooth, has often been found to give permanent relief in cases of facial neuralgia, and in such case a careful examination of the teeth should usually be made.

Local applications can be of no permanent service in cases where the pain results from organic change, or from general constitutional causes; they will, however, often give considerable temporary relief. Amongst the most important local applications may be mentioned laudanum, tincture of aconite (or aconitina ointment, in the proportion of one or two grains to a dram of simple ointment or cerate), belladonna plaster, and chloroform (which should be applied upon a piece of linen saturated with it, and covered with oiled silk, to prevent evaporation).

Lastly, neuralgia being a purely nervous affection, is often influenced by means calculated to make a strong impression on the mind of the patient; and hence it is that galvanic rings, electric chains, mesmeric passes, homeopathic globules, and other applications, which, like these, act more upon the mind than upon the body of the patient, occasionally effect a cure.

NEURI'TIS is the term applied to inflammation of the nerves. The disease is rare' and not very well defined. The symptoms closely resemble those of neuralgia. Rheumatism seems, in most cases, to be the cause of the disease, which must be treated by bleeding, leeching, purging, and low diet. Anodynes are also required for the relief of the pain; and of these, Dover's powder, in tolerably full doses, is perhaps the best.

NEUROP'TERA (Gr. nerve-winged), an order of mandibulate insects, having four nearly equal and membranous wings, all adapted for flight, divided by their nervures into a delicate net-work of little spaces, and not covered with fine scales, as in the *lepidoptera*. The wings are often extended horizontally when at rest, nearly as in flight; but the position is various. The form of the wing is generally somewhat elongated. The body is generally much elongated, particularly the abdomen. The head is often large, the compound eyes very large, and there are often also simple or stemmatic eyes. The habits are predaceous, at least in the larva state; often also in the pupa and perfect

states, the food consisting of other insects, often caught on the wing. The power of flight is accordingly great in many. The larvæ and pupæ are often aquatic. The females have no sting, and only a few have an ovipositor. The metamorphosis is complete in some, incomplete in others. Dragon flies, May flies, scorpion flies, ant-lions, and termites, or white ants, belong to this order.

NEUROT'ICS (Fr. *névrotique;* Gr. *νεῦρον*, a nerve), a word recently come into use to specify such drugs as tend to affect principally and specifically the nerves of thought and motion. Alcohol, ether, chloral, opium, potassium, bromide, amyl-nitrate, strychnine, quinine, aconite, and digitalis are examples of drugs to which this name may be applied.

NEU'SATZ (also *Neoplanta* or *Uj-Vidék*), a t. of the Austrian empire, in the Hungarian province of Bács, is situated on the left bank of the Danube, opposite Peterwardein. Its origin dates from the year 1700, and by the year 1849 it numbered nearly 20,000 inhabitants. A bridge, 840 ft. in length, extends between Neusatz and the town and fortress of Peterwardein. Neusatz is the seat of the Greek non-united bishop of Bács. On June 11, 1849, it was taken from the Hungarian insurgents by the imperial troops, and was almost wholly destroyed. It has been rebuilt in excellent style. Neusatz is a station for steamers on the Danube, and carries on an important and active trade. Pop. '80, 21,381.

NEUSE, a river of North Carolina, rises near the middle of the northern boundary of the state, and, after a south-easterly course of 250 m., falls by a broad channel into Pamlico sound, which communicates by several inlets with the Atlantic ocean. It forms the harbor of New Berne.

NEU'SIEDL, Lake (Hung. *Ferto-tava*), a small lake on the n.w. frontier of Hungary, 22 m. s.e. of Vienna. It is 23 m. in length, and about 6 m. in average breadth, with a mean depth of 13 feet. Its waters are light-green in appearance, and are brackish in taste. The slopes of the Leitha mountains in the vicinity produce excellent wine.

NEU'SOHL (Hung. *Beszterce-Bánya*), a beautiful and thriving t. of Hungary, the chief place of the richest mining district in the country, is situated in a hill-inclosed valley on the right bank of the Gran, about 85 m. n. of Pesth. Neusohl, consisting, as it does, of the town proper and five suburbs, contains a population, in all, of (1880) 7,159, who are employed in the copper and iron mines of the vicinity, in the smelting-houses, and in the manufacture of beet-root sugar, paper, colors, etc. It is the seat of a bishop, and contains a beautiful cathedral, a bishop's palace, and two evangelical churches, and several other handsome edifices.

NEUSS, a fortress and flourishing manufacturing t. of Rhenish Prussia, near the left bank of the Rhine, with which it is connected by the river Erft, 4 m. s.w. of Düsseldorf. Its church of St. Quirinus, a beautiful edifice, and a noble specimen of the transition from the round to the pointed style, is supposed to have been built in 1209. Neuss is the principal grain-market of the province, and carries on manufactures of woolen and other cloths, ribbons, hats, vinegar, etc. It is supposed to be the *Novesium* of the Romans, sacked by Attila in the year 451. Pop. '80, 17,495.

NEU'STADT (Polish, *Prudnitz*), a t. of Prussian Silesia, 29 m. s.w. of Oppeln. It is the seat of considerable manufacturing industry, woolen and linen fabrics being the staple goods manufactured. Damask-weaving alone employs 660 hands, and 380 looms. Pop. '80, 14,292.

NEUSTADT, or Wiener-Neustadt, one of the most beautiful t. of lower Austria, called, from its loyalty, "the ever-faithful town" (*ewig getreue Stadt*), is situated 28 m. s. of Vienna, on the Vienna and Gloggnitz railway, and is also connected with the capital by a canal. It is surrounded by a broad and deep ditch, and by a fortified wall pierced by four gates. The town is overlooked by the large old castle of the dukes of Babenberg, now a military academy for the preparatory instruction of officers of the line. It accommodates from 400 to 500 pupils. The castle contains a fine Gothic chapel (date, 1460), rich in painted windows. It is the burial place of the emperor Maximilian I. On Sept. 14, 1834, the whole town, with the exception of 14 houses, was destroyed by a dreadful conflagration, which involved the loss of many lives. The new town has been laid out with great taste and regularity. The canal (40 m. in length) and the railway to Vienna, and the converging roads from Styria and Hungary, are the sources of the prosperity of the town. In Neustadt machinery is extensively constructed; and sugar-refining and manufactures of silk, velvet, and cotton fabrics, fayence, leather, etc., are carried on. Pop. '80, 23,735.

NEUSTADT AN DER HARDT, a small t. of Rhenish Bavaria, charmingly situated on the Speyerbach, at the foot of the Hardt mountains, 12 m. n. of Landau. Its church, with several curious monuments of the counts palatine, and with some ancient fresco-paintings, was finished in the 14th century. It carries on manufactures of paper, cloth, oil, brandy, etc. Pop. '80, 11,411.

NEUSTADT-E'BERSWALDE (since 1876 called officially *Eberswalde* only), a t. of Prussia, in the province of Brandenburg, 28 m. n.e. of Berlin. It is well known on account of

its mineral springs, and carries on extensive manufactures in steel, iron, copper, brass, paper, and porcelain. Pop. '80, 11,524.

NEU'STADTL AN DER WAAG, a t. near the n.w. frontier of Hungary, 33 m. n.n.w. of Neutra. Here excellent red wine is grown, and there is a good trade in grain, wool, sheep-skins, and wax. Pop. '80, 5,164, nearly half of whom are Jews.

NEUSTETTIN', a t. of Prussia in the province of Pomerania, 92 m. s.w. from Dantzic, on the southern shore of the Vilm See. It is the capital of a circle, and a place of some importance. Pop. '80, 8,604.

NEU-STREL'ITZ, the capital and the residence of the court of the grand duchy of Mecklenburg-Strelitz, pleasantly situated in a hilly district, between two lakes, 60 m. n.n.w. of Berlin. It was founded in 1733, is built in the form of an eight-rayed star, and contains the ducal palace, with a library of 70,000 vols., and having magnificent gardens attached. Pop. '80, 9,407, supported chiefly from the expenditure of the court, and by brewing and distilling. A mile s. of the town is Alt-Strelitz, with the largest horse-market in the duchy.

NEU'STRIA, or WEST FRANCE (*Francia occidentalis*), the name given in the times of the Merovingians and Carlovingians to the western portion of the Frank empire, after the quadruple division of it which took place in 511. Neustria contained three of these divisions. It extended originally from the mouth of the Scheldt to the Loire, and was bounded by Aquitania on the s., and by Burgundy and Austrasia (*Francia orientalis*), on the east. The principal cities were Soissons, Paris, Orleans, and Tours. Bretagne was always loosely attached to Neustria, of which the strength lay in the duchy of France. After the cession of the territory afterward called Normandy to the Normans in 912, the name Neustria soon fell into disuse.

NEUTERS, an Indian tribe, so named by the French from the neutrality observed by them in the wars between the Hurons and Iroquois tribes, between which they were situated. They lived on the banks of the Niagara. In 1649 the Neuters were conquered by the Iroquois, the larger part killed, and the rest incorporated in the Five nations. Early efforts to establish missions among them were not successful.

NEU'TITSCHEIN, a small manufacturing town of Moravia, on the Titsch, 80 m. n.e. of Brünn. It contains an old castle, and carries on manufactures of cloth and woolen-goods, dyeing, and wagon-making. Pop. '80, 10,264.

NEUTRA, a co. in n.w. Hungary, having Moravia for its n.w. boundary, and a range of the Carpathian mountains; 2,219 sq.m.; pop. '70, 361,005. It is drained by the Neutra, March, and Waag rivers, head-waters of the Danube. Its surface is hilly, and its pasturage excellent; and it exceeds all other localities of Hungary in the number of cattle and sheep raised. Its trade, carried on principally with the province of Moravia, is very active. Its manufactures are the products of the loom, linen, cotton, and woolen-goods. Its soil is adapted to vine-culture; and much wine is exported, *Neustadtler* being considered the most desirable. Capital, Neutra.

NEU'TRA, a t. of Hungary, the capital of a county of the same name, on a river of the same name, 72 m. n.n.w. from Pesth. Neutra is a very old town, having been the residence of a Moravian prince in the 9th c., before the Magyar invasion. Weaving is carried on to some extent; and Neutria, being not far from the Moravian frontier, has a considerable transit-trade. Pop. '80, 8,660.

NEU'TRAL AXIS, the name given to an imaginary line to any body which is being subjected to a transverse strain; and separating the forces of extension from those of compression. If the ratio of the resistances to extension and compression were the same for all substances, and depended merely on the form of the body, then in all bodies of the same form the neutral axis would have a definite geometrical position; but it has been satisfactorily proved by Mr. Eaton Hodgkinson that this ratio has a separate value for each substance. In wood, where the ratio is one of equality, the neutral axis in a beam supported at both ends, whose section is rectangular, passes lengthwise through the center of the beam; while in cast-iron, in which the resistance to compression is greater than that to extension, it is a little above, and in wrought-iron, in which the contrary is the case, it is a little below, the center.

NEUTRAL SALTS. See SALTS.

NEUTRALS, nations who, when a war is being carried on, take no part in the contest, and evince no particular friendship for or hostility to any of the belligerents. As a general rule neutrals should conduct themselves with perfect impartiality, and do nothing which can be considered as favoring one belligerent more than another.

The duties and obligations of neutrals at sea have given rise to many complicated questions. It is allowed on all hands that a neutral state forfeits her character of neutrality by furnishing to either belligerent any of the articles that come under the denomination of contraband of war (q.v.). If she does so, the other belligerent is warranted in intercepting the succors, and confiscating them as lawful prize. Contraband of war, besides warlike stores, has sometimes been held to include various other articles, a supply of which is necessary for the prosecution of the war; and it has been doubted how far, in some circumstances, corn, hay, and coal may not come under that category.

An important question regarding the rights of neutrals is, whether enemies' goods not contraband of war may be lawfully conveyed in neutral bottoms. The principle that free ships make free goods was long resisted by this and other maritime countries; and the general understanding has been that belligerents have a right of visiting and searching neutral vessels for the purpose of ascertaining—First, whether the ship is really neutral, as the hoisting of a neutral flag affords no absolute security that it is so; Second, whether it has contraband of war or enemies' property on board. Neutral ships have therefore been held bound to provide themselves with passports from their government, and such papers as are necessary to prove the property of the ship and cargo; and it is their duty to heave to when summoned by the cruisers of either belligerent. It has been considered that a neutral ship which seeks to avoid search by crowding sail, or by open force, may be captured and confiscated. When a merchant-ship is sailing under convoy of a vessel of war it has been said that the declaration of the officer in command of the convoy that there is no contraband of war or belligerent property on board is sufficient to bar the exercise of the right of search.

A declaration having important bearings on the rights of neutrals was adopted by the plenipotentiaries of Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, assembled in congress at Paris on April 16, 1856. By its provisions, 1. Privateering is abolished. 2. A neutral flag covers enemies' goods, with the exception of contraband of war. 3. Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy's flag. 4. Blockades, in order to be binding, must be effective —that is, maintained by a force sufficient really to prevent access to the coast of the enemy.

It has sometimes been proposed to exempt private property at sea from attack during war. Such a project, however, seems inexpedient. There may be a propriety in respecting the property of individuals on land in a time of war, because its destruction, however injurious to the persons immediately concerned, can have little influence on the decision of the contest. But at sea private property is destroyed, because those from whom it is taken, being purveyors or carriers for the community at large, its loss must seriously affect the public, and have no small influence in bringing the contest to an end. See BLOCKADE, PRIVATEER.

NEU'WIED, a t. of Rhenish Prussia, on the right bank of the Rhine, 8 m. below Coblenz. It is the capital of the principality of Wied, now mediatized and attached to Prussia, and is the seat of the princes of Wied, with a beautiful castle. It was founded in the beginning of the 18th c. by prince Alexander of Wied-Newweid, who, offering perfect toleration in religious matters, as an inducement, invited colonists of whatever persuasion to settle here. The town is well built, with wide, straight streets, running at right angles to each other, and contains the churches of Protestants, Catholics, Jews, Herrnhuters, etc. The inhabitants are well-conditioned, and industrious. Pop. '80, 9,656, who carry on manufactures of hosiery, woolen and cotton fabrics, iron-wares, leather, and tobacco.

NE'VA, a river of Russia, in the government of St. Petersburg, flows westward from the s.w. corner of lake Ladoga to the bay of Cronstadt, in the gulf of Finland. Its length, including windings, is about 40 m., 9 m. of which are within the limits of the city of St. Petersburg; and in some places it is 2,100 ft. broad, and about 56 ft. deep; although at Schlusselburg, where it issues from the lake, and at St. Petersburg, where it enters the sea by several branches, it is shallow. From Cronstadt, goods are brought to St. Petersburg in lighters or in small steamers. By the Ladoga canal the n. communicates with the vast water-system of the Volga, and thus it may be said to join the Baltic with the Caspian sea. Its current is very rapid, and the volume of its waters is immense. It is covered by drift-ice for upward of five months—from about Nov. 25 to April 27. An extensive traffic is carried on on its waters, both from the interior, and from the Baltic.

NEVA'DA, one of the states of North America, is bound on the w. by California; on the s. by California and Arizona; on the e. by Utah and Arizona; and on the n. by Oregon and Idaho. Lat. 35° to 42° n.; long. 114° to 120° w.; area, 104,125 sq. miles. The population in 1870 was 42,491 (including 3,152 Chinese), besides 4,000 tribal Indians. The chief river is the Humboldt. The principal lakes are the Mud lakes, Pyramid lakes, and the Walker and Carson lakes. Nevada is the center of that elevated basin which reaches westward from the Rocky mountains to the Sierra Nevada, at a mean altitude of about 4,000 ft. above the level of the sea. Numerous mines, either of gold or silver, have been discovered. The whole country is rich in mineral wealth. Besides gold and silver, quicksilver, lead, and antimony are found. The territorial capital is Carson city (pop. '70, 3,042); the principal town is Virginia city (pop. '70, 7,048). The product of silver in Nevada during the decade 1859 to 1869 was valued at $137,382,000; in 1875 its value was about $40,478,369.

NEVADA (*ante*) is a portion of the territory acquired by the United States from Mexico under the treaty of Guadalupe Hildalgo, belonging previous to its transfer to the "department of Alta California." Prior to its acquisition by the government it was inhabited only by the aboriginal races, there being no settlement of civilized people, not even a mission, within its borders. The first settlements were made in 1848 by the

PACIFIC STATES AND TERRITORIES.

ENGRAVED FOR THE AMERICAN UNIVERSAL CYCLOPÆDIA. COPYRIGHT, 1883, BY CHARLES M GREEN.

Mormons, some of whom, in passing back and forth between California and Salt lake, observing the excellence of the land, located in the Carson and Washoe valleys. The following year they were joined by a few adventurers, who, attracted by the gold discoveries in California, had made the journey overland, but stopped on finding here the object for which they had set out. From this time the population gradually increased until in 1859, when silver was discovered, it had swelled to about 1000 people. During the next two years it increased to 17,000 ; and, after ten years, by the returns of the census of 1880, the population was 62,266. It was constituted a territory in Mar., 1861, and was admitted into the union as a state in Oct., 1864.

Viewed as a whole, geographically, the state, in common with the great American basin of which it forms a part, may be considered an elevated plateau, having a general altitude of more than 4,000 ft. above tide-water. Traversing this lofty plain are numerous chains of mountains, separated by valleys having a width varying from 5 to 20 m., and usually about equal to that of the adjacent mountains measured through their bases. The course of these valleys is, as a general thing, parallel to the main axis of the mountains, which have for the most part a northerly and southerly strike. These mountains vary in height from 1000 to 5,000 ft. above the common level of the country, having therefore an absolute elevation of from 5,000 to 9,000 ft. above the sea. For a distance of nearly 300 m. the Sierra Nevadas form a natural barrier along its western and south-western border, the boundary line between this state and California running partially upon its summit and partially along or near the eastern base of this range, which, though not here attaining its greatest altitude, has nevertheless within the limits of Nevada a general height of more than 7,000 ft., a few of the loftier peaks reaching a height of 10,000 feet. The mountains are covered nearly everywhere from base to summit with a growth of forests, consisting of a variety of pine, spruce, and fir, which are well adapted to make superior lumber. No oak or other hard wood of any size is found on this slope of the Sierra, nor, indeed, in any other part of Nevada. The alternation of mountains and valleys is preserved with much regularity throughout the state, being most marked in the central portion. Sometimes the former contract or are so broken up as to transform the valleys into broad plains or basins, some of which are open and unobstructed, while others are covered with isolated clusters of rugged hills. Through a few of these run streams of water supplied from the mountain rills, and in these much of the land is arable, the quantity usually being proportioned by the size of the stream. In the valleys, however, that have no streams there is scarcely any land that can be used for agriculture. In fact, the more extended plains are marked by a great degree of sterility, being destitute for the most part of wood and only scantily supplied with grass. This system of valleys and plains, inclosed by mountains, and sometimes connected with each other, constitutes a series of basins, each having a drainage of its own, but scarcely any of them having an outlet to the sea. To this mode of drainage Nevada, as well as many other parts of the great basin, is entitled for some of its peculiar topographical and geological features, the common receptacle of the gathered waters becoming, according to circumstances, a lake, a meadow, an alkali flat, or a salt-bed. The Humboldt, the longest and largest river in the state, is usually fordable in many places; and the Reese river, though having a length of nearly 150 m., is not over 10 or 15 ft. wide, nor has it an average depth of more than 2 feet. Like the other rivers of the state, these terminate in small lakes and pools. In respect to the approximate amount of land of the different qualities, the state surveyor's report for 1874 stated that the agricultural land amounted in that year to 1,505,000 acres; grazing land, 22,210,276 acres; timbered land, 3,699,700 acres; and that the mineral lands already opened were 2,582,720 acres. The entire amount of mineral land is believed to exceed 6,000,000 acres; the amount of agricultural land is 17,608,960 acres; of reclaimable swamp-lands, 74,880 acres. The barren and worthless sandy lands amount to about 2,151,680 acres.

While the state will never be largely agricultural, it possesses, as will be noticed from the above estimate, an amount of arable land that will probably quite supply its own needs. Its great wealth is in its mines and mineral resources. Besides the precious metals, there have been found within its boundary lead, copper, iron, platinum, tin, zinc, antimony, nickel, cobalt, and arsenic; beds of pure sulphur, gypsum, rock salt, nitrate of potassa, carbonate of soda in large quantities, borax, lignite or brown coal, kaolin, etc. Gold and silver are commonly found associated with each other, gold predominating in the Antelope, Tuscarora, Gold mountain, Sacramento, and Sierra districts. Silver, however, is the staple mineral product, but the yield of this metal is not rapidly increasing. The Comstock lode, in Storrey co., discovered 1859, was for years the most valuable silver bearing lode in the world, its annual yield having been $16,000,000. It now yields principally low-grade ore. Silver bearing and gold lodes are worked in 12 counties, at least. The leading mining counties are Esmeralda, Eureka, Humboldt, and Lander. The mining interests have of late centered in the White river district, which has an area of abt. 12 sq.m. Among important mines are the White Pine, 125 m. n.e. of Elk's station on the Pacific r.r., Consolidated Virginia, California, and Sierra Nevada. The last two, in 1881, had been worked to a depth of 2,700 ft. The state yield of gold in 1883 was $2,520,000 ; of silver, $5,430,000 ; the total, over $1,200,000 less than in 1882.

The interest manifested in agriculture and stock-raising throughout Nevada has

greatly increased during the past six years. In agricultural industry in 1883 the agricultural report showed that there were 123,802 acres of land devoted to corn, wheat, oats, barley, potatoes, and hay, and that there were raised, among other products, 415,815 bushels of potatoes; 458,640 bushels of barley; 129,487 tons of hay; in 1884, 21,000 bush. corn; 104,000 bush. wheat; 251,006 bush. oats were raised. Numbers of live stock in 1883 were 39,326 horses; 1,406 mules and asses; 16,029 milch cows; 218,360 oxen and other cattle; 385,350 sheep; and 13,200 hogs. The census of 1880 shows the number of manufacturing establishments to have been at that period 184, which employed 577 hands, and had a capital invested of $123,300. The number of railroads in the state in 1884 was 11, and their entire mileage, 948 miles. The chief among these were the Central Pacific, which crosses Nevada from e. to w., connecting with San Francisco and the Union Pacific railroad; the Virginia and Truckee, from Reno on the Central Pacific to Virginia; the Nevada Central and the Carson and Colorado; the Eureka and Palisade railroad, from Palisade on the Central Pacific to Eureka. On Nov. 1, 1883, the funded debt was $555,000. The assessed valuation of real and personal property for 1882 was $27,369,356. The post-office receipts in 1884 were $58,196. Able-bodied male residents, from 21 to 60 years, pay a poll-tax of $2.00, and on non-payment may be debarred from voting.

The school fund in 1881–82 amounted to $564,000; receipts for public schools, $182,005; expenses, $154,327; children enrolled, 8,158; average monthly pay: men, $101.59, women, $76.73. Education is, by law, compulsory, but the law is not enforced. There are no normal schools, but teachers' institutes are held. There were, in 1882, 136 graded schools, and 6 high schools. There is a school for girls (P. E.) at Reno; the state has a university at Elko, and an orphans' home at Carson city. Public funds cannot be used for sectarian purposes. The principal denominations are the Adventist, Baptist, Congregational, Jewish, Methodist, Mormon, Presbyterian, Protestant Episcopal, and Roman Catholic. In 1884, 32 newspapers and periodicals were published. The streams and lakes have been stocked with salmon, perch, and other fish.

The constitution of Nevada provides that every male citizen who has attained the age of 21 years, and who is neither insane, an idiot, nor an unpardoned felon, shall be entitled to vote; suffrage and office may not be withheld on account of color. General elections occur on the Tuesdays next after the first Monday of November of even years. The state is entitled to two representatives in the U. S. senate and one in the house of representatives, and consequently to three electoral votes. The following is the state's electoral record: 1864, Abraham Lincoln, 3; 1868, Ulysses S. Grant, 3; 1872, Ulysses S. Grant, 3; 1876, Rutherford B. Hayes, 3; 1880, James A. Garfield, 3; 1884, James G. Blaine, 3.

NEVADA, a co. in s.w. Arkansas, bounded on the n. and n.e. by the Little Missouri river, and drained by Terre Rouge creek and Cypress bayou; about 600 sq.m.; pop. '80, 12,959—3,732 colored. The surface is diversified and heavily wooded, and the soil in the valleys fertile. The principal productions are cotton and Indian corn. It was set off from Ouachita and Columbia counties. It is on the St. Louis, Iron Mountain, and Southern railroads. Co. seat, Prescott.

NEVADA, a co. in n.e. California, adjoining Nevada, bounded on the n.w. by the Middle Yuba river, drained by Bear creek and the South Yuba river, and crossed by the Central Pacific railroad; 1,050 sq.m.; pop. '80, 20,823—12,360 of American birth. The surface is irregular and mountainous, particularly in the e. portions, which are traversed by the Sierra Nevada. There are immense forests of evergreen trees. The soil in the river valleys and on the plains is fertile. The county contains Donner lake, a summer resort, and the mountain scenery in the e. is much admired. The principal agricultural productions are potatoes, butter, wine, and hay. There are breweries, flouring and saw mills, metal-ware manufactories, and machine-shops. But agriculture is little followed, the chief industry being gold mining. About one-half of the area contains valuable mineral deposits. Some of the richest veins of quartz in the state are found here, and there is a large number of mines, placer, hydraulic, and quartz. The placer mining is especially valuable. Limestone and granite abound. Large quantities of timber are exported. Co. seat, Nevada City.

NEVADA CITY, a t. in n. California, the terminus of the Nevada County narrow gauge railroad from this point to Colfax, connecting there with the Central Pacific; pop. '80, 4,022. It is the co. seat of Nevada co., in the midst of a mountainous region containing valuable gold mines, supplying 6 quartz mills. It is on Deer creek, 5 m. n.e. of Grass Valley, 33 m. e. of Marysville, and 65 m. n.e. of Sacramento. Its climate is considered very healthy, especially for consumptives, and its natural scenery attracts many visitors. It has 5 churches and several hotels, and is well built, mostly of brick. It has one newspaper, good public schools, a court-house, a bank, a masonic hall and places of meeting for all the secret orders, and an iron-foundry. The principal occupation is the cultivation of fruit and vines, and considerable wine is made.

NEVADA, Emma (stage name of Emma Wixom.) See page 888.

NEVERS, a t. of France, capital of the department of Nièvre, and formerly the capital of the province of Nivernais, is built on a hill in the midst of fertile plains, at the confluence of the Loire and the Nièvre, 140 m. s.s.e. of Paris. Highly picturesque, as seen from a distance, its interior shows steep, winding, and badly-paved streets. It contains a beautiful cathedral of the 10th c., and a fine public garden; the large cavalry barrack, the fine bridge of 20 arches over the Loire, and the triumphal arch, erected in 1746, to

commemorate the battle of Fontenoy, are also worthy of mention. Nevers is the see of a bishop, contains a public library, and has numerous educational, scientific, and benevolent institutions, and an arsenal. There is here an important cannon-foundry, and the principal manufactures are porcelain and earthenware, glass, brandy, iron cables and chains, and anvils. Pop. '81, 21,722.

Nevers, the *Noviodunum* of the Romans, existed prior to the invasion of Gaul by Julius Cæsar. It has been the seat of a bishop since the beginning of the 6th c., when it was called Nevirnum, became a co. in the 10th c., and was erected into a duchy by Francis I. in 1538.

NEVIANSK', a t. of Russia, in the government of Perm, 50 m. n. from Ekaterinburg. It is on the eastern or Siberian side of the Ural mountains, and stands on the Neiva, the waters of which flow by the Tobol and the Irtish to the Obi. The district around Neviansk is famous for its mineral wealth, particularly for its productiveness of gold, copper, and platinum. Neviansk has a mint, the tower of which is remarkable as leaning even more than the celebrated tower of Pisa. Pop. 18,000.

NE'VILLE'S CROSS. See BRUCE, DAVID.

NEVIN, JOHN WILLIAMSON, D.D., LL.D., b. Penn., 1803; graduated at Union college 1821; studied in the theological seminary at Princeton, and remained there some time as an instructor, and wrote *Biblical Antiquities* (2 vols). In 1829–39 he was professor of Hebrew and Biblical literature in the Presbyterian theological seminary at Allegheny City; in 1840 became professor of theology and president of the German Reformed theological seminary at Mercersburg, Penn., and also, 1841, president of Marshall college at the same place; in 1843 published *The Anxious Bench*, which produced much discussion on the subject of revivals; in 1844 translated Dr. Schaff's inaugural address, *The Principle of Protestantism*, which was viewed as containing the germ of what was afterward called "Mercersburg theology" (q.v.), and was followed by *The Mystical Presence; History and Genius of the Heidelberg Catechism*, and *Anti-Christ, or the Spirit of Sect and Schism*. Dr. Nevin also edited the *Mercersburg Review*, 1849–53; in 1851 he resigned the presidency of the seminary, and, in 1853, of the college, on its removal to Lancaster to be consolidated with Franklin college. He was afterward chosen president of Franklin and Marshall college, and still holds the position.

NE'VIS, a small island of the West Indies, belonging to Great Britain, forms one of the group of the Lesser Antillies, and lies immediately s.e. of St. Christopher's, from which it is separated by a strait, called the *Narrows*, two m. wide. It is circular in form, rises in a central peak to the height of about 2500 ft., and has an area of 20 sq.m. Pop. '81, 11,864, of whom very few are white. Charlestown, a seaport, with a tolerable roadstead, situated on the s.w. shore of the island, is the seat of government, consisting of a government council and general assembly. The soil is fertile, and the principal products are sugar, molasses, and rum. In 1875 the revenue of Nevis was £10,001 ; and the expenditure £9,526. The imports for 1873 were valued at £52,293 ; and the exports at £83,225. The value of the sugar exported was £72,342, more than double the value of the year before, but only about £6,000 more than in 1871. The tonnage of vessels entering and clearing in 1880 amounted to 19,030.

NEW, JOHN C., b. Ind., 1831, educated at Bethany college, West Virginia; a graduate of the class of '53; studied law, but turned his attention to politics and never became a practitioner. He has served his native state in the capacity of state senator, and filled the office of adjt.gen. of Indiana; was cashier of the first national bank of Indiana, and in 1875 was appointed U. S. treasurer under president Grant. In 1879–80 he was chairman of the Indiana republican committee.

NEW ALBANY, a city in Indiana, United States, on the n. bank of the Ohio river, at the foot of the falls, opposite Portland, and 2 m. below Louisville, Ky.; a finely-situated, well-built town, having 22 miles of streets, 6 ship-yards, 6 foundries, 30 churches, and is the site of Asbury college and a collegiate institute. It has a large river-trade and railway connections with Indiana and Kentucky. Pop. '70, 15,396; '74, 22,246.

NEW ALBANY (*ante*), the co. seat of Floyd co., on the Louisville, New Albany, and Chicago railroad; pop. '80, 16,422. It has manufactories of cars, engines, and boilers; rolling, planing, and flour mills, iron foundries, etc. It has 1 daily and 2 weekly newspapers and 4 national banks.

NEW'ARK, a municipal and parliamentary borough of England, in the co. of Notts, on the Great Northern and Midland railways, and on a navigable branch of the river Trent, 16 m. s.w. of Lincoln. The parish church, a large and elegant edifice, though often rebuilt, still shows traces of its original Norman character. Newark is approached from the n. by a causeway a mile and a half long, carried over the flat island formed by the Trent on the w. and the Newark branch on the east. The castle of Newark, in which king John died in 1216, was built early in the 12th century. Newark is said to be the greatest malting town in England; there are flour-mills, breweries, and trade in corn, malt, flour, cattle, wool, and coal. A corn exchange has been recently erected. Newark returns two members to parliament. Pop. '81, 14,019.

NEW'ARK, a city and port of entry of New Jersey, United States, on the w. bank of the Passaic river, 12 m. from New York, on the New Jersey railway. It is a handsome and industrious city; its principal street is 2 m. long, 140 ft. wide, shaded by great elms, and bordering on three public parks. It contains a custom-house and post-office, 115 churches, numerous public schools, 11 banks, 23 periodicals, and extensive manufactories of leather, patent leather, enameled cloth, carriages, saddles and harness, boots and shoes, clothing, hats, jewelry—1319 establishments producing annually $75,000,000. It was settled in 1666 by a Puritan colony from Connecticut. Newark has 140 vessels of 12,000 tons. Pop. in '70, 105,059.

NEWARK, a city of Essex co., New Jersey, a port of entry and capital of the co.; pop, '80, 136,400, being an increase of 30 per cent. since 1870. It is situated on an elevated plain on the right bank of the Passaic river, 9 m. from New York city, and 4 m. from Newark bay. Its history is somewhat peculiar. In 1665 the colonies of Hartford and New Haven, Conn., being united in spite of the opposition of the people of Branford, most of the latter deserted that part of the country, headed by their pastor, and taking with them their families and household goods. They bought the land on which Newark now stands, from the Hackensack Indians, for £130, 12 blankets, and 12 guns, and there founded their city, laying it out in broad streets. No one was permitted to hold office, to vote, or was a freeman, who did not have membership in the Congregational church; in 1676 the church building was fortified against attacks by the Indians. In 1682 Newark was famous for the manufacture of cider. In 1745–46 the English grantees of East Jersey undertook to invalidate the titles of the Puritans to their lands, whereupon rioting occurred, which was suppressed with difficulty. The college of New Jersey was in Newark from 1747 to '55, and here was founded the Newark academy in 1792. In 1777 the town was occupied by the British, when it was sacked and plundered, and nearly destroyed. The population was 1000 in 1780; 10,950 in 1830; 17,290 in 1840; 71,041 in 1860. Newark contains 115 churches, an academy, high-school, and 25 public schools; 11 banks, 9 horse-railroads, a paid fire department, and a fire-alarm telegraph. Among its public buildings are the city-hall, court-house, and custom-house and post-office. Literary associations are the library association and the state historical society. Newark is a leading manufacturing city, particularly in jewelry, india-rubber and celluloid goods, carriages, leather and machinery. The Passaic flour-mills produce 2000 barrels of flour daily, and a spool-thread company employs 750 girls in its manufactory. The life insurance companies of Newark have $30,000,000 capital, and the fire insurance companies, $6,000,000. There are large shipping interests, and the docks extend a m. in length. The streets in the city cover 150 m. in length, and there are 40 m. of sewers. A short distance from Newark are brown-stone quarries which supply great quantities of building material for New York.

NEWARK, a city in Ohio, capital of Licking co.; situated at the union of three branches of the Licking river; pop. '80, 9,600. It is on the Ohio canal, and the Baltimore and Ohio, and Pittsburg, Cincinnati, and St. Louis railroads. It is built on an extended plain, surrounded by a fertile and productive country. and is laid out attractively, with broad streets. It has a graded public school system. In the neighborhood are sandstone quarries, a coal mine, and petroleum refineries.

NEWAY'GO, a co. in w. Michigan, intersected in the s. by the Grand Rapids, Newaygo and Lake Shore railroad, one division terminating at Everett, and another, from Big Rapids to Muskegon, crossing it centrally; 864 sq.m.; pop. '80, 14,688—11,902 of American birth, 146 colored. Its surface is generally level, largely covered with forests of hard wood and sugar maple. It is drained by the head-waters of the Muskegon, Marquette, and White rivers. Its soil is fertile and adapted to the production of wheat, rye, corn, oats, potatoes, wool, dairy products, and maple sugar. Its rivers furnish valuable water-power, and it has manufactories of lumber, sashes, and shingles. Much attention is paid to stock raising. Co. seat, Newaygo Court-House.

NEW BEDFORD, a seaport city of Massachusetts, on Buzzard's bay, 55 m. s. of Boston. Since 1755 it has been the chief center of the American whale fisheries. The value of this industry has been for many years on the decline. The trade was at its height in 1853–54, when there were in the district 410 whalers of 132,966 tons, which brought home 44,923 bbls. of sperm oil, 118,672 bbls. of whale oil, and 2,838,800 lbs. of whalebone. In 1873 New Bedford possessed 128 whalers, which brought home 30,961 bbls. of sperm oil, 25,729 bbls. of whale oil, and 150,598 lbs. of whalebone. It had oil and candle factories, cotton mills, iron mills, copper and glass works, 30 churches, 6 banks, 2 daily and 2 weekly newspapers, a public library of 30,000 volumes, city hall, custom-house, and alms-house. Pop. '70, 21,320.

NEW BEDFORD (*ante*), a city in e. Massachusetts, set off from Dartmouth, 1787, incorporated 1847, on the w. bank of Acushnet river, near its mouth; pop. '80, 26,875. It is one of the capitals of Bristol co., and has become a manufacturing city of considerable importance. Besides its reciprocal trade with other ports, it is a shipping place for coal consigned to the south. It is connected with Boston by two railroad routes owned by the Old Colony railroad, the road across the river affording a route to cape Cod, through Fairhaven, and the other, through Taunton direct, to Boston. Propellers run

from this port to New York, and steamers to Martha's Vineyard. It has public schools, a high-school building erected at a cost of $126,000, an academy under the direction of the society of Friends, and 27 churches. The public library was opened to the public by the city in 1852, and was one of the first free public libraries in the United States. In 1857 it was placed in a commodious and convenient building, costing $45,000. A fund of $100,000 was bequeathed to the city by the late Sylvia A. Howland for the promotion of liberal education, and for the introduction of water into the city. Among its institutions is the union for good works, a worthy charity accomplishing much toward the relief of the suffering poor. It also contains St. Joseph's hospital (Catholic), an orphan asylum, a well-organized fire department with 5 steam fire-engines, an electric fire-alarm telegraph, and a horse railroad constructed in 1872. It is well supplied with water from Acushnet pond, the works having been erected in 1867–69 at a cost of $1,000,000, the reservoir having a capacity of 400,000,000 gallons. The water is carried 6 m. and raised 100 feet. It is lighted by gas. Among its industries are the manufacture of Prussian blue, paraffine candles, cordage, shoes, etc., and it has oil and paint works, two manufacturing photographic establishments, and tanneries. It contains seven banks, five of them national, fire and marine insurance companies, daily and weekly newspapers, and a weekly shipping list. The Clarke's Cove fertilizing company has been lately established, its buildings covering 40,000 sq.ft. of land. Among some of the more recently built factories are the Wamsutta mills, making superior cotton cloth, and having a capital of $2,500,000; the Potomska mills, making print cloths, with a capital of $900,000; the Morse twist drill factory; and the Gosnold iron mill, named in honor of Bartholomew Gosnold, an English mariner, who attempted to colonize New England in 1602, and named cape Cod. It is 11 m. in length and 2 m. in width, and is regularly laid out, with streets at right angles, shaded by maples and ancient elms that, on some streets, almost meet and form an arch over the wide thoroughfares. The land slopes toward the water, and the elevated portion offers fine sites for the erection of the elegant private residences for which the city is noted. The river is crossed by a bridge 4,000 ft. long connecting the city with Fairhaven. It has an elegant drive 4½ m. in extent around Clarke's point, commanding an unobstructed view of the harbor and far out to sea. A granite fort, situated on the extremity of the point, commands the entrance to the harbor, which is convenient and easily approached. Its valuation is larger than any other city of its size in the United States in proportion to its population. In 1883 the valuation for real estate was $15,180,305; personal, $15,909,300.

NEW BERNE, a city and port of entry of North Carolina, on the s. bank of the Neuse river, at its confluence with the Trent, 30 m. from its mouth in Pamlico sound. It exports tar, turpentine, naval stores, flour, and lumber. Pop. '70, 5,849.

NEW BERNE (*ante*) is the port of entry of Pamlico district, 40 m. from the mouth of the Neuse river, on the Atlantic and North Carolina railroad. It has a considerable commerce, having direct communication with the sea by way of Ocracoke inlet. Its chief trade is coastwise, in fish, cotton, lumber, and naval stores. Its manufactures include agricultural implements, carriages, etc., and it has turpentine distilleries, grist and saw mills, foundries, and machine shops. In 1862, during the rebellion, gen. Burnside was sent to New Berne at the head of an important expedition, designed to weaken the enemy by interfering with their base of supplies, and by the occupation of a point at which a threatening attitude could be constantly maintained: it was entirely successful; and on Mar. 14 the city was captured after a severe engagement, being well defended by strong intrenchments. Sixty-nine cannon and a large quantity of ammunition were taken, and the city was seriously damaged. Pop. '80, 6,443.

NEWBERRY, a co. in central South Carolina, having the Saluda river for its s. boundary, the Ennowee and Tiger rivers for its n., and the Broad river for its e. boundary; 700 sq.m.; pop. '80, 26,497—26,383 of American birth, 18,262 colored. It is intersected by the Greenville and Columbia railroad, and the Laurens railroad terminates at Newberry. Its surface is undulating, in some portions rising into considerable elevations, and timber is abundant. It has extensive granite ledges, and the soil is fertile, especially the alluvial soil near the rivers. Cattle, sheep, and swine are raised; and wheat, corn, oats, sweet potatoes, and cotton are the chief products. It has steam sawmills and a few manufactories. Co. seat, Newberry Court-House, an important cotton mart.

NEWBERRY, JOHN STRONG, M.D., LL.D.; b. Conn., 1822. In 1824 his father emigrated with his family to Ohio, and founded the town of Cuyahoga Falls. Newberry graduated from Western Reserve college in 1846, and from the Cleveland medical college in 1848. After two years of study and travel abroad he settled down to the practice of medicine in Cleveland, but his growing fondness for natural science led him to accept the appointment of assistant surgeon and geologist on lieut. Williamson's survey of northern California and Oregon in 1855. Newberry's researches were published in a separate quarto volume, as well as in the Pacific railroad reports. In 1857–58 he accompanied lieut. J. C. Ives's expedition to the Colorado river, taking out an iron steamer in sections and navigating that stream for 500 miles. Newberry's portion of the report was acknowledged by his commander to constitute "the most interesting material gathered by the expedition." He assisted, in 1859, capt. Macomb's exploration of the

upper Colorado and San Juan rivers, opening up an interesting region of immense mineral resources, and published a report on it. During the rebellion his administrative capacity was demonstrated by his superintendence, as secretary, of the affairs of the sanitary commission throughout the Mississippi valley In 1866 he was appointed to, and still continues to hold, the professorship of geology and paleontology in the school of mines of Columbia college. He has been state geologist of Ohio since 1869, and completed an exhaustive geological survey of the state within five years, the final reports of which, now in process of publication, will make eight volumes, besides a map. Prof. Newberry has made many contributions to the literature of fossil fishes and plants, and geology in general. He is a member of numerous American and European scientific societies, and is now president of the New York academy of sciences.

NEW BRIGHTON, a village in s. New York, on the n.e. shore of Staten island, in the s. portion of New York harbor, 6 m. s.w. of the city. Pop. '80, 12,679. It is in Castleton township in the county of Richmond, and contains the post-office of West New Brighton. It is connected with the metropolis by steam ferries, and has many elegant villas occupied by persons engaged in business who make the trip daily. It is the seat of "Sailors' Snug Harbor," a hospital or home for mariners who are past their usefulness, and also for the destitute sick or infirm families of seamen. It has 9 churches and a number of fine hotels. Its situation is on an elevation which commands a magnificent view of the bay, and granite is found in the immediate neighborhood. Its manufacturing establishments are a paper-hanging factory, silk-printing works, a fancy dyeing establishment, and dyeing and printing works, which are very extensive.

NEW BRIGHTON, a borough in w. Pennsylvania, on the Pittsburg, Fort Wayne and Chicago railroad; pop. '80, 3,653. It is on the e. bank of the Beaver river, which furnishes very extensive and valuable water-power, and is 28 m. n.w. of Pittsburg, and 21 m. s. of New Castle. The Beaver river empties into the Ohio 3 m. below. It has 10 churches, 3 banks, one of which is national, a public library, a newspaper, and excellent schools. It is connected with the town of Beaver Falls by a bridge across the river. It is in a coal region, and is connected with lake Erie by the Beaver and Erie canal. Its manufactures are important; among its industries may be numbered the manufacture of chairs, woolen goods, twine, nails, pottery, lead-kegs, coffee-mills, rivets, wire, etc. It has a variety of stores and an extensive greenhouse.

NEW BRITAIN, a manufacturing t. in Connecticut, 10 m. s. of Hartford, engaged in the production of stockinet goods, locks, jewelry, hooks and eyes, and various kinds of hardware. It has six churches. The water supply is from a reservoir of 175 acres, with a head of 200 feet, supplying public fountains with jets of 140 feet, and dispensing with fire-engines. Pop. '80, 11,800. It is a beautiful and prosperous place.

NEW BRITAIN, the name of one principal and of several subsidiary islands in the Pacific ocean, in lat. between 4° and 6° s., and long. between 148° and 152° 30′ e. The principal island, 300 m. in length, and having an area of 12,000 sq.m., lies e. of New Guinea, from which it is separated by Dampier's straits. The surface is mountainous in the interior, with active volcanoes in the north, but along the coast are fertile plains. Forests abound in the island, and palms, sugar-cane, bread-fruit, etc., are produced. The inhabitants, the number of whom is unknown, are described as a tribe of "oriental negroes," and are well-formed, active, and of a very dark complexion. They are further advanced in civilization than is usual among the Polynesians, have a formal religious worship, temples, and images of their deities. New Britain was first seen by Le Maire and Schouten in 1616, but Dampier, at a later date, was the first to land.

NEW BRUNSWICK, a city of New Jersey, is on the s, bank of the Raritan river, at the head of navigation, 15 m. from its mouth, 30 m. s.w. of New York, on the New Jersey railway, and the Delaware and Raritan canal. It has extensive manufactures of cotton, leather, india rubber, paper-hangings, iron, and machinery, 17 churches, 2 banks, and 4 newspapers. It is the seat of Rutger's college and a theological seminary. Pop. '60, 11,255; '80, 17,166. The city is attractive as a place of residence.

NEW BRUNSWICK, a province of the Dominion of Canada, is bounded on the n.w. by Canada and the bay of Chaleur, on the n.e. by the gulf of St. Lawrence and the strait of Northumberland, on the s. by Nova Scotia and the bay of Fundy, and on the s.w. by the state of Maine. It has an area of 27,720 sq.m., or 17,734,400 acres (rather more than the area of Scotland), and a population, in 1881, of 321,129. The coast line is 500 m. in extent, and is indented by spacious bays, inlets, and harbors, which afford safe and commodious anchorage for shipping. The chief are Fundy, Chignecto, and Cumberland bays, the last two being merely extensions of the first; Passamaquoddy bay in the s.; Verte, Shediac, Cocaigne, Richibucto, and Miramichi bays on the n.e.; and the bay of Chaleur, 80 m. long by 27 broad, in the n.w. The province of New Brunswick abounds in rivers. The principal are the St. John and the St. Croix, the former 450, and the latter 100 m. in length, and both falling into the bay of Fundy; and of the rivers that flow eastward into the gulf of St. Lawrence, the Richibucto, the Miramichi, and the Restigouche. The province contains numerous lakes, one of which, Grand lake, is 100 sq.m. in area. Most of the others are much smaller. The surface is for the most part flat or undulating. With the exception of the district in the n.w. bordering on

Canada and the river Restigouche, no portion of New Brunswick is marked by any considerable elevation. Here, however, the country is beautifully diversified by hills of 500 to 800 ft. in height. These elevations, which form an extension of the Appalachian range, are interspersed with fertile valleys and table-lands, and are clothed almost to their summits with lofty forest-trees. In this district the scenery is remarkably beautiful. In the s. of the colony the surface is broken up by great ravines, and the coast is bold and rocky. The shores on the e. coast, and for 20 m. inland, are flat. The soil is deep and fertile. Of the whole acreage, 14,000,000 acres are set down as good land, and 3,600,000 acres as poor land. New Brunswick contains a rich and extensive wheat-producing district; but the inhabitants, dividing their time between farming, lumbering, fishing, ship-building, and other pursuits, and following no regular system of tillage, have not till quite recently attempted to keep pace with modern agricultural improvements. The farming has not been judicious; many parts of the country have been allowed to become exhausted; and, although signs of improvement begin to be manifest, still there is prevalent a deplorable lack of knowledge of the principles of scientific agriculture. Several cheese factories have been established in the province within the last few years. In one year one of these has manufactured as much as 25,000 lbs. The crown lands are at present being disposed of under the act 31 Vict. cap. 7, 1868. This act provides that certain portions of eligible land shall be reserved for actual settlers, and not be disposed of to speculators, or for lumbering purposes. A male of 18 years of age or upwards may obtain 100 acres, either by payment, in advance, of $20 (£4 3s.), to aid in the construction of roads and bridges in the vicinity of his location, or upon his performing labor on such roads and bridges, to the value of $10 a year, for three years. He must also, within two years, build a house on his land of not less dimensions than 16 ft. by 20, and clear two acres. After a residence for three years in succession he receives a deed of grant if he has paid the $20 in advance or cultivated ten acres. By act of 1872, a single man obtains 100 acres ; a married man with children, 200. A house must be built, and some land cultivated within 3 years, when he receives a present of 30 dollars from the government. The climate is remarkably healthy, and the autumn—and especially the season called the Indian summer—is particularly agreeable. In the interior the heat in summer rises to 80°, and sometimes to 95°; and in winter, which lasts from the middle of December to the middle of March, the mercury sometimes falls as low as 40° below zero. At Fredericton, the capital, situated on St. John river, 65 m. from the s. and 130 m. from the n. coast, the temperature ranges from 35° below to 95° above zero, and the mean is about 42°. Average annual value, imports and exports, about $6,000,000.

The north-western portion of the province is occupied by the upper Silurian formation. Next are two belts of lower Silurian. Small patches of the Devonian, Huronian, and Laurentian systems are found on the bay of Fundy. A large part of the province is occupied by carboniferous strata. The mineral coal is for the most part impure or in thin seams, and is hardly worked; but the so-called Albertite of Albert county is the most valuable of bituminous matter on the American continent. It yields 100 gal. of crude oil per ton. Salt springs are numerous. Copper and iron ore are found, as also antimony and manganese; gypsum, plumbago, and limestone are very abundant, and the free-stone of the province, unsurpassed for beauty and durability, commands a high price in the states. Wild animals abound in the province; the lakes and rivers are well stocked with fish, and along the coasts, cod, haddocks, salmon, and other fish are caught in great plenty. The forests of pine, cedar, and spruce, supply timber for export and ship-building purposes, and are one of the chief sources of wealth in N. B. There are nearly 500 miles of railway in the province. Around the coasts and along the banks of the rivers there are excellent public and coach roads. By an act of 1871 a system of free public schools was established, and in 1874 the number of schools in operation was 1,049. Chief towns, the city of St. John, and Fredericton, the political capital. N. B. sends 10 senators and 16 representatives to the Dominion parliament. The provincial government is administered by a lieutenant-governor and council of 9, a legislative council of 15 members, and an assembly of 41 members.

The province of New Brunswick, together with that of Nova Scotia, originally formed one French colony, called Acadia, or New France. It was ceded to the English in 1713, and was first settled by British colonists in 1764. In 1784 it was separated from Nova Scotia, and erected into an independent colony. It joined the Dominion of Canada in 1867.

NEW'BURG, a village of New York, on the w. bank of the Hudson, 61 m. n. of New York, amid the grand scenery of the highlands. Its handsome edifices, villas, and gardens, on a gentle slope from the river, command a noble prospect. It contains a court-house, 5 foundries, a cotton factory, breweries, a railway carriage manufactory, 2 pianoforte manufactories, steam-boiler works, 5 soap factories, 41,000 tons of shipping, a large lumber trade, 23 churches, 5 banks, schools, and academies. It was Washington's headquarters during a critical portion of the war of independence. Pop., '70, 17,014.

NEWBURG (*ante*), situated on a steep slope of the Hudson river, has its water-front lined with warehouses, and enjoys a considerable commerce; pop., '80, 18,050. The locality was seen by Hudson in 1609, who wrote of it: "It is as beautiful a land as one can tread upon; a very pleasant place to build a town on." It was occupied at that

time, and for some years later, by a portion of the Delaware tribe of Indians, who were defeated by the Dutch in the war of 1658–60, and driven away in 1663. In 1709 it was settled by German Lutherans from the Palatinate of the Rhine, who called it "The Palatine Parish of Quassaic." In 1752, the Germans having been displaced, its name was changed to "The Parish of Newburg," from its resemblance to Newburgh on the river Tay in Scotland. It was the headquarters of gen. Washington in 1782–83; and the house which he occupied, in the s. part of the city, is now the property of the state, and is preserved as a historical relic, containing a museum of revolutionary curiosities, open to the public. Here the continental army was disbanded, and it was from this place that the celebrated "Newburg letters" emanated, containing a treasonable suggestion to create Washington "king of America," considered so important that Washington convened the officers of the army in a public building in the city, and addressed them in earnest remonstrance—a course which at once destroyed any possible influence of the letters in question. Newburg is an important coal market, and has some manufactures. It has 23 churches, a public school system, and a water-supply with expensive works. The Newburg and New York railroad connects with the Erie railroad at Turner's. On a height overlooking the city is the theological seminary of the United Presbyterian church. Steamboats connect the city with New York.

NEWBURY, a municipal borough and market t. of Berkshire, England, on both banks of the Kennet, 17 m. w.s.w. of Reading. The church, a specimen of the perpendicular style, was built in the reign of Henry VII.; but the tower was built by John Winchcombe, a clothier and famous citizen of Newbury in the reign of Henry VIII. Since 1862 an annual wool-market has been held here. In 1862 a new corn exchange was built. Newbury is the best known for two hard-fought battles between the royalists and parliamentarian forces which took place—the first in September, 1643, the second in October, 1644. In the former, victory was undecided; in the latter the advantage was on the side of the parliamentarians. Pop., '80, 10,143.

NEWBURYPORT, a city and port of entry of Massachusetts, on the s. bank of the Merrimac river, 3 m. from its mouth, 34 m. n.e. of Boston. Lat. 42° 48′ 30″ n., long. 70° 52′ 3″ w. It is a pretty town, built on a swell of land rising 100 ft. from the river. High st., 3 m. long, shaded with trees, a beautiful mall, and pond of six acres, are its chief ornaments. It has 16 churches, in one of which is the tomb of Whitefield, who died here (1770), 4 banks, 4 manufacturing companies, making 16,000,000 yards of cloth annually, several ship-yards, and manufactories of machinery, hats, clothing, etc.; 2 daily papers, one of which was established in 1792; a free high school, and a free library of 10,000 volumes. Pop., '80, 13,038.

NEWBURYPORT (*ante*), in Essex co., Mass., on the Eastern railroad. It was settled about 1635, and has always been prominent among the towns and cities of the state. During the revolution and in the war of 1812 its citizens were distinguished for their patriotic spirit, and the first privateers fitted out were from this port. In 1851 it received the charter of a city, and since then its population has increased about 4,000. Besides other institutions, the city contains a court-house, a granite custom-house, a city hall, and a marine museum. Ship-building is a prominent business. In 1854 the aggregate tonnage of the vessels built was 20,000; in 1874, 15,000. Its national banks have an aggregate capital of $820,000; and the savings banks have deposits amounting to $5,300,000. The place, which was important for enterprise and wealth more than a c. ago, has an air of antiquity and established social conditions not usual in American cities.

NEW CALABAR RIVER. See CALABAR, *ante*.

NEW CALEDONIA, an island of the South Pacific ocean, belonging to France, and lying about 720 m. e.n.e. of the coast of Queensland, in Australia, in lat. 20°—22° 30′ s., long. 164°—167° e. It is about 200 m. in length, 30 m. in breadth, and has a population estimated at 60,000. It is of volcanic origin, is traversed in the direction of its length, from n.w, to s.e., by a range of mountains, which in some cases reach the height of about 8,000 ft., and is surrounded by sand-banks and coral-reefs. There are secure harbors at port Balade and port St. Vincent, the former on the n.e., the latter on the s.w. part of the island. In the valleys the soil is fruitful, producing the cocoa-nut, banana, mango, breadfruit, etc. The sugar-cane is cultivated, and the vine grows wild. The coasts support considerable tracts of forest, but the mountains are barren. The inhabitants, who resemble the Papuan race, consist of different tribes, some of which are canibals. New Caledonia was discovered by capt. Cook in 1774. In 1853 the French took possession of it, and it has since 1872 been used by the French authorities as a penal settlement. Mission stations have been established. In 1878, some of the natives rose in insurrection and massacred a number of the white residents.

NEW CASTLE, a co. in n. Delaware, having the Delaware river for its e. boundary, the state line of Pennsylvania for its n. and n.w., bounded by the state of Maryland on the w.; 500 sq.m.; pop., '80, 77,746—69,023 of American birth, 12,649 colored. It is intersected by the Philadelphia, Wilmington and Baltimore railroad, the Wilmington and Reading, and the Delaware railroads. It is drained by the Brandywine and Christiana rivers, and Red Clay and Duck creeks, emptying into the Delaware. Its surface is broken, rising into hills in the w. portion, furnishing good pasturage. Its soil is

NEW CALEDONIA, FIJI, AND LOUISIADE ISLANDS.—1. New Caledonian house. 2. Section of house. 3. "Ghost-house," Vanikoro. 4. Section of Louisiade house. 5. New Caledonian ship. 6, 7. Admiralty Island ships. 8. Malanta ship. 9. Vanikoro ship. 10. Spears. 11. Fiji ship. 12. Fiji temple. 13. Mast-head. 14. Head of standard. 15. Drinking-vessels from Fiji Islands. 16. Fiji inn or resting-house among the Fijis. 17. Clubs. 18. King of Fiji. 19, 20. Chieftains in state costume. 21. Basket. 22. Cannibal's cap. 23. Louisiade necklace. 24, 25. Cannibal's tools. 26, 27. Cannibal's fish-hooks. 28, 29. Combs. 30. Lance from Admiralty Islands. 31. Hatchet.

exceptionally fertile, and adapted to the production of grain, dairy products, and fruit, especially peaches; honey and sorghum are among the products. The rivers furnish extensive water-power. Its leading industries are the manufacture of flour, carriages, metallic wares, iron, woolen goods, ships, etc. Co. seat, New castle.

NEW CASTLE, a borough in w. Pennsylvania, on the Beaver and Erie canal, at the junction of the Erie and Pittsburg railroad, the New Castle and Beaver Valley, the New Castle and Franklin, and the Pittsburg and Lake Erie railroads; pop. '80, 8,418. It is the county seat of Lawrence co., on the Shenango river, at the mouth of Neshannock creek ; 50 m. n.w. of Pittsburg. Coal, iron ore, and limestone are mined. Fire-clay is abundant, and it has manufactories of nails, window glass, flour, paper, etc. It has blast furnaces, rolling mills, foundries, grist and planing mills, and breweries. Manufacturing and mining are its principal industries. It is the seat of New Castle college, has excellent public schools in convenient buildings, 12 churches, 5 banks (2 national), and an institution for savings. It has good hotels, a fine opera-house, a variety of stores, and 4 weekly newspapers.

NEWCASTLE, Duke of, THOMAS PELHAM HOLLES, minister of the first two Georges, b. 1692, and representative of the noble family of the Pelhams, played a prominent, but by no means illustrious part in the political history of his time. While a very young man, he succeeded to the family peerage by the death of his father, lord Pelham, and George I. rewarded his attachment to the house of Brunswick by creating him first, earl of Clare, and afterwards duke of Newcastle. He was made secretary of state when but thirty years old, although the king declared that he was not fit to be chamberlain to the smallest court in Germany. There was much of the absurd and grotesque in his character. Macaulay says of him, that "his gait was a shuffling trot; his utterance a rapid stutter; he was always in a hurry; he was never in time; he abounded in fulsome caresses, and in hysterical tears." Yet this man was during thirty years secretary of state, and for near ten years first lord of the treasury! He served under sir R. Walpole, retained his secretaryship in the "broad-bottomed administration" in 1744, and in 1754 succeeded his brother, Mr. Pelham, as head of the government. In 1757 he was compelled to take the first William Pitt (afterwards earl of Chatham), into his ministry, and to give him the lead in the house of commons, and the supreme direction of the war and of foreign affairs. A succession of brilliant victories followed—Newcastle being only nominal head of the administration—and the great commoner had almost brought the war to a successful termination, when the accession of George III. led to the resignation of Mr. Pitt, and the replacement of Newcastle, in May, 1762, by lord Bute, as head of the ministry. Newcastle declined a proffered pension, with the remark that if he could no longer serve he would not burden his country. In the Rockingham ministry, formed in 1765, Newcastle filled the office of privy seal. He died Nov. 17, 1768. His title descended to Henry, ninth earl of Lincoln, whose great-grandson,

HENRY PELHAM-CLINTON, fifth duke of NEWCASTLE, and twelfth earl of Lincoln, was b. 1811, and educated at Christ-church, Oxford. He represented South Notts in parliament from 1832 to 1846, when he was ousted by the influence of his father, the fourth duke, for supporting sir R. Peel in his free-trade measures. He adopted politics as a profession; was a lord of the treasury in the brief conservative administration of 1834–35; and first commissioner of woods and forests in the Peel administration, from 1841 to 1846. He was then made chief secretary to the lord-lieut. of Ireland, but went out of office with his chief a few months afterwards. He succeeded to the dukedom in 1851, and returned to office in 1852, filling the post of secretary of state for the colonies (which formerly included the department of war) in the Aberdeen government. The war with Russia broke out, and in June, 1854, it was found necessary to create a secretary of state for war, and the new office was assigned to Newcastle. The "horrible and heart-rending" sufferings of the British army before Sebastopol in the winter months of 1854 raised a storm of popular discontent, and when the house of commons determined to inquire into the conduct of the war, the duke resigned. Yet, as is now acknowledged, no blame was attributable either to the minister for war or his subordinate, Mr. Sidney Herbert. They were called upon to administer a vicious system of military organization which broke down under the strain brought to bear upon it. Newcastle was reappointed colonial secretary in the second administration of lord Palmerston, and held the seals with general approval from 1859 to the year of his death, 1864. In 1860, as secretary of state for the colonies, he accompanied the youthful prince of Wales during a tour in Canada and a portion of the United States, and on his return received the order of the garter from the queen. He died Oct., 1864.

NEWCASTLE, MARGARET CAVENDISH, Duchess of. See CAVENDISH, MARGARET, *ante*.

NEWCASTLE, WILLIAM CAVENDISH, Duke of. See CAVENDISH, WILLIAM, *ante*.

NEWCASTLE-UNDER-LYME, a parliamentary and municipal borough of England, in the county of Stafford, 16 m. n.n.w. of the town of that name. A branch railway connects it with the North Staffordshire line, and a branch-canal with the Grand Trunk Navigation. One of its churches, rebuilt early in last century, has a very old square tower of red sandstone. The free grammar school has an income of about £100 a year, and

was founded in 1602. Hats are the principal branch of manufacture, and silk, cotton, and paper mills are in operation. Newcastle-under-Lyme is surrounded by famous potteries, and coal-mines are worked in the vicinity. Pop. '81, 17,506.

NEWCASTLE-UPON-TYNE, the chief t. of Northumberland. Lat. 54° 58′ 11.6″ n., long, 1° 36′ 36.5″ west. It has the privileges of a county of itself. Gateshead, which stands upon the opposite side of the river, though in a different county and having a separate jurisdiction, is virtually a part of Newcastle. According to the census of 1881, Newcastle contained a pop. of 145,228, Gateshead, 65,873; making together 211,101 inhabitants. Newcastle sends two members to parliament.

The Romans had a stationary camp here, called Pons Ælii—one of the chain of forts by which the wall of Hadrian was fortified. On the withdrawal of the Romans, the deserted camp became the residence of a colony of monks, and the town was called Monkchester. Robert, eldest son of the conqueror, commenced to build a castle here in 1079 or 1080. Hence the modern name of New Castle. William Rufus built his brother's castle, surrounded the town with a wall, and gave the inhabitants peculiar privileges. The present castle, which displays better than any other in England the genius of Norman military architecture, was erected by Henry II. between the years 1172 and 1177. Newcastle being made the rendezvous of the vast armaments which the first three Edwards led into Scotland, it was in their time surrounded with new walls of unusual strength and magnitude; portions of them yet remain.

The town stands partly upon an elevated platform, and partly upon the n. bank of the river. The more ancient houses in the lower part of the town are chiefly built of timber; those in the center of the town are mostly of stone; but the houses generally are of brick. Chiefly through the instrumentality of one man of humble origin—Richard Grainger—Newcastle has in modern times received the addition of many elegant streets, squares, and public buildings. The river is crossed by three bridges—the High-level bridge, the Redheugh bridge, and a swing bridge (completed in 1874), one of the largest structures of the kind in the world. The High-level bridge forms one of the engineering triumphs of Robert Stephenson. It consists of six cast-iron arches, supported upon piers of masonry. The length of the viaduct is 1337 feet, and the height of the railway above high-water mark, 112. It has a broad carriage-way, by which the ordinary traffic avoids the precipitous streets on both sides of the river, with passenger path on each side, and the railway above. A quay, at which the depth of water at ebb-tide is 22 ft., has been constructed by the corporation, at a cost of over a quarter of a million, or at the rate of about £120 per lineal yard

There are 16 churches and chapels in the town connected with the Established church, and about 60 belonging to other classes of worshipers. The mother church (St. Nicholas) is a noble edifice, chiefly in the decorated style; its steeple, which is singularly light and bold, is early perpendicular. In the Guild hall, an old and somewhat inconvenient building, situated beside the river, the town assizes are opened, and the quarter sessions held. Under the Guild hall proper there is an exchange for the merchants, ship-owners, and brokers of the quay-side. In the Moot hall, a modern and very handsome Grecian building overlooking the swing-bridge, the town and county assizes are held. A new and very spacious town-hall was built about twenty years ago on a block of ground facing St. Nicholas's church; associated with it are a corn market and offices for the transaction of the town business. The market for the sale of butcher-meat and vegetables is probably the most spacious and commodious in the kingdom. All the railways entering the town terminate in a large station near its center. The jail, a heavy and costly mass of building, occupies a low and confined situation. The central police station, police court, and offices, built in 1873, are comprised in a large and handsome structure in Pilgrim street. The new postal and telegraph office, begun in 1873, is one of the largest and finest of the public buildings in the town. There are two theaters—the Royal (the great ornament of Grey street, the handsomest street in the town), and the Tyne theater in Westgate street. Newcastle has two monuments—a column surmounted by a statue of earl Grey, to commemorate the passing of the reform bill, and a bronze statue to George Stephenson.

The corn market is held on Tuesday and Saturday; the hay market and the cattle market on Tuesday. During the year 1873, 81,635 fat cattle, 350,638 sheep and lambs, and 39,585 swine were brought to the cattle market. A very large market is held every Thursday morning for the sale of butter, bacon, cheese, eggs, and other articles of country produce. Saturday is general market day. Newcastle is well supplied with surface water, the chief place of collection being Hallington, about 20 miles n.w. of the town.

The trade of Newcastle consists chiefly in coal, and in those articles in the production of which great heat is required. The Newcastle coal trade had its origin in the reign of Henry III. This branch of industry is not now confined to Newcastle, but is spread over the greater part of the sea-board of Northumberland and the whole of Durham. Nearly 32,000,000 tons of coal and coke were produced in the northern coal field in 1876, of which about 7,000,000 tons were shipped to foreign ports. The number of persons employed in connection with the pits may be computed at 80,000. Since the discovery of the Cleveland ironstone the manufacture of iron has prodigiously increased in the district embraced by the northern coal field. The make in 1876 was about 830,000 tons.

There are annually produced on the Tyne about 3,000 tons of steel. Large quantities of lead, the produce of the mines of Alston Moor and Wcardale, are brought to Newcastle for manufacture. A very large quantity of unrefined lead is also imported from Spain. Having been refined and desilverized, the lead is rolled into sheets and pipes, or converted into shot, litharge, red and white lead. The value of these imports is about £1,000,000 per annum. Copper, to the extent of £200,000 worth, is annually got from the copper pyrites used at the chemical works of the Tyne.

At Newcastle the railway system had its origin. Here, as might be expected, locomotive and engineering establishments are found upon a great scale. The ordnance works of sir William Armstrong at Elswick, the western part of Newcastle, are well known. Iron ship-building and various branches of engineering are extensively carried on upon the Tyne. Newcastle occupies an important position in the manufacture of soda, bleaching-powder, vitriol, and other chemical products, the annual value of which is about £1,300,000. There are decomposed in the district 200,000 tons of salt per annum. Earthenware is largely manufactured, window glass and flint glass have declined; impressed glass is largely manufactured, and plate-glass is made. Glass-staining has attained great perfection. The fire-brick trade is a new industry, which has attained gigantic proportions. About 80,000,000 fire-bricks are annually made, besides gas-retorts and sanitary pipes, which are sent all over the world. About 100,000 grindstones leave the Newcastle quarries annually. Portland and other cements are made to the extent of 11,000 tons in a year.

The river Tyne, from the sea to Newcastle, forms a natural dock for the accommodation of shipping. Three artificial docks have, however, been constructed at a cost of £1,700,000. Within the last 20 years improvements upon a large scale have been made by the river Tyne commission. The entrance to, and many parts of the river have been deepened by dredging. The depth of water on the bar has been increased from 6 to 33 ft. at low water. In 1880, 17,187 vessels of 5,967,042 tons entered the Tyne ports (Newcastle, with North and South Shields); and 17,990, of 6,299,507 tons, cleared.

Of the benevolent institutions established in Newcastle there are an infirmary, a dispensary, asylums for the blind, the deaf and dumb, and two orphanages. The literary and philosophical society, the society of antiquaries, the natural history society, the mechanics' institution, and the institution of mining engineers (to which has been recently added a large hall, as a memorial of Nicholas Wood, an engineer of celebrity) successfully cultivate their several fields of labor. A college of physical science, with four professorships (geology, experimental philosophy, chemistry, and mathematics) was established in 1871 in connection with the university of Durham; and there is also in Newcastle, associated with the same university, a college of medicine.

Lords Stowel, Eldon, and Collingwood, Mark Akenside, and Hutton, the mathematician, were natives of Newcastle. Intimately connected with it, though not born in it, were Thomas Bewick, the engraver; Robert Morrison, the Chinese scholar; and George and Robert Stephenson.

NEW CHRISTIANS, the name given to Jews who, 400 years ago, were compelled by the Spanish inquisition to embrace Christianity in order to escape torture and death. Many outwardly complied, while their secret attachment to their own religion was unchanged. But their persecutors, not satisfied with outward professions, and finding that Jewish services were still secretly held and Jewish customs rigidly maintained, resolved to seize the property of the obstinate ones even if they could not gain possession of their minds and hearts. They consequently ordered the arrest of several of the suspected converts and the confiscation of their goods, and denounced excommunication against all who favored or helped them. The Dominican convent at Seville, where the inquisition was held, being soon crowded with the prisoners. the tribunal was removed to the castle of Triana in the vicinity of the city. A second edict commanded every person, under penalty of excommunication for mortal sin, to inform against all who had relapsed into Judaism or were suspected of having done so. Sentences of death were soon pronounced. In that year about 300 New Christians were burned alive in Seville, 2,000 in other districts of Andalusia, and 17,000 were subjected to minor penalties. The property of all who were put to death was seized. The terror thus excited induced a large number of "New Christians" to flee into Portugal, where many Jews resided, and were treated with unusual justice. They had consequently become well educated, and filled, to some extent, the places of the expelled Moors as the authors, merchants, and physicians of the land. From their academy in Lisbon went out skillful mathematicians, grammarians, poets, theologians, botanists, and geographers. By steadfastness and united action, combined with native talent, they acquired great influence through the kingdom. But their superiority aroused popular jealousy, which at length produced an edict for their expulsion from Portugal. Soon the storm burst severely on the New Christians. In 1506 the plague raged violently in Lisbon and was aggravated by famine. During these combined calamities, while the people were offering up prayers for divine interposition, on Sunday, April 19, a brilliant light illuminated the figure of Christ. While many doubted the genuineness of the miracle one of the New Christians was bold enough to express publicly his unbelief. This arousing the populace, they seized the man and burned him at the stake. This one death was like a spark that kindles a conflagra-

tion. Within three days more than 2,000 persons were put to death; old men, women, and children were burned in the fire that raged in the public squares. The king was absent from Lisbon, but on hearing of the outrage, with righteous indignation, inflicted summary justice on the leaders of the massacre and on the magistrates who had failed to resist and stop it. Terrified by such calamities many both of the Jews and New Christians fled to Holland, where those of their nation enjoyed complete toleration. The king, anxious to keep all he could of such valuable citizens, commanded that children under the age of 14 should be retained and instructed in Christianity. This was a cruel order, but it doubtless impelled many Jews to profess Christianity. The Jewish historians affirm that the exodus of their people was complete both from Portugal and Spain; but Jewish physiognomy and family traditions alike prove that the movement was not universal. There certainly are many Jews in Portugal, and Jewish blood flows in the veins of many noble Roman Catholic families there. In modern times the descendants of New Christians have gradually lost all traces of their national faith. Family names alone point them out. But in remote provinces some traces of the ancient worship remain, especially in observing the great day of atonement. A few families abstain from eating bread during the passover, and many retain the sacred Jewish prayer.

NEWCHURCH, a very thriving t. of Lancashire, England, 19 m. n. from Manchester, in Rossendale, not far from the source of the Irwell. It has recently and rapidly risen to its present importance. There are numerous cotton and woolen manufactories, employing many operatives. Coal is also wrought in the neighborhood, and there are numerous large quarries of excellent freestone. Pop. about 4,000. The neighborhood is very populous, abounding in manufactories and other public works. Not much more than a m. to the w. of Newchurch, is Rawtenstall, a large village, now almost a town, and rapidly increasing.

NEW COLLEGE, Oxford. The college of St. Mary of Winchester, in Oxford, commonly called New College, was founded by William of Wykeham, bishop of Winchester and lord high chancellor, in 1386. The buildings are magnificent, and the gardens of great beauty. The most remarkable peculiarity of New College is its connection with Winchester school, another noble foundation of Wykeham. After the kin of the founder (to whom a preference was always given), the fellows were to be taken from Winchester. The late practice was that "two founders," as they were called, were put at the head of the roll for Winchester, and two others at the head of the roll for New College. In 1851, the college consisted of a warden and 70 fellows (elected in this way from Winchester), 10 chaplains, 3 clerks, and 16 choristers. By the ordinances under 17 and 18 Vict. c. 81, considerable changes were introduced, but the connection of the college with Winchester was in great measure preserved. The number of fellows was fixed at 30. Of these, 15 are open only to those who have been educated at Winchester, or who have been for 12 terms members of New College. The other 15 are open without restriction. The value of the fellowships is not to be more than £200 per annum, so long as their number is less than 40. There are also to be 30 scholarships, tenable for 5 years, of value not less than £80 per annum, inclusive of rooms, to be appointed by the warden and fellows of New College, by the election of boys receiving education at Winchester school. No conditions of birth are to be regarded in the election either of fellows or scholars. By a subsequent statute, the chaplains are made three in number, and from 8 to 10 choral scholars are added, to be upon an equality with the other scholars. This college presents to 40 benefices, and elects the warden of Winchester college.

NEWCOMB, Harvey, d.d., 1803–62; b. Vt., taught school for 8 years at Alfred, N. Y.; in 1823 became editor and publisher of the *Western Star*, Westfield, N. Y., and two years later was editor of the *Buffalo Patriot*. In 1830–31, he published the *Christian Herald* at Pittsburg, Penn., and for several years was engaged by the American Sunday school union in the preparation of books for the young. In 1840 he was licensed to preach, and in 1841 became pastor of the Congregational church at West Roxbury, Mass., and afterward of the churches at West Needham and Grantville. In 1849 he was for a year assistant editor of the Boston *Daily Traveller*, and in 1850–51 of the *New York Observer*. He spent several years after this in establishing Sunday schools in Brooklyn, N. Y., and supplied the Park st. mission church of that city, and in 1859 was installed pastor of the Congregational church in Hancock, Penn. He was a regular contributor to the *Boston Recorder* and other religious papers. Dr. Newcomb was a copious writer, being the author of 178 volumes, most of which were designed for children and youth, and had a large circulation. His largest work was *Cyclopedia of Missions*, a book of great value at the time.

NEWCOMB, Simon, ll.d.; b. Nova Scotia, 1835, came to the United States when a boy and here received his education, graduating at the Lawrence scientific school, Cambridge. From an early age he displayed remarkable proficiency in the higher mathematics and astronomy. For some years he taught school in Maryland, and in 1857 took part in the preparation of the *Nautical Almanac* for that year. He now began to attract the notice of the scientific world by his original investigations in astronomy, and in 1861 was appointed mathematical professor in the naval department and placed in charge of the naval observatory. In this position he made the contract and supervised the details of the purchase, construction, and mounting of the great telescope. In 1871, he was

secretary of the commission created by congress to arrange for the thorough scientific observation of the transit of Venus of Dec. 9, 1874. He was made a foreign associate of the English royal astronomical society in 1872, and two years later a gold medal was bestowed upon him by the same society for his tables of Neptune and Uranus. He is also a member of the French institute and of many American societies. In addition to his scientific attainments he has given attention to finance and political economy, and has delivered a course of lectures at Harvard college on kindred topics. Besides many scientific papers he has published *Popular Astronomy* (1880), *The A. B. C. of Finance* (1877), treatises on *Algebra*, 1881; *Geometry*, 1881; *Trigonometry*, 1882; etc.

NEWCOME, WILLIAM, D.D., 1729–1800; b. Bedfordshire, Eng.; educated at the grammar school and the university of Oxford, first a student at Pembroke college, and then a fellow and tutor of Hertford. He suddenly and rapidly rose to preferments. In 1765 he was appointed chaplain to the earl of Hertford, lord-lieut. of Ireland. In 1766 he was made bishop of Dromore, Ireland, and afterward of Ossory and Waterford, and in 1785, archbishop of Armagh. He faithfully performed his official duties, securing the respect of all parties. He was a diligent Biblical student, and published several valuable works, of which the first was, *The Harmony of the Gospels*, containing much important critical information. His other works are, *The Duration of our Lord's Ministry particularly considered, Observations on our Lord's Conduct as a Divine Instructor, and on the Excellence of His Moral Character;* a new version with critical remarks on the *Twelve Minor Prophets and Ezekiel.* His next work was, *A Historical View of the English Biblical Translations.* His last work, except an episcopal *Charge*, was, *An Attempt toward Revising our English Translation of the Greek Scriptures.* This was printed four years before his death, but not published till afterward.

NEWDIGATE, Sir ROGER, 1719–1806; b. England, patron of the Newdigate prizes at the university of Oxford, where he was educated at Westminster school and University college, and became distinguished as a classical scholar, of refined taste and brilliant attainments. He was a member of the house of commons for Middlesex 1751–80, representing the university of Oxford. He established the prizes for the best English verses on the arts of painting, sculpture, and architecture; having given to that institution Piranesi's works on architecture and antiquities, and the candelabra in the library founded by Dr. John Radcliffe.

NEW'EL, the central column or spindle formed by the ends of the steps of a circular staircase, and round which the stair winds. In turret-stairs, it is a plain roll; but in Elizabethan and old Scotch castles, there are frequent examples of handsome staircases of this kind with ornamental newels.

NEWELL, HARRIET (ATWOOD), 1793–1812; b. Mass. She was the first American woman who went as missionary to India. She sailed for India with her husband Samuel Newell, and Adoniram Judson and wife, Feb. 19, 1812. They were forbidden by the East India company to remain in Calcutta, and sailed Aug. 4 for the Isle of France. "Their passage was long and perilous. After having been driven about for a month in the bay of Bengal during which Mrs. Newell was sick of a fever, the ship put in to Coringa in distress. They left that port and early in November arrived at the place of their destination. About three weeks before their arrival, Mr. and Mrs. Newell committed to the deep the body of an infant daughter, five days old. From this time Mrs. Newell rapidly declined. Her disease, the consumption, baffled medical skill, and on Nov. 30 at Port Louis she was released from the toils and sorrows of this mortal life." A volume containing her life and writings was published by the American Sunday school union. A memoir of her by Dr. Woods has been widely circulated in several languages. She was much beloved at home, and many hearts were touched by the example of her early consecration. It may be that her death causing the knowledge of this example to be so widely diffused, and calling attention to the great missionary work, effected more for the heathen than a long life of labor would have done.

NEWELL, ROBERT HENRY, b. New York, 1836; engaged in business in his early life, but when about 21 entered upon the career of a journalist and literary man. He was connected with the *Mercury* of New York, 1858–63, and there first published the humorous articles in burlesque style under the pseudonym of Orpheus C. Kerr (office-seeker), on which his literary reputation mainly rests. Several volumes of these papers were published, and had a large sale. In 1863 Mr. Newell visited California, and has since published several volumes of prose and poetry. He has been a contributor to the *New York World* and editor of the *Hearth and Home.*

NEWELL, SAMUEL, 1785–1820; b. Mass.; graduated at Harvard college 1807. While engaged in the study of theology at Andover, he with five other students signed a paper addressed to the general association of Massachusetts (Congregational), expressing their desire to go as missionaries to the heathen and asking advice. It was this appeal that led to the formation of the American board. He married Harriet Atwood, and Feb. 19, 1812, sailed for Calcutta. Arriving there they were forbidden by the East India company to remain within their jurisdiction, and sailed for the Isle of France. After being driven about for a month in the bay of Bengal, the ship put in at Coringa in distress. Again sailing, their little daughter died, and was buried in the ocean. Soon after their

arrival Mrs. Newell also died and was buried on the island. Mr. Newell went to Ceylon, and afterward to Bombay, where he died of cholera. He was greatly endeared to the friends of missions by his devotedness and peculiarly amiable character. He wrote with Mr. Hall while at Andover, *The Conversion of the World, or Claims of Six Hundred Millions*, a work of thrilling interest which had great effect in churches in awakening a missionary spirit.

NEW ENGLAND, a collective name given to the six eastern states of the United States of America—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut—including an area of 65,000 sq. miles. The people, distinctively known as Yankees, and mostly descended from an English Puritan and Scottish ancestry, are engaged in commerce, fisheries, and manufactures, and are celebrated for industry and enterprise. This region was granted by James I. to the Plymouth company in 1606, under the title of North Virginia, and the coast was explored by capt. John Smith in 1614. See accounts of the several states.

NEW FOREST, the name of a district in Hampshire (q.v.), triangular in shape, and bounded on the w. by the river Avon, on the s. by the coast, and on the n.e. by a line running from the borders of Wiltshire along the Southampton water. Area about 64,000 acres. This triangle appears to have been a great wooded district from the earliest times, and its present name dates from the Norman conquest, when it was regularly afforested. Since that period it has remained a possession of the crown, subject to rights of "pannage," vert (greenwood), and turf-cutting, claimed by various estates in or near the forest. During the "pannage" month, which commences at the end of September, and lasts for six weeks, the borderers drive in herds of swine to feed on the mast in the forest, and this right they obtain by paying a small annual fee in the Stewarts court at Lyndhurst, which is considered the capital of the forest. Formerly this district was the haunt of numerous "squatters," but their huts are now rarely to be seen. Gipsies, however, still congregate here in considerable numbers. In 1854 a commission was appointed to examine the extent and nature of the rights of pannage, etc., claimed by the foresters and borderers, and in a large majority of cases the claims were confirmed. The principal trees in the forest are the oak and beech, with large patches of holly as underwood. The oaks have been much used as timber for the British navy. Tracts of exquisite woodland scenery are everywhere to be met with. The afforestation of this district by the conqueror, enforced by savagely severe forest laws, was regarded as an act of the greatest cruelty, and the violent deaths met by both of his sons, Richard and William Rufus—both of whom were killed by accidental arrow-wounds in the forest—were looked upon as special judgments of providence. A small breed of pony lives wild under its shelter.

NEWFOUNDLAND, an island and British colony of North America, not yet incorporated with the Dominion of Canada, lies at the mouth of the gulf of St. Lawrence, separated from Labrador on the n. by the straits of Belle Isle (about 12 m. broad), and extending in lat. from 46° 38′ to 51° 37′ n., and in long. from 52° 44′ to 59° 30′ west. In shape it resembles an equilateral triangle, of which cape Bauld on the n., cape Race on the s.e., and cape Ray on the s.w. form the angles. It is 370 m. in length, 290 m. in breadth, and has an area of 40,200 sq. miles. Pop. '69, 146,536; '81, 179,509.

The island, as seen from the sea, presents a wild and sterile appearance. Its surface is diversified by mountains, marshes, barrens, ponds, and lakes. The mountains in the Avalon peninsula (stretching s.e. from the main portion of the island, and connected with it by an isthmus of only about 3 m. in width) rise, in some cases, to 1400 ft. above sea-level; while both here and along the western shore the height of 1000 ft. is frequently reached. The number of the lakes and "ponds" (the latter name being used indiscriminately for a large or a small lake) is remarkable, and it has been estimated that about one-third of the whole surface is covered with fresh water. The "barrens" occupy the tops of hills. The coast line is everywhere deeply indented with bays and estuaries, many of which are spacious enough to contain the whole British navy. Of these inlets, the principal, beginning from the northern extremity of the island, are Hare, White, Notre Dame, Bonavista, Trinity, Conception, St. Mary's, Placentia, Fortune, St. George's, and St. John's bays. These bays vary in length from 25 to 70 m., are of great breadth, and are lined—as indeed the whole coast is—with excellent harbors. The rivers, none of which are navigable for any distance, communicate between the lakes of the interior and the shore, and are narrow and winding. The main streams are the Exploit, with its affluent the Great Rattling, and the Humber. Much of the soil is sterile and unproductive, although there is considerable cultivation along the sea-board of the settled districts, limited principally to the s.e. coast; exploration has shown that the best land and the best timber are in the interior. The great body of the people being employed either in the fisheries or in establishments connected with them, little attention used to be paid to the culture of the soil; but very considerable improvements in this respect have latterly been made by the enterprising islanders. In 1845 the only crops raised were oats and hay; but within recent years large supplies of grain, vegetable, and garden seeds have been imported; and now about 600,000 bushels of potatoes are produced annually, and turnips, hay, carrots, clover, barley, and oats are cultivated with success. The island possesses some minerals, among which are marble, limestone, gypsum, roofing-

slate, and coal—the last found only in small quantities; also copper, nickel, lead, and iron. One rich copper mine is worked, though mining is still in its infancy here. Trees, of which the chief are pine and fir, birch, and willow, thrive only in the more fertile districts.

The fisheries are of two kinds—the "shore fishery" and the "bank fishery;" the former comprises the shores and bays of Newfoundland; the latter comprises a great tract known as the "banks" of Newfoundland, from 500 to 600 m. in length, and about 200 m. in breadth. The banks form the greatest submarine plateau known; the depth of the water is from 20 to 108 fathoms, and the most productive "ground" is said to extend between lat. 42° and 46° north. Great variety of valuable fish is found in the waters around the colony, as the cod, salmon, herring, etc. The principal articles of export are fish—comprising dry cod, herring, and salmon—and cod-oil. Of dry cod, 970,176 quintals, value £810,943, were exported in 1870; 3,593 tuns of unrefined cod-oil, value £107,813; 404 of refined cod-oil, value £21,068; 4,982 of seal-oil, value £176,472; and 265,189 seal-skins, value £55,248. The imports are chiefly provisions, as bread, butter, tea, etc.—cordage and cables, and manufactured goods. The imports and exports for 1883 amounted in value to £1,197,962 and £1,175,000 respectively. The revenue of Newfoundland in 1883 was £283,933; the expenditure, £257,171. In 1873 the total tonnage of vessels that entered and cleared the ports was 412,024. Newfoundland possessed itself 1301 vessels of 68,185 tons.

The seal affords one of the most important fishing interests of Newfoundland. This industry may commence any day from Feb. 25th to March 5th, according to the winds—a n.e. wind blocking up the coast with ice, which the first strong westerly wind clears away. At the beginning of the present century, the seal-fishing was carried on with vessels of from 30 to 40 tons, manned by 8 or 10 men. Vessels of from 70 to 180 tons, manned by from 25 to 90 men, were substituted for these, the most suitable being vessels of from 120 to 140 tons. About 1866, steamers were introduced into the seal-fishing, and they have proved very serviceable. The total value of this fishery in 1880 was £57,000; in 1881 it was £74,000. In proportion to the population of Newfoundland, its religious institutions are ample, while education is within reach of all classes, government grants to the district school being liberal.

In 1881, arrangements were completed for laying the first railway, from St. Johns to Hall Bay, a distance of over 300 m. There are no roads across the island; they are confined chiefly to the south-eastern and south-western sea-board. There is weekly communication for nine months in the year between Newfoundland and Europe. In the colony and connected with it, 400 m. of lines of telegraph have been constructed, and the Atlantic telegraph has its western terminus on this island.

The early history of Newfoundland is involved in obscurity. It was discovered, June 24, 1497, in the reign of Henry VII., by John Cabot; and the event is noticed by the following entry in the accounts of the privy-purse expenditure: "1497, August 10, To hym that found the New Isle, £10." It was visited by the Portuguese navigator. Gaspar de Cortereal, in 1500; and within two years after that time, regular fisheries had been established on its shores by the Portuguese, Biscayans, and French. In 1578, 400 vessels, of which 50 were English, were engaged in the fishery. Sir Humphrey Gilbert, with his ill-fated expedition, arrived in St. John's harbor, August 1583, and formally took possession of the island in the name of queen Elizabeth. In the return voyage, the expedition was scattered by a storm, and the commander lost. In 1621, sir George Calvert (afterward lord Baltimore) settled in the great peninsula in the s.e., and named it the *Province of Avalon*. The history of the island during the 17th and part of the 18th centuries, is little more than a record of rivalries and feuds between the English and French fishermen; but by the treaty of Utrecht (1713), the island was ceded wholly to England; the French, however, retaining the privilege of fishing and drying their fish on certain portions of the coast. A governor was appointed in 1728. The present form of government, established in 1855, consists of the governor, a legislative council (appointed by the crown), and a general assembly (elected by the people). The coast of Labrador on the mainland, and the island of Anticosti, have been included, since 1809, within the jurisdiction of the governor of Newfoundland. Cap. St. John's. Pop.'83, 22,553.

NEWFOUNDLAND DOG, one of the most sagacious and esteemed of the large kinds of dog. It is said to have been originally derived from Newfoundland, where it is used chiefly as a beast of draught, to convey light loads of wood or provisions, on sledges, over rugged tracks. Multitudes of these dogs, in St. John's and elsewhere, are left to shift for themselves during the fishing season; and are again called to service when required by their masters. There are several varieties of Newfoundland dogs, particularly a smooth breed, with rather small head, white and spotted with black, which seems now to be extinct; a very large breed, with broad muzzle, head raised, noble expression, waved or curly hair, very thick and bushy curled tail, black and white color; and a smaller almost black breed. Some of the breeds seem to be crossed with hounds and other dogs. The Newfoundland dog is remarkable for memory, and for patience and forbearance of temper. It is, however, apt to become irascible in confinement, and will then bite even its master. Some of the most interesting anecdotes of the affection and

sagacity of the dog, relate to the Newfoundland dog. No dog excels it as a water-dog. Its paws are half-webbed. Its power of endurance in swimming is very great.

NEWGATE, a celebrated London prison, stands at the western extremity of Newgate street. opposite the Old Bailey. It is the chief criminal prison for the city and county. The exterior presents high dark stone walls, without windows, and with entrances from the side next the Old Bailey, in front of which public executions take place. The earliest prison here was in the portal of the *new gate* of the city, as early as 1218; and hence the name. About two centuries afterward, it was rebuilt by the executors of sir Richard Whittington, whose statue with a cat stood in a niche, till its destruction by the great fire of London in 1666. Shortly after, it was reconstructed, from which time, till 1780, the date of the erection of the present edifice, its condition was, in a sanitary point of view, horrible. Mr. Akerman, one of the keepers, in his evidence before the house of commons in 1770, stated, as a proof of this, that in the spring of 1750 the jail distemper, spreading to the adjoining sessions house, caused the death of "two of the judges, the lord mayor, and several of the jury and others, to the number of 60 persons and upwards." The place, however, is now kept in the cleanest possible condition. The cells for condemned prisoners are at the n.e. corner, next to Newgate street. The *Newgate Calendar* contains biographical notices of the most notorious murderers, burglars, thieves, and forgers who have been confined within its walls.

NEW GRANADA, since Sept. 1861, has been officially styled *The United States of Colombia.* This federative republic was formed at the convention of Bogota, at the date specified, and consists of nine "states," Panama, Santander, Cauca, Boyaca, Cundinamarca, Antioquia, Tolima, Bolivar, Magdalena. It is bounded on the n. by the Caribbean sea ; on the w. by Costa Rica, a republic of Central America, and by the Pacific ; on the s. by Ecuador and Brazil; and on the e. by Venezuela. Area, 513,783 sq.m.; pop. '70, 2,894,992, of whom nearly a half are of European descent. By a constitution dated May 1863, the executive authority is vested in a president elected for two years, while the legislative power rests with a senate and a house of representatives. The federal army of this republic consists of 3,000 men on the peace footing, but in a time of war each state is bound to furnish a contingent of one in a hundred of its population. The revenue in 1881 was $5,917,000, and the expenditure $9,529,530. The public debt in the same year was close on $20,000,000. The total imports in 1880–81 had a value of $12,071,500 ; the exports $15,837,000. Besides the railway across the isthmus of Panama, there are 2 other short lines ; and de Lesseps' canal passes through the republic's territory.

The country is intersected by three great ranges of the Andes, which spread out like the rays of an open hand from the plateau of Pasto and Tuquerrez in the s. (14,000 ft. high), and are known as the western, central, and eastern Cordillera. Between these chains lie the long and beautiful valleys of the Cauca and the Magdalena. The central Cordillera is the highest chain, rising in Nevada de Tolima to a height of 18,020 ft., and and from one of its peaks, near the frontiers of Ecuador, called the Paramo de las Papas, descend the two principal rivers of New Granada, the Magdalena and its tributary the Cauca, flowing n. in the Caribbean sea, besides several affluents of the Amazon in the e. and one or two streams flowing westward into the Pacific. The eastern Cordillera is by far the largest chain, and consists of a series of vast table-lands, cool and healthy, where the white race flourishes as vigorously as in Europe. This temperate region is the most densely peopled portion of the confederation, being, in some places, at the rate of 2,600 to the square league, Bogota (q.v,) the present capital, is situated on one of these plateaux, at an elevation of 8,694 feet. Eastward from this Cordillera stretch enormous plains as far as the Orinoco, the greater part of which belongs to New Granada, and through which flow the Meta, the Guaviare, and other tributaries of the Orinoco. The geology of the country is very extraordinary. "Everywhere," we are told, "are found traces of stupendous cataclysms, and a disarrangement and intermixture of primitive and sedimentary rock, which seem to put all classification at defiance." In the course of one day's journey, the traveler may experience in this country all the climates of the world. Perpetual snow covers the summits of the Cordilleras; while the rich vegetation of the tropics covers the valleys. With its great variety of levels and climates, New Granada yields naturally an equally great variety of productions: cattle, horses, wheat and other European grains, maize, tobacco, coffee, plantains, cotton, cacao, sugar, cedar, mahogany, cinchona bark, ipecacuahna, gold, silver, copper, iron, and lead, coal, emeralds, pearls, and rock-salt.

By the constitution, complete toleration in matters of religion and worship, the freedom of the press, a system of parish schools, with gratuitous primary education, and many other important helps to civilization and liberty have been established. The inhabitants rank first among the South Americans in point of literary and scientific culture. There are at present about 1000 public schools in the country, many seminaries and colleges for higher and professional instruction; there are printing establishments, periodicals, and numerous literary, scientific, and benevolent institutions.

The chief aborigines of the country, called *Chibchas* or *Muyscas*, held a high rank among the semi-civilized nations of the New World. They are said to have been frugal and industrious, with a well-organized government and a very passable religion—for heathens. They were conquered by Ximenes de Quesado (1536–37), and their descendants

are now "Christians," and speak the Spanish language. Several of the other tribes still maintain a savage mode of life; and some, as the Mesayos, are even said to be cannibals. In 1718, New Granada was erected into a vice-royalty by Spain. In 1819, it became independent, and then joined with Ecuador and Venezuela to form the republic of Colombia; but the union was dissolved in 1829–30, and New Granada was organized as a separate republic in 1832. After several changes in the constitution (in 1843, 1851, 1853), a complete fundamental change was made in 1858, by which the separate "provinces" were changed into "states," associated under a federal government like the "United States" of North America, but self-governing in all internal affairs. In 1860, another revolution broke out, and for more than two years, the country was devastated by civil war. Finally, on Sept. 29, 1861, a convention was concluded between the conservatives or federalists, and the "liberals," which put an end to the strife. As the victory lay with the latter, certain changes have again been made in the constitution, and the country is now, as stated above, officially designated the "United States of Colombia." The first president under the new form of the constitution commenced his term of office on April 1, 1864.

NEW GUI'NEA. See PAPUA.

NEWHALL, FALES HENRY, D.D., b. Mass. 1827: studied at Wesleyan university, Middletown, Conn., (Methodist Episcopal), and graduating in 1846, taught school 7 years, and in 1853 entered the ministry. In 1863 he accepted the chair of rhetoric and English literature in Wesleyan university, which he held until 1871. In 1867 he went abroad for a year, and 1873 was elected president of the Wesleyan university at Delaware, Ohio.

NEW HAMPSHIRE, one of the original thirteen United States of America, in lat. 42° 41′—45° 11′ n., long. 70° 40′—72° 28′ w., is 176 m. long, and on an average 45 m. wide, having an area of 9,280 sq.m., or 5,939,200 acres. It is bounded n. by Canada, e. by Maine and the Atlantic ocean, s. by Massachusetts, and w. by Vermont, from which it is separated by the Connecticut river. It has ten counties; the chief towns are Manchester, Portsmouth, Dover, Nashua, Keene, and Concord, the capital. The population, except the recent influx of Irish in the manufacturing towns, is almost entirely descended from the original English and Scottish settlers. It has 18 m. of sea-coast, and one seaport, Portsmouth, at the mouth of the Piscataqua river, with a deep and commodious harbor. Its other chief rivers are the Connecticut and the Merrimack. It is a state of mountains and lakes, much visited by tourists, and called "The Granite State" and "The Switzerland of America." The White mountains lie in the n. central region. Their highest summits are Mt. Washington, 6,285 ft.; and Mt. Lafayette, 5,500 ft. A notch in the White mountains, 2 m. long, and in the narrowest part only 22 ft. wide, affords passage to a road and mountain stream, and is much visited. The lakes and rivers of New Hampshire occupy in all about 110,000 acres. Lake Winnepiseogee is 25 m. long by 1 to 10 m. wide, with 360 islands, from a few yards to many acres in area, mostly covered with evergreens. The rocky strata consist of metamorphic rock, mica, and talcose slates, quartz, granular limestones, granite, gneiss, and contain magnetic and specular iron ores, beryls, tourmalins, mica, graphite, and steatite or soap-stone. The soil, except in the fertile valleys, is better adapted to pasturage than culture. The winters are long and cold, so that in the mountainous regions mercury sometimes freezes. In the forests are oak, maple, pine, hemlock, spruce, etc. The chief agricultural products are maize, rye, oats, apples, potatoes, and products of the dairy. Numerous water-falls give motive power to many cotton-factories, woolen, iron, and paper-mills, etc. The state has 915 m. of railway, 45 national and 65 savings banks, a college (at Dartmouth), 700 churches, 50 newspapers, an excellent system of free school, and government and judiciary similar to all the American states. New Hampshire was settled in 1623 by colonists from Hampshire in England, who suffered during the colonial period from Indian wars and depredations. The state was organized in 1776. It has furnished a a multitude of emigrants to the newer and more fertile western states. Pop. '10, 214,360; '40, 284,574; '70, 318,300.

NEW HAMPSHIRE (*ante*), was first visited by capt. John Smith, the English navigator, in 1614, and next by a capt. John Mason and sir Ferdinand Gorges. In some of the earliest histories it is called Laconia, and in others capt. John Mason's Patent, and Pascataqua. The first settlements were made at Dover and Portsmouth in 1623, and 12 years later another was formed at Exeter; but the settlers were unable to defend themselves against the Indians, and in 1641 all the settlements in the state united with the colony of Massachusetts. In 1679, however, Charles II. made it a separate royal province, with a president and council appointed by the crown, and an assembly chosen by the people. Then again from 1689 to 1692 it reunited with Massachusetts, which relation it continued 49 years before becoming for the third time an independent province. The settlements were gradually extended further w. than the original patent prescribed, and it was believed until 1764 that the territory at present included in Vermont formed part of the grant, a mistake that led to a vexatious controversy which lasted many years. In 1776 the state declared its independence, and a temporary government was established that continued during the revolutionary war, in which its people were among the most active and noted participators. The state was also represented in the continental con-

gress, and ratified the constitution of the United States by a vote of 57 to 46. At a convention in Oct., 1783, a constitution was prepared similar to that of Massachusetts, and this as altered slightly six years afterwards is still the constitution of the state. In 1807 Concord was chosen as the permanent capital. The total land area is 9,305 sq.m.

Previous to 1860 large gains in the state's growth were reported in every census; but by the census of that year it was found that there was a decrease of 2.38 per cent. in the population, and for many years its agricultural interests have been declining. The soil never was very fertile, and much of the land which was once productive has become worn out by long use. This fact, in connection with the severity of the climate, has caused many of the younger generation to seek new advantages in the west. In 1880, of the total population 10 years of age and over (346,991) there were engaged in all occupations 142,468, which total was divided as follows: Agriculture, 44,490; manufacture, mechanical, and mining industries, 58,037; trade, 3,179; clergymen, 646; lawyers, 382; physicians, 610; laborers, 10,651; domestic servants, 7,538. The number of acres in farms was 3,721,173, of which 2,308,112 acres were improved. The average size was 116 acres. The value of the farms was estimated at $75,834,389, and of the farming implements and machinery, $3,069,240. Among its productions in 1880 were: wool, 1,060,589 lbs.; butter, 7,247,272 lbs.; cheese, 807,076 lbs.; hops, 23,955 lbs. Among productions in 1883: rye, 29,767 bush.; barley, 74,800 bush.; buckwheat, 74,290 bush.; potatoes, 3,489,285 bush.; tobacco, 145,978 lbs.; hay, 597,499 tons. In 1884: corn, 1,286,000 bush.; wheat, 170,700 bush.; oats, 993,000 bush. Large quantities of maple sugar and maple molasses are also produced.

The value of all kinds of live stock in the state during the year 1883 was estimated at $13,022,717. It included 49,385 horses, 95,157 milch cows, 141,784 other cattle, 209,686 sheep, and 55,056 swine. It is in manufactures rather than agriculture that the state ranks high. The busy cities of Manchester, Dover, and Nashua, together with the numerous smaller towns active with manufacturing industry, make it among the first in the union in this respect. Cotton and woolen goods, boots and shoes, machinery, and other iron and metallic wares, are the leading articles of manufacture; but paper, carriages, furniture, hosiery, leather, lumber, wooden-ware, and a large variety of other goods are extensively produced. In 1880 the total number of manufacturing establishments was 3,181, employing 48,831 hands, and using a capital of $51,112,263. The value of the material used was $43,552,462, and of the products, $73,978,028. Of this amount the manufacture of cotton goods furnished the largest single item, $18,226,573; the woolen and worsted goods produced were valued at $10,808,071; lumber, $3,842,012; boots and shoes, $7,230,804; mixed textiles, $2,703,281; iron and steel, $807,340; leather, tanned, $2,315,616; curried, $2,161,734. Machinery, paper, wagons, carriages and cars are also largely manufactured; flouring mill products, $2,542,784; hosiery and knit goods, $2,362,779. As to the state's foreign commerce, it is usually very small. Portsmouth is its only port of entry; and in 1874 the value of imported goods received there amounted to about $41,000. The exports were not $200 in value. The number of American vessels that entered and cleared from the port in '84 was 66, with a tonnage of 10,574; the number of steam vessels was 7, with a tonnage of 378. The number of railroads, with their branches lying wholly or partly in New Hampshire in 1883 was 35. The chief ones were the Eastern; Boston and Maine; Ashuelot; Boston, Concord and Montreal; Fitchburg; Nashua and Lowell; Wilton; Cheshire; Grand Trunk; Northern; Concord; Manchester and North Weare; Concord and Portsmouth; Dover and Winnipesaukee; Portsmouth; Great Falls and Conway; Manchester and Lawrence; Concord and Claremont; Sullivan County; Worcester and Nashua; Mt. Washington; Suncook Valley; Portland and Rochester; Monadnock, Portland and Ogdensburg; Wolfborough; Atlantic and St. Lawrence.

The number of national banks in operation in the state at the beginning of the year 1885 was 48. Their capital amounted to $6,105,000; individual deposits, $4,961,313; outstanding circulation $5,173,915. There were 1882, one state bank with $50,000 capital, and 65 savings-banks, which had deposits to the amount of $36,630,994. The charters of all savings-banks incorporated for a term of years are perpetual. Nearly one-fourth of the inhabitants of the state had deposits in the savings-banks in 1881, the amount averaging between 90 and 100 dollars for every inhabitant. The fire-risks written in the state in 1882 amounted to $69,987,572; the deposits to $11,950,766; 10 telegraph companies have lines in the state.

In 1884 the assessed valuation of real and personal property in New Hampshire was reported by the assessors of the several cities and towns to be $213,897,132. The state tax is divided among the cities and towns according to an apportionment made every four years, based on the assessed valuation of the taxable property. Railroads are taxed separately, the judges of the superior court determining the present value of the capital and assessing in proportion to the taxation of other property. The state income for the fiscal year ending June 1, 1884, was $506,933; the expenditures for the same period amounted to $505,391; amount of funded debt, $3,290,000; unfunded, $100. The collections of internal revenue for 1883 amounted to $352,998; the number of patents issued to residents of the state was 139.

The public school system of the state, like that of the other New England states, is carefully watched. The general supervision is vested in a state superintendent, and the

several towns annually choose committees, among whom (Laws, '78, '79, '81) women may vote in school meetings, and are also eligible to all school offices. A compulsory educational law was passed in 1871, requiring all children between 8 and 14 years of age to attend school at least 12 weeks of every year. In 1882 there were 2,021 district and 2,644 public schools in the state, of which 481 were graded schools. The number of children in attendance was 64,349; and there were only 3,804 children between the ages of 5 and 15 who attended no school. The whole number of teachers was 3,594, of whom 477 were men and 3,117 women. Besides the common public schools, there is a state normal school at Plymouth with 4 teachers, and also 53 academies, seminaries, and private schools, which have about 140 teachers. These include some of the oldest and most noted schools in the country, such as Phillips academy at Exeter, founded in 1781; St. Paul's school at Concord; the Kimball Union academy at Meriden, and the New Hampton literary institute at New Hampton. At Hanover, Dartmouth college is located, which, besides the college proper, comprises the Chandler scientific school, the Thayer school of civil engineering, a medical school, and the New Hampshire college of agriculture and mechanic arts. (See DARTMOUTH COLLEGE.)

The total amount of receipts in 1881–82, for public school purposes was $584,528; expenses, $578,702; estimated value of school property, $2,341,679. The deaf and dumb and blind are instructed in the schools of other states. There is a state industrial school at Manchester. Orphan and dependent children are cared for in institutions at Concord, Franklin, and Portsmouth.

The largest library in the state is the one belonging to Dartmouth college; others are the Concord, State, city, Y. M. C. A., and N. H. historical society. Manchester and Portsmouth.

The number of newspapers and periodicals printed in 1880 was about 87, there being 10 dailies, 66 weeklies, and 7 monthlies.

Among the denominations are the Baptist, Christian, Congregational, Freewill Baptist, Friends, Methodist, Presbyterian, Protestant Episcopal, Roman Catholic, Second Advent, Shaker, Union, Unitarian, Universalist. The four leading denominations, in point of numbers, in 1880, were the Roman Catholic, Congregational, Methodist, and Freewill Baptist. The predominance of the first due chiefly to the large number of foreigners who work in the mills and factories, or who, as elsewhere in New England, have settled on the stony hillside farms deserted by the natives who have emigrated to the west.

The constitution of New Hampshire extends the right of suffrage to every male citizen who is 21 years of age and who has resided in one town six months previous to election, excepting paupers and persons who are excused from paying taxes. Only Protestants, according to the constitution, are eligible to the office of governor, or are eligible as senators or representatives. The executive department consists of a governor, five councilors, secretary of state, treasurer, commissary-general, and superintendent of public instruction, who are elected annually. All the judicial officers, such as the attorney-general, solicitor, sheriffs, coroners, registers of probate, and general field officers of the militia, are appointed by the governor. The judicial power is vested in a superior court of judicature and a circuit court, probate court, police courts, and justices of the peace. The legislature, styled the general court, comprises a senate of 24 members and a very large house of representatives. The state is represented in congress by two senators and two representatives. The electoral votes have been cost as follows: 1788, Washington and Adams, 5; 1792, Washington and Adams, 6; 1796, Adams and Ellsworth, 6; 1800, Adams and Pinckney, 6; 1804, Jefferson and Clinton, 7; 1808, Pinckney and King, 7; 1812, Clinton and Ingersoll, 8; 1816, Monroe and Tompkins, 8; 1820, Monroe and Tompkins, 7; 1820, Adams and Rush, 1; 1824, Adams (for president), 8; Calhoun (vice-p.), 7; Jackson (vice-p.), 1; 1828, Adams and Rush, 8; 1832, Jackson and Van Buren, 7; 1836, Van Buren and Johnson, 7; 1840, Van Buren and Johnson, 7; 1844, Polk and Dallas, 6; 1848, Cass and Butler, 6; 1852, Pierce and King, 5; 1856, Fremont and Dayton, 5; 1860, Lincoln and Hamlin, 5; 1864, Lincoln and Johnson, 5; 1868, Grant and Colfax, 5; 1872, Grant and Wilson, 5; 1876, Hayes and Wheeler, 5; 1880, Garfield and Arthur, 5; Blaine and Logan, 4.

NEW HANOVER, a co., in s. North Carolina, having the Atlantic ocean for its s. and s.e. boundary, the broad cape Fear river and its affluent the Black river for its w., intersected by the n.e. branch of the former river; about 850 sq.m., pop. '80, 21,387—20,834 of American birth, 13,224 colored. It is intersected by the Wilmington and Weldon, and the Wilmington, Columbia, and Augusta railroads, forming a junction at Wilmington, which is the e. terminus of the Carolina Central railroad. Its surface is generally level and largely covered with pine forests, sinking into low swampy land in some sections. Its soil is sandy and adapted to the cultivation of the vine. Stock is raised; also corn, sweet potatoes, rice, and wool. Its leading industries are the manufacture of carriages and wagons, railroad cars, cooperage, fertilizers, iron castings, and machinery. It has flour and saw mills; and lumber, tar, and turpentine, are the chief commodities. It has cotton factories, rice mills, and turpentine distilleries. Steamboats ply between its chief town and the ports of Baltimore and Charleston, and vessels stop here to recruit their stores. County seat, Wilmington.

NEW HARMONY, a village of Indiana, first settled in 1815 by a German community of religious socialists, called Harmonists, under the leadership of George Rapp. In 1824,

the village and domain was purchased by Robert Owen, for an experimental community on his system. After the speedy failure of this society, the property was bought by William Maclure for a school of industry. It is now a flourishing western village of, '80, 1,095 inhabitants. .

NEW HAVEN, a co. in s.w. Connecticut, bounded s. by Long Island sound, and w. and s.w. by the Housatonic river, which separates it from Fairfield co.; about 620 sq.m. Pop. '80, 156,526—119,218 of American birth, 1591 colored. Naugatuck river is the only stream of any size, though several small creeks and rivers empty into the sound; the principal railroads are the New York, New Haven, Hartford, and Springfield, with its shore line branch to New London; the New Haven and Northampton; the Boston and New York air line, and the Naugatuck. The surface is uneven; the soil sandy in places, and only moderately fertile; covered in part with forests of maple, oak, beech, elm, and hickory; the staples are potatoes, Indian corn, oats, tobacco, and dairy product. The manufactures are very extensive and profitable, especially at Waterbury, Meriden, Wallingford, and New Haven. Carriages, clocks, plated ware, hardware, machinery, bricks, pens, tools, cutlery, and rubber articles, being among the chief products. A proposition is now (1881) being agitated to set off the northern part, including Waterbury and some small towns, to form a new county. County seat, New Haven.

NEW HAVEN, the chief c. and seaport of Connecticut, U. S., at the head of a bay, 4 m. from Long Island sound, 76 m. e.n.e. of New York. Its broad streets are shaded with elms, and the public squares, parks, and gardens, with its handsome public and private edifices, make it one of the most beautiful of American cities. It is the seat of Yale college (q.v.), which has more than a dozen large buildings and a gothic library, 150 ft. long. There are a handsome custom-house, state-house, hospital, 51 churches, academies and schools, 9 banks, 5 daily papers, and 3 ornamental cemeteries. There are large manufactories of carriages, clocks, and leather, iron and india-rubber works. It has railway and steamboat connection with New York, etc. Pop. '70, 50,840.

NEW HAVEN (*ante*) is situated on a sandy plain inclosed between the Quinipiac and Mill rivers on the e. and the West river on the w.; East Rock and West Rock on either side are of volcanic formation, about 450 ft. in height, and front the city with their precipitous faces. The railroads which center here are the New York, New Haven, and Hartford—running w. and n. and with a branch, the Shore line, running to the e.; the New Haven and Northampton, the New York and Boston air line, and the Derby and New Haven; pop. '80, 62,882. The harbor is large but not of great depth; improvement is now being made by extensive dredging. The shipping business is considerable, but not as great, proportionately, as in former years, when a large trade was carried on with the West Indies. Two lines of steamboats run to New York, four boats leaving each port daily. The city is distant from Hartford, the capital, 36 m., from New London about 50 m., and from New York 76 miles.

New Haven was founded in 1638 by a Puritan colony under the rev. John Davenport and Theophilus Eaton, and with the adjoining towns of Guilford, Milford, Stamford, and Branford, constituted an independent colony until 1662, when it was brought under the same charter with Connecticut. Hartford and New Haven were then made joint capitals and continued so until 1873, when the constitution of the state was amended and Hartford became sole capital. There are both town and city governments, the latter under a special charter; the villages of Westville and Fair Haven are included in the city limits. There are ten wards, each sending two aldermen and three councilmen to the common council, who are elected annually, as is the mayor. The fire, police, and street departments, are controlled by boards of commissioners, and are very efficient. Taxes are moderate and, including that for the school fund, amount to about 16 mills on the dollar. The city has long been called "Elm City," from the great number of ancient elms which adorn its streets and parks, most of which were planted at the end of the last and beginning of this century. The public square or "green" lies in the center of the city as originally laid out, and is surrounded by a double row of elms, which also border Temple street passing through the green, and that part of the college grounds adjoining. In this park are three churches; one, the oldest in the city, has a crypt containing the tombs of many of the old heads of families of the state. Here also is the old state capital, in decay of late years. Behind Center church are the tombs of the "regicides," Goffe, Whalley and Dixwell, and upon the slope of West Rock may be seen a cave, or rather shelter among boulders, said to have been occupied by them as a place of concealment, and bearing the inscription "Opposition to tyrants is obedience to God." Among the principal streets are Chapel, Church, and State, the business thoroughfares, and Hillhouse avenue, Prospect, West Chapel, and Dwight streets, where are many of the best residences and handsome grounds. The town is remarkable for the abundance of trees and the absence of all crowding of residences, even in the center of the city. The most noteworthy public buildings are the post-office, city hall, and county court-house the finest buildings of the city, the police building, the public high school, the Peabody museum, and other of the college buildings. See YALE COLLEGE. There are nearly 50 churches; among the finest are Trinity and St. Paul's Episcopal, St. Mary's Roman Catholic, Church of the Redeemer, Congregational, and the Baptist church on Chapel street. Besides the various departments of the college, there are several academies for

boys and young ladies, Hopkins grammar school being the best known. There is a fine high school and a good common school system. For many years New Haven has been largely engaged in the manufacture of clocks and carriages, and there are many factories for making the latter. Winchester's rifle, pistol, and cartridge factory; Candee's rubber works (the second largest in the world); Sargent's factory of domestic hardware, etc.; and Wheeler's iron works are among the largest concerns in the city. Among many other articles produced are pianos, organs, pins, fish-hooks, matches, paper boxes, all kinds of iron and brass ware, machinery, corsets, skirts, paper, and shoes. The city is the center of a large retail trade with the surrounding country, and through it passes nearly all the coal and freight of the New England states. The city debt is not burdensome, and consists mainly in bonds for the expense of the excellent sewerage system, and in aid of the Derby railroad. There are five daily newspapers, nine weeklies, several monthly magazines, and a quarterly published in the city. The college, which of late has assumed the features, though not the name, of a university, has for over a hundred years been a center for much of the social life of the community, but this influence is now less dominant, as the city has greatly enlarged.

NEW HEBRIDES, a group of islands in the Pacific ocean, to the n.e. of New Caledonia, and to the w. of the Fijis, in s. lat. between 14° and 20°, and in e. long. between 167° and 170°. Total area estimated at 3,500 sq. miles. They are regarded as the most easterly point of the western division of Polynesia. The group embraces Espiritu Santo (65 m. long by 20 broad), Mallicollo (60 m. long by 28 broad), Vati Ambrym, Annatom, Erromango, and Tanna, with an active volcano. Aurora, one of the most fertile of the group, disappeared in 1871, leaving no trace. Most of the group are hilly and well wooded, some even mountainous. The most important woods are ebony and sandal; the principal edible products, yams, bananas, cucumbers, cocoa-nuts, and sweet potatoes; and the only animal of consequence, a diminutive species of hog, which, when full-grown, is no bigger than a rabbit. The inhabitants, who number about 200,000, are fierce, but are excessively dirty and unintelligent. Erromango is a well-known name in missionary history, being the scene of the barbarous massacre of the rev. John Williams —generally called the martyr of Erromango.

NEW HOLLAND, the former name for Australia (q.v.).

NEW INN HALL, Oxford. This hall, with certain gardens adjoining, was presented to the warden and fellows of New college, by William of Wykeham in 1392. The first principal on record occurs in 1438. During the civil war it was used as a mint for Charles I. It was restored to the purposes of instruction by Dr. Cramer, the late principal, who erected a handsome building for the use of the students.

NEW IRELAND, a long narrow island in the Pacific ocean, lying to the n.e. of New Britain (q.v.), from which it is separated by St. George's channel; lat. 2° 40′ to 4° 52′ s., long. 150° 30′ to 152° 50′ east. Length about 200 m.; average breadth, 12 miles. The hills rise to a height of from 1500 to 2,000 ft., and are richly wooded. The principal trees are cocoas on the coast, and in the interior, forests of areca-palm. The chief products are sugar-cane, bananas, yams, cocoa-nuts. Dogs, pigs, and turtles abound. The natives are apparently of the same race as the inhabitants of Australia; but our information about them is extremely scanty.

NEW JERSEY, one of the original thirteen United States, in lat. 38° 55′ to 41° 21′ n., and long. 73° 58′ to 75° 29′ w., 168 m. long, with a breadth which varies from 59 to 32 m., containing an area of 8,320 sq.m., or 5,324,800 acres; bounded n. by New York, e. by the Hudson river and the Atlantic ocean, s. by the ocean and Delaware bay, and w. by Delaware bay and river, which separate it from Delaware and Pennsylvania. It has 21 counties. The chief towns are Trenton (the capital), Newark, Paterson, Jersey City, Elizabeth, Camden, Hoboken. Its coast line is 120 m., or, including bays, 540 miles. Besides its bordering rivers, the Hudson and Delaware, its principal streams are the Passaic, Hackensack, and Raritan. The northern portion of the state is hilly and mountainous. The Palisades, a wall of perpendicular trap-rocks, from 200 to 500 ft. high, form the western bank of the Hudson river for 15 m., and one of the grandest features of its scenery. The central portion of the state is a rolling country, and the southern and eastern portion a sandy plain declining to the sea. Five geological belts cross the state, containing a sandy pine plain with bog iron ore, shelly marls used for manure, glass sand, green-sand or marl, plastic clay, used in making fire-bricks, metamorphic rocks, argillaceous red sandstone, copper ores, gneiss with specular and magnetic iron ores, red oxide of zinc, and Franklinite iron. Among the most attractive features in the scenery are the falls of the Passaic, the Delaware water gap, and Schooley's mountain. Atlantic city, a bathing-place on the sea-coast, connected by railway with Philadelphia, is a fashionable summer resort. The climate is mild, the soil n. of the pine plains fertile, the country healthy, except the malarious river-bottoms. The agricultural products of the state are wheat, maize, oats, common and sweet potatoes, apples, peaches, plums, grapes, melons, and garden vegetables for the great neighboring markets of New York and Philadelphia. There are cotton and woolen factories, iron-works, extensive manufactories of machinery, locomotives, carriages, glass, boots and shoes, etc. The state draws a large revenue from 1323 m. of railway, and several important canals, connecting

New York and the coal regions of Pennsylvania. There are 4 colleges, normal and free schools, numerous churches, periodicals, and daily papers. The government is similar to those of all the states.

New Jersey was settled in 1620 by Dutch and Swedes. Taken by the English, it was ceded by Charles II. to the duke of York; it was retaken by the Dutch in 1673, and afterwards bought by William Penn and other Friends, who have here numerous descendants. It was the scene of some of the most important military movements of the war of independence, and of the battles of Trenton, Princeton, Monmouth, and Germantown. Pop. in 1840, 373,306; in 1860, 672,031; in 1870, 906,096.

NEW JERSEY (*ante*). One of the original thirteen United States of North America, lying between the Hudson river and the Atlantic ocean on the e., New York on the n., Delaware bay and river and Delaware and Pennsylvania on the w., and Delaware bay on the s., mostly between 39° and 41° n. lat. and meridians 73° 53′ 51″ and 75° 33′ 02″ w. from Greenwich. Its extreme length is 168 m.; greatest breadth, 59 m.; narrowest part, 32 m.; 7,576 sq.m., or 4,849,000 acres; pop. '80, 1,130,892. There are 21 counties. Trenton is the capital; Newark the largest city. The following table shows the growth of the state and the character of its population from 1790 to 1880 inclusive:

Year.	Total population.	Male.	Female.	White.	Colored (free).	Colored (slave).	Native.	Foreign.	Density per sq. m.	Ratio of inc.
1790	184,139	94,188	89,951	169,954	2,762	11,423	.....	.....	22.12	.....
1800	211,149	108,899	103,050	194,325	4,402	12,422	.....	.....	25.38	15.10
1810	245,562	125,811	119,744	226,868	7,843	10,851	.....	.....	29.51	15.86
1820	277,575	140,097	137,478	257,409	12,460	7,557	.....	.....	33.36	13.04
1830	320,823	163,089	157,734	300,266	18,303	2,254	.....	.....	38.56	15.58
1840	373,306	188,138	185,168	351,588	21,044	674	.....	.....	44.87	16.36
1850	489,555	245,346	244,209	465,509	23,810	236	429,176	59,948	58.84	31.14
1860	672,035	335,051	336,984	646,699	25,318	18	549,245	122,790	80.77	37.27
1870	906,096	449,672	456,424	875,407	30,658	None.	717,153	188,943	108.91	34.83
1880	1,130,983	559,823	571,160	1,092,017	38,853	.....	909,416	221,700	149.27	24.80

By the above table it appears that the ratio of increase of population more than doubled its preceding rate between the years 1840 and 1870, and was in 1880 decreasing. In 1790 it was the ninth state in population; in 1880 the nineteenth.

Topography.—Three ranges of mountains of moderate height traverse the n. part of the state in a direction n.e. and s.w., and all form low links in the Appalachian chain, which merge into the Catskills, the Shawangunk, and the Highlands of the Hudson on the n.e., and are divided from the Alleghany mountains of Pennsylvania by the Delaware river on the s.w. The outcropping rock formations cross the state in bands, in the same n.e. and s.w. direction. The most northerly and highest range of mountains is the Blue or Kittatinny, having a maximum height of 1800 ft. near the New York line, whence it forms an unbroken ridge to "the Delaware water gap." This range has a more rapid ascent on the e. side than on the w., and its summit has a considerable extent of table-lands, naturally well timbered and fertile, under culture. The Kittatinny valley lies between the range just described and the Highland range s.e. of it. It is a valley of great beauty of scenery and agricultural capability, from 500 to 650 ft. above the sea, about 39 m. in length by 10 in breadth. Berkshire, Longwood, and Greenwood Lake valleys are smaller vales of the same general character. The Highland range next s.e. is in many broken mountain ridges and spurs, extending over a width of 22 m. on the n.e. boundary of the state, and narrowing to 10 m. at the Delaware river, where they leave the state. The maximum height of this range is at Rutherford's hill or Hamburg mountain, 1488 ft. above the sea, and Wawayanda mountain, near the New York line, which is 1450 feet. The summer resorts on Schooley's and Musconetcong mountains are on two separate ridges of this range. This range of hills and ridges is generally more abrupt on its s.w. than on its n.e. side. The trap-rock formation which the Hudson river exhibits in its palisades, beginning a few miles above New York, is a dike breaking through a red sandstone formation which approaches the Hudson from the w., turns s. so as to form the palisades, and terminates at Jersey City, near which it has been tunneled by the Erie and the Delaware, Lackawanna and Western railway companies, and cut deep for the passage of the New Jersey Central. West of this ridge of trap rock are what are known as first, second, and third mountains, being the names given to the successive comparatively abrupt ascents from the alluvial levels near New York bay to the mountain ranges before described. Parts of the first rise are known as Orange, Fairmount, and Mont Clair mountains. This portion of the state, geologically a part of the sandstone belt, is one of the richest upland slopes, and has been noted as the northernmost limit of many trees and shrubs of the southern states, which found protection from westerly winds on the e. sides of the hills, with a climate modified by proximity to the sea. Michaux, in his *North American Sylva*, shows that he found a greater variety of trees and shrubs in this locality than in any other part of the northern states. South-west of the Orange mountain range are

trap ridges, known as Rocky hill, Ten-Mile-Run mountain, Long hill, Sourland mountain, and Goat hill; and, further n., Round mountain and Pickle mountain, the latter 767 ft. above the sea. All these elevations of trap rock show their most abrupt faces to the e., and slope away gently to the westward. The s.e. part, and nearly two-thirds of the area of the state, has no elevations of any importance; the Neversink highlands, seen from Sandy Hook as one approaches by sea from the e., have a maximum height of 400 feet. They are exceptional elevations in a gently rolling sandy plain which stretches from the sea to the Delaware river, with a slight rise from each towards the center of the state, where the average summit-level is about 160 ft. above the sea.

The state has several distinct drainage basins, which should really be grouped into only two systems. those whose water-shed is to the Atlantic ocean, and those which contribute to the Delaware river and bay. The latter drain more than one-half of the entire state from n. to south. Beginning at the n., on the sea-side slope, an exceedingly narrow strip drains into the Hudson. On the w. side of the palisade dike the Hackensack comes into the state from New York, and flows southwardly through a narrow valley into Newark bay, w. of and parallel with the bay of New York. The Passaic river, next w., has its sources near the center of the northern half of the state, directly w. of New York; flows thence n.e. to its junction with the Pequannock, the Ringwood, and the Ramapo; then e. through a gap in the Highland range, and through Paterson, to its main valley, through which it courses southerly to Newark bay. The Raritan is a larger stream, having its sources directly w. of those of the Passaic, flows southerly within 15 m. of the Delaware river, and then in a generally e. course to its mouth in Raritan bay, s. of Staten island. Its principal tributaries are the Laurington, Millstone, and South rivers. It has the largest and most fertile basin of the Atlantic slope of the state. South of Raritan bay the streams which empty into the sea are small down to Toms river, a stream about 30 m. long, emptying into Toms bay, an estuary from Barnegat bay. Thirty m. s. of that is the Little Egg Harbor river, and 20 m. further s. is Great Egg Harbor river, both draining the southern part of the state from within 15 m. of the Delaware river. The main streams, draining the western slope into the latter river, beginning at the n., are Paulius-kill, Paquest creek, Musconetcong river, emptying about 10 m. below Easton, Penn., and Rancocus creek. Smaller streams are numerous. On the s. the Maurice river drains a considerable area into Delaware bay. One hundred m. of the Atlantic shore, n. of cape May, is a continuous line of harbors and bays, separated from the sea by long stretches of beach, with few inlets on the n. and many on the south. Barnegat bay and Little Egg harbor form a continuous bay more than 40 m. parallel with the sea, with inlets only at the middle and at the s. end. Atlantic City has been built for a summer resort on the outer beach, midway between Little Egg and Great Egg harbors. See Atlantic City. The extent of inland navigation formed by the bars is about 75 m. from n. to s., but in length of inland shores it is several hundred m. in extent. South of Barnegat bay and Little Egg harbor the inlets are very numerous to these inland channels. The harbors are: Great bay (at the mouth of Little Egg Harbor river), Little bay, Reed's bay, Absecum bay (entered through Absecum inlet just n. of Atlantic City), Lake bay, Great Egg harbor, Peck's bay, Ludlow's bay, Townsend's sound, Style's sound, Leaming's sound, Jenkin's sound, Grassy sound, Richardson's sound, Jarvis sound, and Cape Island sound. The n. shore of Delaware bay is mostly marshy, with no outer sea-beach inclosing harbors and inland passages as on the Atlantic side. See Cape May.

There are many pretty lakes in the northern part of the state. Greenwood lake, in Passaic co., sometimes called Long pond, the largest, lies across the n. boundary, one-half in New York and one-half in New Jersey. It is 8 m. long and 1¾ m. in greatest width. In Sussex co. is Culver's, and many smaller ponds. In Morris co. are lakes Hopatcong, 5½ m. long and 1¾ m. wide; Budd's lake, 2 m. long and 1 m. wide; and Green pond, a charming lake, at an elevation of 1044 ft. above the sea, between Green Pond mountain and Copperas mountain, 3 m. long and half a m. wide.

The soils of different parts of New Jersey differ to an unusual degree. On the valleys of the Delaware, the Rapidan, the Passaic, and in many valleys among the mountains of the n. part, the soil is of the best quality. The eastern slope of First, or Orange mountain, which is a red sandstone formation, was remarkable in a state of nature for the variety and strength of its forest vegetation. In general, it may be stated that the central part of the state is the most fertile, and adapted to the greater variety of products. While parts of the alluvial basins are rich enough to bear crops of tobacco, other sections were originally so thin as to have given rise to the expression—"as poor as the barrens of New Jersey." But those sand-barrens, as they were called, have been found well adapted to fruits and vegetable gardening. The average value of farming land in 1870 was $86.14 per acre. The geologic survey of the state has called attention to the oak and pine lands of its southern part. Two-fifths of the area of the state s.e. of the marl belt is divided into two classes: the sands upon which pines alone thrive, and those which grow oak as well as pine, which have more clay and humus. The white-oak bottoms are the best parts of the latter. The oak lands have been found particularly susceptible to improvement, and are showing good crops of grains as well as fruits since intelligent industry has been applied to them.

Geology.—The bands of geological outcrop cross the state from n.e. to s.w. The

azoic (granite, crystalline limestone, and gneiss) and the paleozoic (sandstone, fossiliferous limestones, shales, and slates) are interlaced in the formation of the extreme n.w. part of the state. The Highland range, of which Morristown may be considered at the center of the belt, is mostly underlaid with the azoic rocks, though the paleozoic are not unfrequently seen outcropping in the valleys. The triassic formation, in which the red sandstone is broken by irruptions of trap and basalt, occupies a broad belt running from n.e. to s.w. across the state s.e. of a line drawn from Jersey City to Trenton. This is the most fertile section of the state. The cretaceous formation, including the greensands, chalks, marls, plastic clays, and mixture of marls, clays, and sands, forms a band s.e. of the sandstone belt, extending from Raritan bay to the head of Delaware bay. The remainder of the state s.e. is of the tertiary and drift formations of sands, gravel, loam, and marls. The state's geologic surveys have been quite exhaustive. Prof. Henry D. Rogers made the first in 1839–40; the second was undertaken by Dr. Wm. Kitchell in 1854; the third by prof. George H. Cook, state geologist, was begun in 1864, and has been continuous since. A volume, entitled the *Geology of New Jersey*, embraced the results of surveys up to 1868, since which time annual reports have been published.

Mineralogy and Geologic products.—The azoic and paleozoic formations of the n.w. part furnish magnetic iron ores in many places in Sussex, Warren, Morris, and Passaic counties; the product in 1873 amounting to 665,000 tons. The greater portion of this ore is sent to the furnaces of Pennsylvania, near the coal supply. About one-fifth of it is worked up by the local blast-furnaces at Ringwood, Boonton, Stanhope, Oxford furnace, and Phillipsburg. In 1874 there were 214 iron mines of magnetic ores; 12 mines of red and brown hematite ores worked on a large scale; besides mines of bog-iron worked here and there on a small scale. Copper ores have been found and worked in Somerset co., but have not proved remunerative. Zinc ores have been found in two places in Sussex co., said to supply $\frac{7}{10}$ of the zinc oxide and $\frac{1}{5}$ of the metallic zinc product of the United States. In 1868, according to prof. Cook, 25,000 tons of zinc ores were taken out in that county, since which time there has been a falling off. Lead ore is often found, but has not been of a profitable grade to work; nickel also has been found. Graphite, or plumbago, has been mined with profit in several places in Morris and Passaic counties. Sulphate of baryta, manganese, and iron pyrites are mined and used in the manufacture of sulphuric acid, and greensand and other sands for glass-making and chemical uses are drawn from many parts. Mineralogists enumerate upwards of 160 minerals which are found in the state. The proximity of the mineral regions of New Jersey to the great city of New York brings all its mineral wealth into convenient use, and gives it high value. The geologic products of highest value to the state are its extensive deposits of pure marl, clay marl, and shell marls, used in connection with other fertilizers; for on these have depended the improvement of millions of acres of its soil, large portions of which were formerly considered too poor to cultivate, but are now made productive beyond the average per acre of any state in the union. These marls will probably be the means, in connection with the excrements of the great neighboring cities, of making New Jersey, in soil, one of the richest, instead of one of the poorest states. Upwards of 200,000 tons of marl were used annually before 1875. The quantity now used must be double that. Lime is quarried in vast quantities for burning to make into quick-lime for mortar, and also for fertilizing. Porcelain and potter's clays of excellent quality, found in the state, are used in manufacturing, to the amount of 300,000 tons annually. Kaolin also is found in large deposits, though much of it is not of superior quality. Morris co. furnishes infusorial earths, used in the manufacture of dynamite and giant powders, and for polishing purposes, and sand valuable for molding purposes and to enter into the composition of fire-brick for reverberatory furnaces. Burlington co. also supplies these sands. A pure white sand of the finest quality, for glass-making, is found in s. New Jersey, and used in the glass-works of Glassboro and Millville. The variety of building stones furnished by the quarries of New Jersey is great, and includes fine granite, or gneiss-granite, sandstones of a variety of tone and quality, limestones (including water-lime and some marbles), bluestone, trap-rock, slates, fire stones, and conglomerate, altogether providing the great cities around New York bay with a large part of all their building and paving-stones. Trinity church in New York is an example of brown sandstone from the New Jersey quarries.

Climate.—Proximity to the Atlantic on its whole eastern and southern parts, and its generally low surface above the sea, give New Jersey a climate of less extreme cold than the states inland in the same latitude, but not less extreme heat. The southern counties, however, surrounded by sea waters, show less range between extremes than other portions of the state. Where fresh water joins the sea the marshes are malarious, and there are some portions of the lands overlying the trap-rock dikes where water settles into fissures below the surface and gives rise to malarial diseases. The very rich alluvial lands of the Delaware were formerly more subject than any other portions of the state to the same class of ailments, but in general have long since become quite as healthful as the average of lands. As a whole the state is eminently healthful, and the sandstone belt is considered particularly favorable to persons inclined to lung disease. The following table of thermometric and barometric observations gives the climate of Newark, which may be taken as representing the average of the state:

Mean temperature, year	(F.)	51°.25	Range of temp'ture, autumn,	(F.)	62°	
Highest " "	"	98°.5	Mean " winter,	"	28°.90	
Lowest " "	"	12°.5	Highest " "	"	59°	
Range of " "	"	110°	Lowest " "	"	12°.50	
Mean " spring,	"	48°.48	Range of " "	"	71°.50	
Highest " "	"	85°.50	Rain fall, year		54.73	in.
Lowest " "	"	15°.20	" " spring months		13.52	"
Range of " "	"	70°.30	" " summer "		24.12	"
Mean " summer,	"	70°.40	" " autumn "		7.79	"
Highest " "	"	98°.50	" " winter "		9.30	"
Lowest " "	"	48°.80	Barometer, annual mean		30.093	"
Range of " "	"	49°.70	" mean spring		29.990	"
Mean " autumn,	"	54°.80	" " summer		29.997	"
Highest " "	"	84°	" " autumn		30.024	"
Lowest " "	"	22°	" " winter		30.089	"

Industries—Agriculture and Horticulture.—The total number of farms in 1880 was 34,307, averaging 85 acres, or a total of 2,929,773 acres of farm land, of which 24.4 per cent. were unimproved. The value of farm lands was $190,895,833 of farming implements and machinery, $6,921,085; of live stock, $14,861,412; of all farm products, $29,650,756; of orchard products, $860,090; of market garden products, $1,841,863. The following table is from the report of the U. S. commissioner of agriculture for 1884:

		Quantity.	Average yield per acre.	Number of acres.	Value per bush. or ton.	Total value.
Indian Corn	bushels.	9,715,100	28.0	346,971	65	$6,314,815
Wheat	"	2,063,600	13.4	154,000	110	2,269,960
Rye	"	1,028,976	10.1	101,488	75	771,732
Oats	"	4,265,800	32.6	130,873	40	1,706,320
Barley	"	4,198	16.9	249	76	3,190
Buckwheat	"	244,608	7.0	35,026	90	220,147
Potatoes	"	4,275,857	97.0	44,081	55	2,351,721
Hay	tons.	610,751	1.20	508,959	1,375	8,397,826
Total acreage and values				1,321,647		$22,035,711

The following table from the same report exhibits the live stock at the beginning of 1884:

	Number.	Average price.	Value.
Horses	89 574	$103.00	$9,226,122
Mules	9,286	121.14	1,124,906
Milch Cows	164,566	39.33	6,472,381
Oxen and other cattle	69,947	37.57	2,627,909
Sheep	117,008	4.32	.....
Hogs	212,541	11.20	2,380,459
Total	662,922	.....	$21,821,777

The cranberry harvest the same year was estimated at nearly $500,000. Sweet potatoes are grown to a large extent, the sandy lands of the state being the most northerly section of the country in which they are grown with profit. The fisheries on the coast, especially of oysters, are a prolific source of wealth, and in 1880 returned nearly $3,200,000 worth of products. The state has a board of fish commissioners, who are engaged in stocking its fresh-water streams and upland lakes from their hatcheries. A board of riparian commissioners have charge of the interests of the state in lands under tide-water.

Manufactures.—The census of 1880 showed that N. J., although only the 35th among the 38 states in area and the 19th in population, was the 6th in mechanical and manufacturing industries. The number of establishments was 7,128, employing 126,036 hands; the capital invested was $106,226,593; the wages paid during the year, $46,083,045; value of raw materials, $165,285,779; value of products, $254,380,236. The value of the manufacturing products of Newark alone was $69,252,705, placing it third in this respect among the cities of the Union. The silk mills of Paterson, the iron works in the cos. of Morris, Sussex, and Warren, the steel, zinc and black-lead works of Jersey City, and the potteries of Trenton are noted for the extent and excellence of their work. In the number of establishments throughout the state, the blacksmithing industry leads

with 744 ; next in order come flouring and grist-mills, 481 ; boots and shoes, 398 ; wheelwrighting, 364 ; carpentering, 319 ; lumber mills, 284 ; tobacco and cigars, 283 ; saddlery and harness, 194. In the value of products, sugar and molasses leads, the total being $22,841,258. Then, in order, come—silk and silk goods, $17,122,236 ; leather, $15,475,222 ; iron and steel, $11,837,846 ; foundries and machine shops, $11,282,748 ; hats and caps, $6,152,447 ; breweries, $5,798,330 ; boots and shoes, $5,262,671. The largest increase was in silk and silk goods, of which the value of products in 1870 was only $4,527,644, or little more than a fourth of the value in 1880. In that year N. J. manufactured more than one-half of the total amount produced in the U. S., and consumed more than 60 per cent. of the raw silk imported into the country. This business also employs the largest number of hands, 12,549, the next largest being foundry and machine shops with 8,205. In the manufacture of glass N. J. is the second state in the union, the value of its products in 1880 being $2,810,170, a percentage of 13.28 of the total value of glass products in the U. S.

Commerce.—The metropolis of New York is the great port of entry of the United States, and still more exclusively of the state of New Jersey ; so that the foreign commerce of the state shows as a part of the customs business of that city, and its commercial relations with other states of the Union also appear in the statistics of the imports, exports, and sales of the city of New York. The 6 custom-house districts have as ports of entry Perth Amboy, Newark, Little Egg Harbor, Great Egg Harbor, Burlington, Bridgeton, Lamberton, and Tuckerton. The number of foreign vessels entered and cleared in 1874 was but 61, amounting to 9,707 tons—or less than 160 tons each ; American vessels 35, tonnage 6,043, averaging 173 tons each. The registered, enrolled, and licensed tonnage belonging in New Jersey custom districts, June 30, 1884, was 1,104 vessels, aggregating 91,874 tons. Of these 110 were steamers, representing 16,423 tons. While these figures are insignificant compared with the real share which the products and the capital of New Jersey have in foreign and coastwise commerce, railroads, on the other hand, bear across the state an immense commerce between the great cities of New York and Philadelphia and the country at large. By the returns in 1884, 80 railway companies have charters from the state, representing 1,844 m. of road. Seventeen are operated by their own boards ; the other 63 are leased by seven railway corporations. A general law for the incorporation of railway companies was passed in April, 1873, doing away with special charters and monopolies in the future. The capital in railways and equipments in the state in 1883 was $227,384,534. The horse railways of the larger cities of the state, with their equipments, represented, in 1875, a capital of $1,550,000, managed by five companies.

Canals.—The canals of New Jersey were once its principal commercial channels. The Morris and Essex canal, 101 m. long, from Jersey City to the Delaware river, at Phillipsburg, was built before the Erie canal of New York, and has always transported vast quantities of coal from Pennsylvania to New York. By its corporation charter it was invested with banking powers, or, rather, its corporators assumed such powers from the indefinite range of the powers granted. It cost originally £2,825,997. The Delaware and Raritan canal, from New Brunswick to Bordentown, 43 m. long, with a feeder to Trenton 22 m., was built in the beginning of the present century, at a cost of $3,935,287. It is under lease to the united railroad and canal companies of New Jersey.

Education.—The children of school age (5 to 18 years) enumerated in 1882 were 343,897 ; the enrolled children of the public schools, 209,526 ; average attendance, 113,522 ; number attending private schools, 44,560 ; attending no schools, 89,254. The public school buildings provide places for 189,871. The number of school districts is 1,366 ; number of public school buildings, 1,577. The whole number of private and church schools was 261, a decrease of 36 since the preceding year ; the number of teachers, 377 ; the whole receipts for public schools were $2,142,385 ; expenditure, $1,987,671 ; teachers employed, 3,486, of whom 926 were men, and 2,560 women ; average monthly salary of men, $51.07 ; of women, $32.63. Value of public school buildings and realty, $6,270,778. The cities have a distinct organization of their schools under the control of city superintendents, who, however, are subject to the state laws and the direction of the state superintendent of education. Each county has a superintendent, and teachers' institutes have been organized in 18 of the 21 counties. The state normal school for teachers, at Trenton, embraces a system of model schools in which the students are trained in the respective departments of school teaching. The Farnham preparatory school at Beverly prepares students to enter the normal school, or for the practice of business. Newark has a normal school for the purpose of preparing teachers for the city schools ; Hoboken and J. City, normal classes. Free evening schools are held in many of the large cities. The public schools ignore distinctions of race, religion, and color. Among legislative acts passed in 1882, were the following : to encourage the establishment of public libraries in any town or municipality in the state and to provide for taking care of and perpetuating the same ; and to permit women to be eligible for school trustees. In 1879 an act passed the legislature for the establishment of schools for industrial education. The annual school tax on all the property of the state is two mills on a dollar, which yielded in 1883, $1,375,699. In addition to the fund raised annually by this tax New Jersey has a school fund valued in 1883 at $3,235,767, of which $1,012,111 was invested in bonds

and mortgages, $705,000 in U. S. bonds, $93,360 in bonds of school districts. For higher education there are 4 colleges, 4 collegiate schools for women, 3 scientific schools, including the state agricultural and scientific college connected with Rutgers, and 5 theological schools, besides many private seminaries for the instruction of youth of both sexes in the higher courses of study. The colleges are: Burlington (Episcopal) at Burlington, founded in 1846; the Rutgers (q.v.) (Reformed) at New Brunswick, founded in 1770; the Princeton (Presbyterian) at Princeton, chartered as the college of New Jersey (q. v.) in 1746; the Seton Hall (q. v.) (Roman Catholic) at South Orange, chartered in 1856; the Bordentown female college at Bordentown, founded in 1851; the Ivy Hall college for women at Bridgeton, founded in 1861; St. Mary's Hall (Episcopal), Burlington, founded in 1837; the Pennington female collegiate institute at Pennington, founded in 1840. The schools or colleges of science are: the Stevens institute of technology (q. v.) at Hoboken, founded in 1871; the scientific school of Rutgers institute (including the state agricultural and scientific college) at New Brunswick, founded in 1864; and the John C. Green school of science at Princeton (q. v.), founded in 1873. Most of the above colleges have preparatory schools connected with them. The Peddle institute at Hightstown is a high grade seminary founded in 1864. New Jersey is rich in theological institutions. At Princeton is the theological seminary of the Presbyterian church, founded in 1882; the seminary of the Reformed church in America at New Brunswick, founded in 1784; the Drew theological seminary (q. v.) (Methodist) at Madison, founded in 1867; and the German theological school of Newark presbytery at Bloomfield, founded in 1869. Seton Hall gives theological instruction in its collegiate course. Of churches and their adherents the following table presents a synopsis for 1874:

Name of Sect.	Number of organizations.	Church buildings.	Ministers and priests.	Communicant members.	Adherent population.	Value of church property.
Baptist	169	169	178	28,296	117,000	$2,843,500
Free Will Baptist	5	4	4	412	2,000	25,450
Christian	12	10	8	840	3,900	58,000
Congregational	20	20	28	2,558	10,000	483,600
Episcopal	129	126	144	12,116	54,000	2,637,000
Friends	65	65	none.	5,850	20,000	480,500
Jew	2	2	3	300	1,500	23,500

Unitarian	1	1	1	....	350	11,000
Universalist	4	2	3	....	1,000	105,000
Union	2	2	2	150	750	5,000
Totals	1,504	1,455	1,421	185,160	943,275	$19,043,510

The schedule of the riparian commissioners for 1883 showed that out of nearly four and a half million lineal feet of riparian lands, but half a million had been sold, although the prices ranged from 20 to 30 cents per foot on unimproved beaches, to $50 on the bay of N. Y. and the Hudson river. The maximum price of these lands was fixed by law in 1869. In the same year, the hours of labor for children were limited. The state militia consisted of 48 companies of infantry and 2 Gatling-gun companies (3,034 men).

The journals published in 1880 were as follows: Dailies, 27; tri-weekly, 1; semi-weekly, 6; weekly, 163; bi-weekly and monthly, 15; total, 215. One weekly and 1 monthly are devoted to the cause of temperance, 1 paper to mechanical information, 3 monthlies to literature alone, 1 monthly to law, and 4 papers to college matters. Of these, 19 are in the German language. The aggregate subscription to these papers varies from 200,000 to 300,000 per year, and the total number of copies circulated annually exceeds 20,000,000.

There are many seaside resorts; among them: Long Branch, Atlantic City, Cape May, Asbury Park, Elberon, Deal, Sea-Girt, Point Pleasant, Spring Lake, Squan, and Ocean Grove. The majority are at the upper end of the coast, and within easy access from N. Y. City. Atlantic City, Asbury Park, Cape May, and Long Branch have the largest summer population, and the first named has within a few years become popular as a winter resort for invalids, as has also Lakewood, among the pine forests. The towns and villages within a radius of 20 m. of N. Y. have been well described as the dormitories of that city.

History and Government.—The date of the first settlement is not certainly known. Dutch traders are believed to have occupied Bergen point between 1614 and 1620. On the e. bank of the Delaware a party of Dutch under Cornelis Jacobson Mey and Adriaen

Jarisz built a fort 4 m. below Philadelphia in 1623, and called it fort Nassau. The king of England, in 1634, granted the whole region along the Delaware to sir Edward Ployden under the name of New Albion, and in 1638 Swedes and Finns purchased lands of the natives and settled on the river. The Dutch and Swedes prevented the English from getting a foothold, however, until 1655, when Peter Stuyvesant from New Amsterdam (New York) drove out the Swedes, or forced them to acknowledge Dutch rule. In 1664 Charles II. assumed sole jurisdiction, and granted all the country between the Delaware and Connecticut rivers to his brother, the duke of York, who took possession of New Amsterdam with a force sent out under col. Richard Nichols, who soon after made land grants w. of New York bay to colonists from New England, who began the settlements at Newark, Elizabeth, Middletown, and Shrewsbury. The next year the duke of York assigned his grant to lord Berkeley and sir George Carteret, who named the region New Jersey in compliment to the isle of Jersey, where Carteret had been the king's governor. Elizabeth was made the seat of government in 1665, and Philip Carteret was the first governor of New Jersey. He was not liked, and had trouble with the colonists about land rents. He went to England in 1670, returned soon afterwards, and continued governor till 1674, when the Dutch recaptured New Amsterdam, and the adjacent country fell into their hands. But Great Britain regained possession by treaty the same year. The conflicting claims of grantees of lands from Nichols and from Carteret were settled by the king, who confirmed all grants to his brother and Carteret. But the duke had made a conveyance to sir Edmund Andros, governor of New York, who assumed the power to control the government in New Jersey also; and in April, 1680, imprisoned Carteret. The duke of York interceded in behalf of the grantees under Nichols and New Jersey's governor, and in 1681 they were settled in their rights. In the meantime (1673) William Penn with other Quakers had bought Berkeley's interest in New Jersey, and in 1675 had established a Quaker settlement at Salem, in the southern part of the state. One Fenwick seems to have exercised jurisdiction in s. New Jersey after the settlement at Salem, up to a line drawn from Little Egg Harbor to lat. 41° on the Delaware, while all of Jersey n.e. of that line remained under the gubernatorial rights of Carteret. In Feb., 1682, William Penn and 11 other friends purchased the whole territory. In 1668 a legislative assembly had convened at Elizabeth, and passed criminal laws of excessive severity. Another was convened in 1675. Robert Barclay, a Scotchman, one of the associate purchasers, was the first governor under the new ownership in 1682. Respect for the rights of the settlers and a peaceful and wise administration gave New Jersey 20 years of prosperity. But the company-proprietorship of so large a country was found to have such disadvantages that in 1702 the proprietary rights of the purchasers were ceded back to the crown, and the same year queen Anne appointed lord Cornbury governor of New York and New Jersey; but each colony continued to have its separate assembly. In 1708, on the petition of the colony to have a separate administration, Lewis Morris was made governor of New Jersey, which then had a population of 40,000. The growth of New Jersey was peaceful until the beginning of the revolution. The last royal governor was William Franklin, son of Benjamin Franklin, who was appointed in 1763, and was noted as a bitter tory. New Jersey, through her legislature, entered cordially into the measures for the defense of colonial rights against the oppressive legislation of the mother country, and on July 2, 1776, anticipating the declaration of independence by the continental congress, adopted a state constitution, which was ratified on the 18th, and which continued as the organic law until 1844, when another was adopted. On June 25, 1776, governor Wm. Franklin, who had set himself against the action of the legislature, was deposed, placed under guard, and sent to Connecticut a prisoner. William Livingston was elected governor Aug. 13, 1776, and re-elected for 14 years. The important battles of Trenton, Princeton, and Monmouth are historical mementoes of New Jersey's part in the war for independence. Her position in the center of the confederacy made her soil the principal theater of war. Trenton was made the state capital in 1790. The constitution of 1776, which was superseded by another Aug. 13, 1844, was again materially modified by a commission of 14 in 1873, whose work was approved by the legislature in 1874, and again in 1875, and ratified by the people by an immense majority the latter year at a special election. The following is a list of New Jersey's governors since the state organization: William Livingston, 1776–90; William Patterson, 1790–94; Richard Howell, 1794–1801; Joseph Bloomfield, 1801–12; Aaron Ogden, 1812–13; William S. Pennington, 1813–15; Mahlon Dickerson, 1815–17; Isaac H. Williamson, 1817–29; Peter D. Vroom, 1829–32; Samuel L. Southard, 1832–33; Elias P. Seeley, 1833; Peter D. Vroom, 1833–36; Philemon Dickerson, 1836–37; William Pennington, 1837–43; Daniel Haines, 1843–44; Charles S. Stratton, 1844–48; Daniel Haines, 1848–51; George T. Fort, 1851–54; Rodman M. Price, 1854–57; William A. Newell, 1857–60; Charles S. Olden, 1860–63; Joel Parker, 1863–66; Marcus L. Ward, 1866–69; Theodore F. Randolph, 1869–72; Joel Parker, 1872–75; Joseph D. Bedle, 1875–77 ; George B. McClellan, 1877–81 ; George C. Ludlow, 1881–84 ; Leon Abbett, 1884. The legislature consists of a senate and a general assembly. One senator is elected from each county for three years, making 21 members. The assembly is limited to 60 members, elected annually, and represents districts apportioned by population after each national census. The governor is elected for three years. The treasurer and comptroller are elected by the legislature for three years. The attorney-general,

secretary of state. superintendent of schools, prosecuting officers, and clerk of the supreme court are appointed by the governor, subject to the approval of the senate.

Judiciary.—The distinction between courts of law and courts of equity is still maintained in New Jersey. All judges are appointed by the governor for a term of six years, subject to confirmation by the senate. The first, or lower courts, are the county courts of common pleas and oyer and terminer, consisting of not more than five judges; an orphan's court, and court of general quarter sessions of the peace. Next above is the supreme court, which makes the circuit of the state, and is composed of a chief-justice, and eight associates. A prerogative court is presided over by the chancellor alone. The court of errors and appeals in the last resort is composed of the chancellor, the justices of the supreme court, and six judges. The pardoning power is vested in the chancellor, 6 judges, and the governor ; but is not exercised without the sanction of the governor.

Charitable Institutions.—There is a state board of charities, a part of whose duties is to visit the state institutions, those of the counties, and private incorporate benevolences. Care and instruction to the deaf and dumb was provided out of the state at New York and Buffalo, until 1883, when a state institution was completed at a cost of $49,266. The blind are taken care of in New York and Pennsylvania institutions at a cost of about $14,000 per annum. Idiocy and insanity are greatly on the increase. The total number of insane, idiots, and epileptics for 1878 was 9,501 ; mortality among them, 706. Idiots and the feeble-minded are sent to the training school at Media, Penn., and to institutions in Conn. The home for disabled soldiers is maintained at an annual cost of from $30,000 to $40,000. The home for soldiers' children, formerly maintained, has been closed, after having executed its trust in educating and providing homes for them. An act for the establishment of orphan asylums was enacted Mar. 9, 1877, providing that any five or more persons may form themselves into an orphan-asylum association for the purpose of receiving, supporting, and educating orphan children, under such name as they may choose, after being duly incorporated under the further provisions of the act. Such private associations are believed to be a more efficient means of providing for the orphans in each locality than state institutions. An industrial school for girls at Trenton is maintaincd by the state. A state reform school for juvenile delinquents is located at Jamesburg in Middlesex co., on a farm of 490 acres, where the boys are employed at farm labor and taught a few trades. The old state lunatic asylum is at Trenton. The number of patients in 1882 was 763, and its expenses the same year, $151,061. The state pays $1 per week for every county patient in addition to what each county is obliged to pay for those it sends. The institution derives a revenue from the care of private patients who are sent to it. The new asylum for the insane at Morristown is one of the finest structures for the purpose in the country, having recently been finished at a cost of about $650,000. It will accommodate upwards of 800 patients. In 1882 it maintained 707—143 private patients. The state prison is at Trenton. Its average number of convicts is 815. The earnings of prisoners, 1883, amounted to $72,706 ; the expenditures to $133,473. The manufactures include shoes, shirts and collars, boxes, whips, rubber goods, and laundry work ; average pay, 50 cts. per day. In 1879 the legislature appointed a special committee to prepare a report on the questions of prison labor and its relation to other labor, which it is supposed will be the basis of the future prison policy of the state.

Among the disbursements of the state fund in 1883 were the following :

Court expenses	$119.163
State Insane Asylum	89,342
County " "	32,545
Deaf and dumb, blind and feeble-minded	70,454
State Institution for deaf and dumb	13,500
Militia	58,354
Education	6,597
Riparian commission	11,000
Inspection of fisheries	6,972
Geological survey	8,024
Agricultural experiment station	7,916
Agriculture	3,858
Bounty on sugar	8,837
" fibrous plants	1,376
Pensions	3,830
Preservation of records	4,804
Bureau of statistics	3,817

The outstanding debt of the war loan, originally about $2,500,000, was reduced by Nov., 1884, to $1,596,300 ; $100,000 must be paid annually on this. Of this, the sinking fund, which has increased to $1,088,206, pays $10,000 per annum, besides paying the interest on the entire debt ; leaving $90,000 to be raised annually by taxes. This fund will probably be exhausted by 1893, leaving $800,000 unprovided for. All the state's

floating debt was paid off in 1878, leaving a balance in the treasury of $120,000. The general fund state tax is one mill on the dollar valuation; the school tax, two mills on the dollar. The state taxes are low, but the county taxes and the municipal taxes of many of the cities have been ruinously high, being on an average about eight times as much as state and school tax combined. A poll tax of $1.00, for local purposes, is imposed on male inhabitants of 21 years and over, but no voter loses his vote by reason of non-payment of this tax. The valuation of real and personal property in 1883 was $548,945,069. The amount raised by taxation in the year ending Nov. 1, 1884, was $1,375,588, the state receipts in the same year were $1,258,047.36, and the state expenditures $1,120,495.79. In 1884, a woman suffrage amendment obtained 24 out of 27 votes in the assembly.

In 1884, the fourth presidential candidate in the field, B. F. Butler, received in N. J., 3,456 votes.

It will be seen that New Jersey cast her electoral votes for presidents Washington and John Adams; against Jefferson for his first term in 1800, and for him the second in 1804; for Madison's first term in 1808, and against his second in 1812; for James Monroe both terms, 1816–20; against John Quincy Adams in 1824, when he was elected, and for him in 1828, when Andrew Jackson was elected; for Jackson's second term in 1832; against Van Buren in 1836, when he was elected, and for him in 1840, when Harrison was elected; against Polk in 1844; successively for the presidents-elect Pierce,

Buchanan, and Lincoln, in '52, '56, and '60; against Lincoln's second term; against Grant in '68, and for him in '72; against Hayes in '76; against Garfield in '80; and for Cleveland in 1884.

NEW JERSEY, COLLEGE OF, founded through the exertions of some leading members of the synod of New York—which then included many of the Presbyterian churches in New Jersey—under charters granted, 1746, by acting governor Hamilton, and, 1748, with more liberal provisions by governor Belcher. It was opened, 1747, at Elizabethtown; was removed to Newark, and thence to Princeton, where a large college building was erected and named Nassau hall, in honor of William III. of the house of Nassau. This building was used as a barrack and hospital by both American and British soldiers during a part of the revolutionary war. At the battle of Princeton, the British troops made a stand within its walls, and were driven out by Washington's advance. The continental congress met in it in 1783, and attended the commencement of that year in company with Washington, who presented 50 guineas to the trustees to aid in repairing the damages occasioned by the battle. The money was used for a full-length portrait of Washington—painted by the elder Peale—to fill the vacancy in a large gilt frame, hanging in the prayer-hall, from which the portrait of George III. had been shot away by a cannon ball during the assault. Jonathan Dickinson was the first president, Jonathan Edwards the third, Dr. Witherspoon—a member of the continental congress, and a signer of the declaration of independence, the fifth; Dr. Maclean, the tenth, yet lives, venerable in years and honored for his lifelong efficient and varied service in the college. Dr. James McCosh, from Queen's college, Belfast, Ireland, the present head of the institution, elected 1868, has greatly advanced its interests by his distinguished reputation, able instructions, and skillful administration. During his presidency the faculty has been enlarged, and the number of students greatly increased; commodious and elegant buildings have been erected, new studies introduced, the school of science established, and more than $2,200,000 contributed for various objects designed to increase the efficiency of the college. Of this sum $1,356,000 was given by Mr. John C. Green and by his legatees, since his death, in carrying out his wishes. Among the other large donors are Messrs. N. N. Halstead, Robert Bonner, Henry G. Marquand, William Libby, R. L. and A. Stuart, James Lennox, and John J. Blair. The college year is divided into three terms. A part of the very complete curriculum of studies is elective during the junior and senior years. There is a large number of prizes, scholarships, and fellowships, the winners of the last are required to pursue a prescribed course of study for one year after graduation. The faculty consists of the president,—who, in addition to his charge of some other departments of instruction, is professor of Biblical instruction,—30 other professors, with 8 tutors and other instructors. During the current year, 1883–84, there were 8 fellows, 55 post-graduates, 100 seniors, 103 juniors, 99 sophomores, 68 freshmen, 86 in the school of science, and 15 "specials;" making a total of 534. The American whig and Cliosophic literary societies have for more than a century added greatly to the fame, attractive power, and usefulness of the college. The college and society libraries contain nearly 60,000 volumes. The whole number of graduates is more than 5,000, among whom have been many distinguished and useful men both in church and state. The campus forms a large quadrangle, fronting on the main street of the town, and is ornamented with many fine and venerable trees. The principal buildings are Nassau hall—twice ravaged by fire and rebuilt, East and West colleges, Whig and Clio halls, marking the administration of president Carnahan; the Halsted observatory, gymnasium, Dickinson, Reunion, Witherspoon, Edwards, and Murray halls; school of science, library, new observatory, and the Marquand chapel now being built. There are also commodious residences for the president and many of the professors.

NEW JERSEY TEA. See RED ROOT, *ante*.

NEW JERUSALEM CHURCH. See SWEDENBORGIANS, *ante*.

NEW JOHORE', formerly Tanjong Putri, a Malay settlement on the southern extremity of the Malay peninsula. Here the rajah or tummongong of Johore, who is an independent sovereign, occasionally resides. The climate is healthy; large quantities of gambir and pepper are raised in the vicinity; saw-mills on an extensive scale are in operation. Vessels of the largest draught can approach close to the shore. The valuable timbers of these immense forests are yet scarcely known, but must find their way to the Indian, if not European markets ere long. Pop. in the New Johore territory about 20,000, chiefly Chinese.

NEW KENT, a co. in e. Virginia, having the Broad York river, formed by the union of the Pamunkey and Mattapony rivers, for its n.e. boundary; and the Chickahominy river for its s. and s.w. boundary; 270 sq.m.; pop. '80, 5,515—5,501 of American birth, 3,240 colored. It is intersected in the extreme n.w. by the Richmond, York river, and Chesapeake railroad. Its surface is generally level, and largely covered with forests. Its soil is a light sandy loam, and produces wheat, corn, tobacco, and sorghum. Horses, cattle, sheep, and swine are raised. Co. seat, New Kent Court House.

NEW LANARK. See LANARK, *ante*.

NEW LEBANON, a t. in s.e. New York, on the Harlem Extension railroad; pop. '80, 2,245. It is 18 m. from Chatham Four Corners, and 24 m. s.e. of Albany. It includes

the villages of Mount Lebanon, Lebanon Springs, Tildens, New Lebanon Center, West Lebanon, and New Britain. The Shaker village of Mount Lebanon is inhabited by nearly 600 persons owning about 4,000 acres of land, which they industriously cultivate, and store their produce in 8 barns, one of which, built of stone, is 196 × 50 ft., and said to be the best in the country. They live in 8 dwelling houses, and have 26 workshops, 2 seed establishment, saw and grist mills, and manufactories of chairs, brooms, and baskets. A kind of cider apple-sauce is made and largely exported. They are specially occupied in preserving garden seeds and preparing extracts of roots and herbs, the annual production being about 200,000 lbs. They have a laboratory, and a large meeting-house. Lebanon Springs is a summer resort noted for its thermal springs, the largest of which discharges 16 barrels of water per minute, with a uniform temperature of 73°, at all seasons. It supplies what the baths require, and the water-power for 3 mills, which are run the year round. It has a number of first-class hotels. In the town is a factory where thermometers and barometers are made, said to be the first established in the United States. It has also an extensive manufactory of medicines, with a glass-factory under the same management. The manufacture of vinegar is among the industries, and it has 8 churches, public schools, a young ladies' seminary, and 2 newspapers.

NEW LE'ON, one of the states of the Mexican confederation. It is bounded by Tamaulipas, San Luis Potosi, Zacatecas, and Cohahuila; has an area of 23,632 sq.m.; and a pop. of 145,000 whites and mestizoes. The surface is generally mountainous, the soil fertile, and the climate healthy. Lead, gold, silver, and salt are found within its limits. The natural resources of the state have suffered in their development by many military disturbances. The capital is Monterey, and other chief towns are Florida, Saltillo, and Lanares.

NEW LONDON, a co. in s.e. Connecticut, bordering on Rhode Island, and bounded s. by Long Island sound and the Atlantic, and s.w. by the Connecticut river; drained also by the Thames, Yantic, Shetucket, and Quinnebaug rivers; intersected by several railroads, the chief being the Shore Line branch of the New York and New Haven consolidated road, the Stonington and Providence, and the Boston, Hartford and Erie; about 600 sq.m.: pop. '80, 73,137—58,965 of American birth, 1,591 colored. The surface is very hilly, but not rugged; the soil is only moderately fertile; oats, Indian corn, potatoes, and dairy products are the staples; the sloping hills give excellent pasturage for cattle. Extensive granite quarries are found near New London. Water-power is furnished in abundance by the streams, and there are extensive manufactures of cotton and woolen goods, furniture, flour, articles of india rubber, paper, fish oil, and other productions. In former years the inhabitants were in great numbers interested in the whale fisheries. The chief towns are New London and Norwich, the former being the co. seat.

NEW LONDON, a city and port of entry in Connecticut, on the right bank of the river Thames, 3 m. from Long Island sound, 40 m. s.e. of New Haven. It is a rich and handsome town, with a custom-house, 11 churches, academy, public schools, a daily and a weekly paper, 5 banks, several iron-foundries and steam saw-mills, a machine-manufacturing company, a deep, secure harbor, protected by a fort of 80 guns with 20,000 tons of shipping, much of it engaged in the whale fisheries, and railway and steamboat communications. Pop. '70, 9,576. It was settled in 1644, and in 1781 burned by gen. Arnold.

NEW LONDON (*ante*), one of the capitals of New London co., Conn.; about 60 m. s.w. of Providence, and 40 m. s.e. of Hartford; the terminus of the Shore Line division of the New York and New Haven, the New London and Northern, and the Stonington and Providence railroads; connected also with New York by a line of large steamboats; pop. '80, 10,529. The city, on the w. bank of the Thames near its mouth, lies at the foot and on the slope of hills which rise behind it. The harbor is a very fine one, 3 m. in length and of a good depth. It is guarded by fort Trumbull, 80 guns, in which a garrison is constantly maintained by the government. The U. S. navy yard is on the e. side of the river above the city. On the same bank is fort Griswold, in Groton, the scene of a massacre by the British forces under Benedict Arnold in 1781. The town was originally settled by colonists under the lead of a son of gov. Winthrop of Massachusetts. The principal public buildings are the city-hall, custom-house, and court-house. There are 10 churches, 6 or 7 banks, schools and academies, and 2 or 3 hotels, one of which, on the sound, at the mouth of the river, is a very popular summer resort. The chief manufactures are woolen, sewing silks, machinery, and hardware. The people formerly for many years were engaged in the whale fisheries, the source of much wealth: that business declined; but recently many vessels have been sent out to the sealing grounds of Alaska and the South Shetland islands. The number of vessels belonging to the port is not far from 200.

NEW MADRID, a co. in s.e. Missouri, having the Mississippi river for its s.e. boundary, separating it from Kentucky and Tennessee; the Little river for its s.; and drained by White river; 750 sq.m.; pop. '80, 7,694—7,587 of American birth, 1881 colored. Its surface, now diversified by swamps, prairie land, and bayous, was considerably lowered in the central portion by the earthquake of 1811–12, forming a large

lake. It has another lake in the w. portion, and its soil is very fertile. Corn and pork are raised, and there is good pasturage for live stock. Co. seat, New Madrid Court House.

NEW MADRID, a village in s.e. Missouri, settled 1780; on the upper Mississippi river; pop. '80, 712. It is in the township of New Madrid, the co. seat of New Madrid county, 40 m. s.w. of Cairo, Illinois, 280 m, s.e. of Jefferson city, at the terminus of the Little River Valley and Arkansas railroad. It is in the center of a fertile agricultural district, and has an extensive trade by the river in market produce, lumber, and live stock; large cargoes being sent down the river to supply southern markets. It was settled by Spaniards from Louisiana, and has received severe shocks from earthquakes, notably that of 1811, which have destroyed most of the original town. The present village is built principally of wood. It has 3 churches and a newspaper.

NEW MALTON. See MALTON.

NEWMAN, EDWARD, 1801–76; b. England; founded the *Entomological Magazine* in 1833, and the *Entomologist* in 1840. In the latter year he began business as a printer and publisher in London, retiring in 1869. He edited the *Zoologist* in 1843, and the *Phytologist* in 1844. He published a *History of British Ferns*, 1846; *The Insect Hunters, or Entomology in Verse*, 1858; *A Dictionary of British Birds*, 1866; *Illustrated History of British Moths*, 1869; and *Illustrated History of British Butterflies*, 1871. His researches were specially devoted to the study of insects injurious to vegetation.

NEWMAN, FRANCIS, d. 1660; b. England; settled in New Hampshire in 1638, and afterwards removed to Connecticut. He was secretary of New Haven colony in the administration of gov. Theophilus Eaton, and was an assistant in 1653, in which year he went to Manhattan as a commissioner for the colony to demand reparation from gov. Stuyvesant for damages inflicted upon the New Haven people by the Dutch. He was one of the commissioners of the confederation of colonies in 1654 and 1658, and succeeded Eaton as governor in the latter year, retaining the office till his death.

NEWMAN, FRANCIS WILLIAM, brother of John Henry, was b. in London in 1805, and educated at the school of Ealing. Thence he passed to Worcester college, Oxford, where he obtained first-class honors in classics and mathematics in 1826, and, in the same year, a fellowship in Baliol college. This fellowship, however, he resigned; and he withdrew from the university in 1830, at the approach of the time for taking the degree of M.A., declining the subscription to the 39 articles which was required from candidates for the degree. After a lengthened tour in the east he was appointed classical tutor in Bristol college, 1834. In 1840 he accepted a similar professorship in Manchester New college, and, in 1846, his great reputation for scholarship and his general accomplishments led to his being appointed to the chair of Latin in University college, London, which he held till 1863. During all this time he has not only been an active contributor to numerous literary and scientific periodicals, and to various branches of ancient and modern literature, but has also had a leading part in the controversies on religion, in which he has taken the line directly opposite to that chosen by his elder brother, being no less ardent as a disciple of the extreme rationalistic school than John Henry Newman of the dogmatical. These opinions, and the system founded upon them, form the subject of his well-known work, *Phases of Faith, or Passages from the History of my Creed* (1850); and of many essays in the *Westminster, Eclectic,* and other reviews; but he is also the author of very many separate publications. Of these several regard the controversy to which we have referred—as, *Catholic Union; Essays Towards a Church of the Future* (1844); *A State Church not Defensible* (1846); a *History of the Hebrew Monarchy* (1847); *The Soul, its Sorrows and Aspirations* (1849). Others are on political or social topics—as, *Radical Reforms, Financial and Organic* (1848); *The Crimes of the House of Hapsburg* (1851); *Lectures on Political Economy* (1857); *Europe of the Near Future* (1871). A large number are devoted to historical, classical, and scientific subjects, the most important of which are *Contrasts of Ancient and Modern History* (1847); *Regal Rome* (1852); translations into "unrhymed meter" of the *Odes of Horace* (1853), and the *Iliad of Homer* (1856); a treatise on *Difficulties of Elementary Geometry; Handbook of Arabic* (1866); *Orthoepy* (1869), etc. For some years he has been engaged on an English-Arabic Dictionary.

NEWMAN, HENRY RODERICK. See page 889.

NEWMAN, JOHN HENRY, D.D., was b. in London, Feb. 21, 1801, and educated at the school of Dr. Nicholas, at Ealing, whence he passed in 1816 to Trinity college, Oxford, of which college he became a scholar by competitive examination in 1818. Having graduated in 1820, he was elected fellow of Oriel college in 1822, where he attracted the notice of Dr. Whately, and was by him employed in the preparation for publication of his well-known *Treatise on Logic*, and introduced to the editor of the *Encyclopedia Metropolitana*, to which he became a contributor. He was ordained in 1824; and in the following year, his friend Dr. Whately having been appointed head of St. Alban's hall, Newman was by him selected as his vice-principal; but on being named tutor in his own college in 1827, as also public examiner, he resigned the vice-principalship. In 1828 he was presented to the vicarage of St. Mary's, Oxford, in which church the sermons which he delivered at a late period had an extraordinary influence in forwarding the religious movement with which his name is permanently associated. At this period Newman was an earnest antagonist of the Roman Catholic church. He was one of those who

transferred their support from sir Robert Peel to sir Robert Inglis on occasion of the former's introducing the Roman Catholic relief bill; and he was one of the most active in commencing and carrying on the so-called Oxford movement—the great object of which was to counteract as well the Romanizing as the dissenting tendencies of the time, by restoring and bringing into notice what Newman and his friends believed to be the Catholic character of the English church. With this view he commenced, in 1833, the series known as the *Oxford Tracts*, to which he was himself one of the chief contributors; and in 1838 he also became editor of the *British Critic*, which was an organ of the same views, and, in conjunction with Drs. Pusey and Keble, of a *Library of Translations from the Greek and Latin Fathers*. He continued the publication of the tracts up to the 90th number, which was written by himself, and the tendency of which was so distasteful to the Anglican authorities that the heads of houses at Oxford condemned the tract, and the Bishop of Oxford called on Newman to discontinue the publication—a request with which he at once complied The *British Critic* continued for some time longer to advocate the same opinions; but in 1843 that publication also was discontinued; and Newman, who had for some time resided at Littlemore, near Oxford, engaged, in company with some of his more youthful adherents, in study and ascetic exercises, thenceforward confined himself chiefly to his Littlemore residence, and eventually, in Oct., 1845, was admitted into the Roman Catholic church, a step which was immediately followed by the publication of a work on the *Development of Doctrine*, which was intended as an explanation of the process through which the writer's own mind had passed. Soon afterwards Newman repaired to Rome, where, after some preparation, he was admitted to orders in the Roman Catholic church; and in 1848, on his return to England, he established a branch of the congregation of the oratory of St. Philip Neri, of which he was himself appointed the superior. In 1852 he was appointed rector of the Catholic university established in Dublin, an office which he held for five years, afterwards returning to Birmingham, where he still resides, and in connection with which he has established a school of higher studies for the youth of the Roman Catholic religion. Dr. Newman, in addition to the large share which he had in the publications already named, is the author of several very important works, written as well before as after his withdrawal from Anglicanism. Of the former period are his *History of the Arians; Prophetical Office of the Church; The Church of the Fathers;* an *Essay on Miracles;* a *Translation of the Treatises of St. Athanasius*, with many learned dissertations, and several volumes of sermons. To the latter period belong the *Development of Christian Doctrine; Lectures on Catholicism in England; Apologia pro Vitâ Suâ; Letter to Dr. Pusey; Essay on Assent;* and *Letter to the Duke of Norfolk on Mr. Gladstone's Expostulation* (1875). Newman is also the author of two religious tales, *Loss and Gain* and *Callista*, and of some fine hymns. He was made a cardinal deacon of the church in 1879.

NEWMAN, John P., D.D., b. New York, 1826; educated at Cazenovia seminary, and entered the ministry of the Methodist Episcopal church. He was for some years pastor of the Metropolitan church of that denomination in Washington, and was chaplain of the U. S. senate, 1869–74. Gen. Grant sent him to Asia as an official inspector of consulates, and he has published a couple of books of travels, describing his oriental tour. Dr. Newman was pastor of a church in New York, 1881–84.

NEWMAN, Samuel, 1602–1663; b. England; educated at Oxford, graduated in 1620, and became a minister of the established church. In 1636 he came as a Puritan to Dorchester, Mass., remaining there about a year and a half, when he removed to Weymouth, being settled there five years. In 1644 with several members of his church he went to Seconet, then a small settlement, and established a church, founding a community out of which grew the town of Rehoboth, formerly including Seekonk and Pawtucket. He is called "the first minister of Rehoboth" where he continued his labors till his death. His *Cambridge Concordance*, a valuable work, was first published in 1643, a new addition appearing in Cambridge in 1683, and a fifth much improved edition was published in London, 1720.

NEWMAN, Samuel P., 1796–1842; b. Mass.; son of Mark H., the publisher; graduated at Bowdoin college, class of 1816. In 1824 he accepted the chair of professor of rhetoric and oratory in the same institution, remaining there fifteen years, when he was appointed superintendent of a state normal school which position he held at the time of his death. He published *Elements of Political Economy, The Southern Eclectic Readers*, and a *Practical System of Rhetoric*, the latter reaching sixty editions in this country and in Europe, and six editions in London. His works have received the approval of some leading educators.

NEWMARKET, a market-t. of England, famous for its horse-races, is situated in a valley 13 m. e.n.e. of Cambridge, and is partly in the county of that name and partly in Suffolk. It contains many well-built and elegant houses, the residences in many cases of gentlemen who are drawn hither from their interest in the *turf*. The market-house and the famous jockey club are the chief edifices. Malt-making and brewing are carried on to some extent; but the town owes its prosperity to the horse-races, and nearly the half of the population are jockeys, grooms, trainers, or stablemen. The race-course of Newmarket, owned partly by the jockey club, and partly by the duke

of Rutland, is said to be the finest in the world, and the training-ground bears a similar character for excellence. There are seven race-meetings held here annually. See HORSE-RACING. The population in 1881 was 5,160.

NEW MEXICO, a territory belonging to the United States, formerly a state of Mexico, in lat. 31° 22′ to 37° n., long. 103° to 109° 9′ w., 350 m. from e. to w., and 350 to 400 from n. to s., with an area of 121,201 sq. miles; bounded n. by the state of Colorado; e. by the Indian territory and Texas; s. by Texas and Mexico; and w. by Arizona. Its chief towns are Santa Fé, Albuquerque, Taos, Silver City, Mesilla. Its chief rivers are the Rio Grande, which crosses the territory from north to south; the Pecos, a branch of the Rio Grande; the Colorado, on the California boundary; the Gila, which rises in the Rocky mountains, and flows westward into the Colorado. These rivers and their branches water broad and fertile valleys, and supply the lack of rain by irrigation. Two great chains of the Rocky mountains or Cordilleras pass through the eastern portion of the territory from north to south, and lesser mountain-ranges diversify the west, rising to elevations of 12,000 feet. The climate is cold in the elevated regions, hot in the plains, but everywhere dry and healthy. Heavy rains fall in July and August, but the rest of the year is dry. The productions are wheat, maize, fruits, and tobacco, with abundant pasturage. There are numerous mines of gold, silver, copper, iron, and salt. Merchandise is transported from St. Louis and Texas in wagon or mule trains. The Indian population consists of 25,268 who sustain tribal relations, and 1309 out of these relations—total, 26,577. The tribes are the wild and predatory Navajoes, Apaches, Utahs, Comanches, etc., who possess large herds of horses, and make perpetual war upon the neighboring settlements. This territory was explored by the Spaniards in 1537, who opened mines, established missions, and made some progress in civilizing the natives. In 1846, Santa Fé, the capital, was taken by an American expedition under gen. Kearney. At the close of the war in 1848 New Mexico was ceded to the United States, and erected into a territory in 1850. White population in 1870, 90,393.

NEW MEXICO (*ante*). Since this territory came into the possession of the United States by the treaty of Gaudalupe Hidalgo, it has always been considered a region of promise both in respect to its physical conditions and its natural resources. In 1850 it was organized as a territory; and three years later the region south of the Gila river known as the Gadsden purchase was obtained through another treaty with Mexico and annexed. The territory then contained, besides the region within its present limits, the whole of Arizona and a portion of Colorado and Nevada. But in 1861 a tract of about 14,000 sq.m. east of the Rocky mountains, between the 37th and 38th parallel was annexed to Colorado; and in 1863 Arizona was set off. New Mexico is now divided into 13 ccunties and the government is established upon the ordinary model of territorial governments; that is, the executive power is administered by a governor and secretary, appointed by the president with the consent of the senate for four years, and by an auditor, treasurer, adjt.gen., and atty.gen. chosen by the territorial legislature. The capital, Santa Fé, is next to St. Augustine, Fla., the oldest town in the United States. The population of the territory has been steadily increasing during the past ten years. Of the total population in 1880, 100,773 were natives and 7.948 of foreign birth, 58,655 males and 50,066 females. Until within the past six or seven years, however, the south and west portions of the territory have been subject to Indian incursions which have kept settlers back. The tribes—namely, the Navajo, Apache, and Pueblo, are now confined to their reservations, and numbered, in 1883, 7,154,525. Pop. '80, 118,430; '84, 150,000. Area, 122,000 sq.m.

Like Colorada and Nevada, the chief inducements New Mexico offers to those already located within its boundary or to emigrants are its dry and healthful climate and the resources of its mines. In the southern part of the territory the temperature is mild, being seldom below the freezing point, and rarely rising to extreme heat, owing to the elevation of the surface. The sky is usually clear and the atmosphere so dry that meat can frequently be preserved a long while without salt. Iron and steel also rarely rust, though exposed continually day and night. Inflamations and typhoid fevers occasionally prevail in the winter season; but pulmonary diseases are rare and malaria does not exist. The mines of the precious metals, copper, lead, iron, and salt have never been so successfully worked as they might have been, had not the Indians molested their regions. These Indians, however, during the past three or four years have gradually been removed, and new mines now are being opened in many directions. The oldest mining districts are the Old and New Placers, Pinos Altos, Arroya Hondo, Cimmaron, Mangano and Moreno, tracts in the Organ mountains, and also in the Sierras Blanca, Carriza, and the Magdalena mountains. The most available of all these that contain gold are those of the New Placer district which are about 38 m. from Santa Fé. Silver is not now largely mined, but there are deposits of it at Pinos Altos and in the Magdalena mountains. Copper also is found in these regions, and one mine in the first named has yielded as high as 9,000 lbs. of metal a week. Lead occurs in the Pinos Altos mines, in the Organ mountains, and elsewhere. Iron and salt are abundant in several districts throughout the territory. The amount of gold from New Mexico deposited at the United States mints and assay offices to June, 1884, was $1,950,546; silver $4,914,811. In 1883

the gold mined was valued at $280,000 ; silver, $2,845,000 ; tons of coal mined, 221,270. The principal reduction of ores is carried on at Socarro, Lake valley, Silver city, and Georgetown.

About 8,000,000 acres are suited to cereals, vegetables, and fruits, the valleys of the Rio Grande and Rio Pesos being important agricultural regions, the former expanding in places to 10 or 15 m. The land is very productive, and but for somewhat primitive modes of cultivation would yield sufficient crops to supply home consumption. Irrigation is employed in many places. In 1880 there were 5,053 farms and 237,392 acres of improved land. Among the products, 1880, were : hay, 7,650 tons ; potatoes, 21,883 bush. ; wool, 10,500,000 lbs. ; butter, 44,827 lbs. In 1884 : wheat, 930,000 bush. ; corn, 950,000 bush. ; oats, 252,000 bush. The ordinary cereals all grow sufficiently well in the territory ; but wheat, maize, pumpkins, onions, and beans afford the principal supplies of vegetable food. The land and the climate are especially suited for the cultivation of the apple, peach, melon, apricot, pomegranate, fig, and the grape. The European vine grows here in the open air, and the wine that is made from it is considered particularly rich. In 1870 there were manufactured 19,686 gallons. Stock raising, and particularly wool-growing, however, have been for many years the chief occupations of the natives ; and for these pursuits the mildness of the climate and the large tracts, where agriculture is not practicable, afford exceptional opportunities. Neither shelter nor hand-feeding is required for the flocks. The valleys, foot-hills, and table-lands are covered with nutritious grasses throughout the year, which provides abundant grazing. The estimated value of the live-stock in the year 1883 was $23,424,835 ; and the stock consisted of 17,139 horses ; 10,183 mules and asses ; 16,743 milch cows, and a total of 690,562 other cattle ; 4,435,200 sheep ; and 23,353 swine.

The number of manufacturing establishments of all kinds throughout the territory, in 1880, was 144, which were chiefly flouring and grist mills, and saw mills and quartz mills. They employed about 557 hands, and the estimated amount of capital invested was $463,275 ; amount of raw material used, $871,352 ; and the value of annual product, $1,284,846. There were, in 1884, 8 lines of railroad, operating 1,140 m. They were the Atlantic and Pacific, connecting with the roads of the Pacific coast ; Denver and Rio Grande ; Atchison Topeka and Santa Fé, with the three roads owned by it ; New Mexican ; New Mexico and So. Pacific ; Rio Grande Mexico and Pacific ; Silver City Deming and Pacific ; So. Pacific of New Mexico. It was estimated in the governor's report for 1884, that in 10 years' time there would be $10,000,000 worth of taxable r.r. property. The value of assessed taxable property in the territory, in 1883, was $27,137,903. The receipts in 1882 were $96,121 ; expenses, $120,006. The territorial tax is 11.25 mills. Three mills of this is for school purposes. There is also a small license-tax on a few trades and occupations. Able-bodied men pay a poll-tax of $1.00 which is applied to school purposes. The militia is composed of one regiment of cavalry and two of infantry. A few schools were established as far back as 1822 by the Mexican authorities, but the system was never effective ; and after the conquest by the United States no public schools were again established until 1872. In 1880, 162 schools were reported in operation with 4,755 pupils enrolled. There were in 1884, 6 academies and colleges for secondary instruction ; of these 4 were Roman Catholic, three nonsectarian, or Congregational, and one Presbyterian. The Mexican element of the population is the chief obstacle to progress. The denominations represented are Baptist, Congregational, Methodist, Presbyterian, Protestant Episcopal, and Roman Catholic. The number of newspapers in 1880 was 18.

Of important events in the recent history of the territory, mention should be made of the completion in 1875 of the United States military telegraph from Santa Fé to Mesilla, and in 1876 from Mesilla to Tucson, Arizona. During the same year the Denver and Rio Grande railroad also was completed nearly to the territorial line at Trinidad, and direct telegraphic communication was extended to San Diego, Cal., and to El Paso, Mexico.

NEW MILFORD, a t. in Litchfield co., Conn., on the Housatonic river and railroad, 14 m. n. of Danbury, and about 40 m. s.w. of Hartford ; pop. '80, 3,907. There are 5 churches, 2 banks, a weekly newspaper ; and paper, boots, buttons, hats, and tobacco are manufactured. The village is well laid out, and the streets are shaded with fine elms and surround a handsome common. The place is to some extent a summer resort.

NEWNHAM COLLEGE : see CAMBRIDGE UNIVERSITY..

NEW ORLEANS, capital city and port of entry of Louisiana, on the left bank of the Mississippi river, 100 m. from its mouth, lat. 29° 58′ n., long. 90° west. The city is built on the alluvial banks of the river, on ground lower than the high-water level, protected from inundations by the *levee* or embankments, which extend for hundreds of miles on both banks of the river. The streets descend from the river bank to the swamps, and the drainage is by canals which open into lake Pontchartrain, which is on a level with the gulf of Mexico. The city is long and narrow, extending about 6 m. along the river, on an inner and outer curve, giving it the shape of the letter S. The older portion, extending around the outer curve, gave it the name of "the Cresent City." New Orleans is the great port of transhipment for a large portion of the cotton crop of the southern American states, the sugar crop of Louisiana, and the produce of the vast region drained by the Mississippi and its tributaries. It commands 10,000 m. of steamboat navigation, and is the natural entrepôt of one of the richest regions of the world. In the fiscal year

ended June 1874, the value of imports into New Orleans was 14,533,864 dollars; of exports, the value was 93,715,710 dollars. The sugar product in 1873 was 103,241,119 lbs., value 8,122,575 dollars. The custom-house is one of the largest buildings in America. The hotels, theaters, and public buildings are on a magnificent scale. There are a branch mint, 55 hospitals, infirmaries, and asylums, several colleges, Roman Catholic cathedral, 150 churches, 7 daily newspapers, extensive cotton-presses, cotton and sugar warehouses, several banks, and all the facilities for a vast commerce. Besides the great river, New Orleans has railways connecting it with the north, east, and west. It is a beautiful, and, but for the very frequent visits of the yellow fever, a healthy city. The visitation of this dreaded epidemic in the lower Mississippi valley in 1878 was one of the most terrible on record. The soil is full of water, so that no excavations can be made. The largest buildings have no cellars below the surface; and in the cemeteries there are no graves, but the dead are placed in tombs, or "ovens," above ground. New Orleans was settled by the French in 1718; with Louisiana, it was transferred to Spain in 1763; soon after re-transferred to France, and sold, with a vast territory drained by the Mississippi and Missouri, by Napoleon I. to the United States in 1803. In 1815 it was successfully defended against a British army, under gen. Packenham, by gen., afterwards president, Jackson. In 1860, Louisiana having seceded from the union, New Orleans became an important center of commercial and military operations, and was closely blockaded by a federal fleet. An expedition of gun-boats, under commander Farragut, forced the defenses near the mouth of the river, April 24, 1862; the city was compelled to surrender, and occupied by gen. Butler as military governor. In 1803, on its cession to the union, the population was about 8,000, mostly French and Spanish; in 1820 it had increased to 27,000; in 1860, to 168,823, and consisted of Americans, French creoles, Irish, etc.; in 1870 it was 191,418.

NEW ORLEANS (*ante*), in magnitude and population, is the ninth city in the United States, and in the value of its exports and foreign commerce ranks next to New York. It comprises about 40 sq. m., one-half of which is closely inhabited, while the rest is barely redeemed from being a swamp. In general appearance it is a mélange of French and American taste, most of the streets running parallel with the Mississippi river present an unbroken line from the lower to the upper limits of the city, a distance of 12 m.; and those at right angles to these extend from the river to the lake. Those in the newer portions of the city are wide, bordered with trees, and have an attractive appearance; and Canal street, the chief thoroughfare, has many handsome stores and private residences. There are 11 public parks and squares, 3 canals for commercial purposes, 10 or 12 for drainage, and 16 markets. Though the city is not notable as a whole for either the beauty or grandeur of its architecture, it has several public buildings that are conspicuous exceptions—the custom-house, the branch mint, the post-office, the city hall, and the St. Charles hotel. Besides these, mention should be made also of the state-house, the university buildings, the charity hospital, the marine hospital, and the Hôtel Dieu, as well as several churches, of which there are 159 in all. In 1861, when the city had attained its greatest commercial prosperity, it received and handled 2,255,448 bales of cotton and 460,000 hhds. of sugar. Since the war its business and prosperity have been much disturbed by political agitation, and by two or three severe visitations of the yellow fever. Nevertheless, during the years 1878–80 its export trade showed a fair increase, and its imports held a steady bulk, though showing a decline in valuation. The imports in 1877 were $11,340,900; in 1878, $8,725,751; in 1884, $10,784,561. The exports for the same years were $70,270,593; $74,366,388; $81,630,030. In consequence of recent navigation improvements, allowing ships of greater burden to come to its wharves, it is believed that the future commerce of New Orleans is to be greatly increased. In the line of manufactures the city can make little claim. Although in 1880 it contained 915 "manufacturing establishments," many of them were scarcely worthy of designation, being principally small manufactories of cotton-seed oil, syrup, and oil, soap, sugar refineries, distilleries, and breweries. Of the other business corporations at that time, there were 8 dry-dock companies and 42 insurance companies, 23 banking institutions, 5 tow-boat companies, and 24 custom-house warehouses. The administrative officers of the city are a mayor and 7 officers known as administrators, who hold their offices two years, together with a board of health, a city surveyor, city attorney, and school superintendent. The police are sort of a mounted state militia, rather than a metropolitan organization, and are under the control of the governor of the state. According to the census of 1880 the assessed value of the real and personal estate was $91,794,350. The total taxation not national was $2,870,370, and the public debt of the city was $17,736,509. There were 36 newspapers. The public schools, of which there were about 54, are under state control, although the city provides for their support. Other educational institutions are the university of Louisiana, N. O., Leland, and Straight universities, a dental college, and the Jesuit college. Most of the French, Italian, Spanish, and Irish population is Roman Catholic; the American and German residents are chiefly Protestants. There are 35 Roman Catholic churches; 35 Baptist; 11 Protestant Episcopal; 7 Evangelical Protestant; 1 Greek; 5 Lutheran; 21 Methodist Episcopal; 21 Methodist; 11 Presbyterian; 6 Congregational; and 1 Unitarian, and 5 Hebrew synagogues. In conclusion it may be said that, although New Orleans is usually believed to be an unhealthy city to reside in, a care-

ful comparison of its vital statistics with those of other cities, not only in the United States but throughout the world, shows that on the whole it is not exceptionally unhealthy. Since the epidemic of 1878 vigorous sanitary improvements have been in progress. The temperature is rarely in the extreme, the average maximum for the year being 83.7° Fahr., the average minimum 51.8°, the general average about 67°. Pop. '80, 216,090.

NEW ORLEANS EXHIBITION. See page 889.

NEW PHILADELPHIA, a village in e. Ohio, on the Tuscarawas river, near the Ohio canal; pop. '80, 3,070. It is in Goshen township, 100 m. by rail s.e. of Cleveland, 24 m. s.w. of Canton, 98 m. n. of Marietta, and 100 m. w. of Pittsburg. It is the e. terminus of the Cleveland and Pittsburg railroad, and is a junction of the Cleveland Tuscarawas Valley and Wheeling, and the Marietta, Pittsburg and Cleveland railroads. It is in the midst of the Tuscarawas bituminous coal and iron region, and the country abounds in coal and iron ore. It has 7 churches, 4 banks, one of them national, good public schools, and 3 newspapers. Its leading industries are the manufacture of woolen goods, agricultural machines, lumber, flour, salt, matches, carriages, paper, boilers, etc.

NEW PHILIPPINES. See CAROLINE ISLANDS.

NEWPORT, a parliamentary and municipal borough, market-town, and river-port of England, chief town of the Isle of Wight, and situated near the center of that island, on the Medina, which is navigable up to this point. St. Thomas's church, founded in 1854, on the site of an ancient structure built in the reign of Henry III., is a handsome edifice, and contains a monument erected by her majesty in memory of the princess Elizabeth, daughter of Charles I., who died at Carisbrooke castle, Sept. 8, 1650. Among the educational establishments of Newport is the free grammar school, in which frequent meetings and negotiations between Charles I. and the parliamentary commissioners took place. About a mile n. of Newport is Carisbrooke castle, where the king was confined under the guardianship of col. Hammond for twelve months (1647–1648). There are several important institutions in the vicinity, as the Albany barracks, the house of industry, and the Parkhurst prison for juvenile convicts. Manufactures of lace are carried on to some extent. Vessels of considerable tonnage can ascend to the quay at high tides. Pop. '81, 9,430.

NEWPORT, a thriving market-town, parliamentary and municipal borough, and river-port of England, in the co. of Monmouth, and 24 m. s.s.w. of the town of that name, on the Usk, and about 4 m. from the mouth of that river. It was anciently the port of the city of Caerleon, about 3 m. further up the river; but during the present century, it has become a shipping port of considerable importance, being the outlet of the produce of the extensive collieries, and iron and tin works of the neighborhood. It possesses a number of recently-erected public buildings, has spacious docks, manufactures nails and spikes extensively, exports iron and coal largely, and carries on an excellent general trade. In 1875, 10,243 vessels, of 1,100,891 tons, entered and cleared the port. Newport unites with Monmouth and Usk in sending a member to parliament. The remains of Newport castle are now used as a brewery. Pop. '81, 35,382.

NEWPORT, a co. in s.e. Rhode Island, having the state line of Massachusetts for its e. boundary, and Acoakset river flowing from Watuppa pond to the sea. It consists of several islands, Rhode island, Canonicut, Goat, and others of less dimensions, besides the portion of the mainland separated from Rhode Island by the e. passage of Narragansett bay; 100 sq.m.; pop. '80, 24,180—19,539 of American birth, 1129 colored. It is intersected by the Old Colony and Newport railroad, terminating at Newport. Prudence island is included in its territory, and Block island lying s.w. in the ocean. Its surface is much diversified by hill, valley, and stream, and is noted for pleasing scenery and beautiful drives. It contains beds of anthracite coal. Its soil is fertile and produces grain, great quantities of apples and other fruit, dairy products, and wool. Clams are dug along the shore, a lucrative business in the summer. Live stock is extensively raised. It contains Fort Adams and the fashionable summer resort of Newport. Its leading industries include the manufacture of flour, fish oil, copper ware, cotton goods, cotton and woolen machinery, carriages, upholstery, and shipping. Co. seat, Newport.

NEWPORT, a city of Kentucky, United States, on the Ohio river, opposite Cincinnati, and on the e. side of the mouth of the Licking river, opposite Covington. It contains a U. S. arsenal, and several iron foundries and rolling mills. Pop. '70, 15,087.

NEWPORT (*ante*), the co. seat of Campbell co., on the Kentucky Central, and Louisville, Cincinnati and Lexington railroads; pop. '80, 20,433. It is built on a high plain; the streets are regularly laid out, and ornamented with shade trees. A bridge over the Licking river connects it with Covington. It is connected by street railroads with Cincinnati, Covington, Dayton, and Belleview. There are many manufactories, foundries, and rolling mills. It has a number of churches, public schools, a U. S. arsenal, banks, a tri-weekly and a weekly newspaper.

NEWPORT, a city and port of entry, and semi-capital of Rhode Island, United States, on the w. shore of the *island* of Rhode Island in Narragansett bay, 5 m. from the ocean. Lat. 41° 29′ n., long. 71° 19′ 12″ west. It has a deep, excellent harbor, defended by forts Adams and Wolcott. It has a state-house, custom-house, market, the Redwood library, many large hotels, and elegant villas; it is renowned for fine scenery and sea-bathing; and is one of the most fashionable watering-places in America. The town also contains

cotton and other manufactures. It was settled, in 1638, by 17 adherents of Roger Williams, who followed him in his banishment from Massachusetts. In 1874 Newport had 135 sailing and steam vessels, of 8,660 tons. It was for a time the residence of bishop Berkeley. Pop. '80, 15,693.

NEWPORT (*ante*) is defended by fort Adams, 3¼ m. distant, the third strongest fortress in the United States. The state house fronting Washington square, through which Washington passed to meet Rochambeau, was built in 1742. The Jewish synagogue on Touro street, built in 1762, was the first in this country. Judah Touro, a son of one of its pastors, gave to the city Touro park, on which stands the "Round Tower" or "Old Stone Mill," a circular stone tower with round arches. A Norse origin has been ascribed to it, but Palfrey, in his *History of New England*, has pretty conclusively shown that it was an old colonial wind-mill. Near the old mill is a statue of commodore M. C. Perry. Trinity church, on Church st., has an organ presented by Berkeley. On Clarke st. are the central Baptist church, founded in 1733, the armory of the Newport artillery company, formed in 1733, and the Vernon house, Rochambeau's headquarters in 1780. Franklin's printing-press, imported in 1720, is still in the office of the *Weekly Mercury*, founded in 1758. The fashionable drive of Newport is Bellevue ave., a broad street 2 m. long. There is excellent surf bathing off the First beach; the Second, or Sachuest beach, is a favorite riding-course. Old Newport, with many colonial mansions and narrow streets, is almost surrounded by the new town. Aside from the bathing, boating, and driving facilities of Newport, its chief attraction is its equable climate. The city is connected with Boston by the Old Colony and Newport railroad, and with New York by the Shore line, 67 m. from Boston, 180 m. from New York; pop. 15,693. The daily steamers of the Fall River line to New York touch here. Steamers run daily to Providence and Rocky Point. Newport harbor was visited by Verrazzani in the 16th c., and by several subsequent English explorers. It was settled in 1639 by a party of colonists, adherents of Roger Williams, under William Coddington. Its relative importance a century ago was much greater than now. Its population in 1774 was 12,000, and its commerce next to Boston, and much larger than that of New York. It was captured in 1776 by the British, who held it till 1779. The next year a French fleet having on board the count de Rochambeau and 6,000 French soldiers, arrived at Newport. President Adams founded a naval station there, and the torpedo division of the U. S. naval service, with a school for the instruction of young officers in the torpedo service, is situated on Goat island. Among the historical names of Newport are dean Berkeley, who came to Newport in 1729 to found a university for the conversion of the Indians, built a house called "Whitehall," about 3 m. from the city, and returned to England in 1731, dividing his Newport estate between Harvard and Yale colleges; Drs. Samuel Hopkins and Ezra Stiles, the latter afterwards president of Yale; and William Ellery Channing, who was born 1780, in the Channing mansion, built 1720, on Thames street.

NEWPORT, CHRISTOPHER, b. England, about 1565; commander of the vessels which brought over the Jamestown colony in 1606, and a member of the council for the government of that colony. Returning to England after a visit with capt. John Smith to Powhatan, he brought over 120 additional emigrants in 1608. Near Richmond he found some yellow mica, with which he loaded his vessels, supposing it to be gold. He came over with lord Delaware in 1610, was wrecked at the Bermudas, and returned to England in 1612. He wrote *Discoveries in America.*

NEWPORT-PAGNELL, a small market town in England, in Buckinghamshire, on the Ousel, 50 m. n.n.w. of London. Lace is manufactured extensively, and there is a good trade in corn, coal, and timber. Pop. '81, 3,686.

NEW PROVIDENCE, one of the Bahama islands, between Eleuthera and Andros, in lat. 25° 5′ n.; long. 21° 77′ w., 17 m. long by about 7 wide; pop. 9,000. The surface is broken with hills, but some parts are fertile. Nassau, the capital of the island, is on the n. coast. New Providence was originally an English colony, founded in 1629, was twice captured by Spain, and definitely given back to England by the peace of 1783.

NEW RED SANDSTONE. A large series of reddish colored loams, shales, and sandstones, occurring between the carboniferous rocks and the lias, were grouped together under this name, in contradistinction to the old red sandstone group, which lies below the coal-measures, and has a similar mineral structure. Conybeare and Buckland proposed the title Poikilitic (Gr. variegated) for the same strata, because some of the most characteristic beds are variegated with spots and streaks of light-blue, green, and buff on a red base. In the progress of geology, however, it was found that two very distinct periods were included under these names; and the contained fossils of each group were found to be so remarkably different that the one period was referred to the paleozoic series, under the name of permian (q.v.), while the other, known as the trias (q.v.), was determined to belong to the secondary series.

NEW RICHMOND, a village in s. Ohio, on the e. bank of the Ohio river; 20 m. s.e. of Cincinnati; pop. '80, 5,045. It is in Ohio township, Clermont co., which is the chief town in respect to population and active trade in the county. It has 8 churches, good public schools, a newspaper, a national bank, a loan and fund association, and a town-

hall. Its leading industries are the manufacture of chairs and woolen goods; and it has steam, saw, and grist mills, distilleries, tobacco factories, foundries, and breweries.

NEW ROCHELLE, a t. in s.e. New York, on Long Island sound, at the junction of the Harlem River branch railroad with the New York, New Haven, and Hartford; 18 m. from New York; pop. '80, 5,276. It contains many beautiful residences and is a favorite resort from the cities of the vicinity. It has 7 churches, good schools, a savings bank, 5 hotels, 2 weekly newspapers, a variety of stores, and an establishment for the manufacture of scales.

NEW ROSS, a seaport and parliamentary borough of Ireland, situated on the estuary of the Barrow, partly in the county of Kilkenny, but chiefly in that of Wexford, distant 84 m. s.s.w. from Dublin. It is an ancient town, having been surrounded by walls about the middle of the 13th century. Before the union, it returned two members to parliament, of whom one was withdrawn by the act of union. It is now a place of considerable commerce, and the modern part of the town on the Wexford side is built with great regularity and taste. On the Kilkenny side is a straggling suburb called Rosbercon, connected with New Ross by a metal bridge, erected at a cost of £50,137, which has a swivel-pillar in the center, to allow vessels to pass; formerly the connection was by a wooden bridge, nearly 700 feet in length. The port is approachable at spring-tides by ships of 800 tons, and at all times by vessels of 600 tons; and there is a communication by river and canal with Dublin, and also with Limerick. The town is managed by a board of 21 commissioners. It possesses no manufactures of any importance. Pop. '81, 6,626.

NEW RUSSIA. See RUSSIA.

NEW RUTLAND, a t. in n. Illinois, in the extreme s.e. of La Salle co.; pop. '70, about 1,129. It is on the Illinois Central railroad, in the township of Groveland, and its railway station is called Rutland. It has 5 churches, excellent schools, several hotels, and a grain elevator. Its leading industries are the manufacture of harness, furniture, flour, and wagons; and coal is mined in the vicinity.

NEWRY, a seaport and parliamentary borough, situated partly in the county of Armagh, but principally in the county of Down, Ireland, distant from Dublin 63 m. n., and from Belfast 38 m. s.s.w, with both which places it is connected by a branch-railway communicating with the Dublin and Belfast Junction railway. The town is nearly coeval with the English invasion, having grown up around a monastery founded in 1183, and a castle subsequently erected by De Courcey. This castle was the scene of several struggles; and in most of the civil wars of Ulster, Newry suffered severely. It was incorporated as a borough, with a corporation and two members of parliament, by James I. Since the union, it returns but one member, and the corporation having been abolished by the Irish municipal reform act, the affairs of the town are now administered by 21 commissioners. It is traversed by a river of the same name, which falls into Carlingford lough, and by a canal, by which the navigation is prolonged to lough Neagh, a distance of 32 miles. A commission has been appointed for improving Carlingford lough and to remove the bar; the estimated cost being £80,000. The town is handsomely and compactly built. The quays are lined with spacious warehouses, and there are several mills, tanyards, coach and car manufactories, and iron foundries. Extensive waterworks have recently been constructed. Linen, cotton, and iron manufactures are carried on. The income of the port is £6,000 yearly. Steam-vessels ply to Liverpool and Glasgow from Warrenpoint, a port 5 m. distant on Carlingford lough; and the Newry and Greenore railway, connecting the Newry and Armagh line with Carlingford lough, is in progress. Pop. '81, 15,085.

NEW SCHOOL AND OLD SCHOOL PRESBYTERIANS, formerly the names of two great parties, and, 1838–70, of the two principal divisions in the Presbyterian church of the United States. The parties were produced, and the rending of the church was caused chiefly by three forces having unequal degrees of strength, but all tending to one result. These may be here named without being fully discussed:

1. *Differences in theological views.* The Presbyterian church in the United States was, at the beginning, composed in a great degree of emigrants from Scotland and Ireland, and in its growth continued to receive fresh accessions from those lands. These brought with them and long retained theological opinions and practices which, while they may be spoken of in general terms as Calvinistic, had manifest traits peculiar to themselves. Yet they did not escape entirely the modifications to which opinions of every kind have been subjected by the isolation, conflicts, and liberty of discussion and action, that have given character to American government, churches, and institutions of every kind. During this time, theology and practical religion were among the chief factors in developing the New England colonies and states. Doctrines furnished themes for thought and discussion among ministers and people in a degree scarcely equaled, unless among the early Greek Christians and the reformers of the 16th century. No wonder, therefore, that important modifications were produced and embraced. And as many ministers and other members of churches went from New England to the other colonies, and afterward to the new states, these modifications entered into Presbyterian churches, accelerating and increasing the changes there. Many too, from these churches, obtained

their education in New England schools and colleges, a part of them becoming Christians there. Andover theological seminary, preceding that at Princeton by 5 years, instructed a portion of Presbyterian students as well as many from New England who became Presbyterian ministers. This brief statement may show how it was that in the American Presbyterian church, there arose the terms, first of "new side," and "old side," with the division they occasioned, and afterward of "new school" and "old school." The infusion of elements from Congregationalism is traceable.

2. *Differences of opinion concerning church polity and extension.* The early churches of New England were independent and congregational in government, yet were connected together by mutual conference, and, some of them, by associations gradually formed, and having different degrees of strength. But when Congregational ministers and members removed to other colonies, they generally, until comparatively recent years, became pastors and members of Presbyterian churches already established, or united with Presbyterians in forming new ones. The churches of Newark and vicinity, founded by a Connecticut colony, were at first Congregational, but soon became Presbyterian. In 1801 a plan of union was unanimously proposed by the Presbyterian general assembly to the general assoeiation of Connecticut, by whom it was unanimously adopted, with a view on both sides "to prevent alienation, and promote union and harmony in those new settlements which are composed of inhabitants from these bodies." This plan was not only adopted unanimously by the general assembly, but was also for a long time cordially approved by the most eminent ministers in the Presbyterian church. Under the operation of it, and of union with Congregationalists generally, hundreds of the best Presbyterian churches in the land were formed and built up. Yet the polity resulting from the union, like the doctrine embraced, was a Presbyterianism somewhat modified in its usages and forms. This modification entered gradually into the forces which produced the new school and the old school parties. Its chief power, however, was in an element more general than any difference between Presbyterians and Congregationalists alone could have supplied. This was the use of "voluntary societies" in benevolent and missionary work. The country passed through a period, during which many such agencies were formed, chiefly from the necessity for united effort, and partly from want of experience in the work. But as experience and denominational strength increased, conflict between voluntary and more strictly church agencies arose. This conflict entered largely into the development of party spirit between new school and old school Presbyterians.

3. *Differences of opinion and practice concerning slavery and concerning the manner in which it should be treated by Christian churches.* The origin and growth of this difference need not here be traced. It is sufficient to say that it was by far the most powerful of the influences which intensified the party spirit; and that as the region where slavery most prevailed was, because of it, the less subjected to the modifying influences already described, it came to pass that the modified doctrine and polity were found mainly united with opposition to slavery, forming generally new school Presbyterians; and the unmodified doctrine and polity were, in a like degree, united with adherence to slavery, or with silence concerning it, forming generally old school Presbyterians. Without the influence, direct and indirect, of slavery, neither of the other causes, nor both of them combined, would have been strong enough to divide the Presbyterian church; probably not to have caused even a serious attempt to divide it. Reasons for this opinion are found in the fact that after the division the new school part of the church safely outgrew the use of voluntary societies; that just before the reunion the old school portion accepted, as substantially orthodox, the declaration of doctrine made by the new school portion just after the division; that slavery, without auxiliary causes, divided the strong organization of the Methodist Episcopal church; that in the spring of 1861, it divided the old school portion of the church when in "a state of almost unprecedented doctrinal homogeneity;" that it was prevented from rending the national Union itself, only by one of the mightiest conflicts the world has ever known; and that when its power was removed, the process of reuniting new school and old school Presbyterians at once began. At the reunion, agreed to in 1869, and organically effected in 1870, some of the chief statistics were:

	Synods.	Presbyteries.	Ministers.	Churches.	Church Members.	Sunday S. Members.
New School..	22	110	1833	1747	174,626	196,440
Old Schoo...	28	149	2,447	2,859	271,913	254,417

Total amount contributed by both divisions during the year 1869–70, for the support and extension of religion was $8,440,121. See PRESBYTERIAN CHURCH IN THE U. S.

NEW SHOREHAM. See SHOREHAM.

NEW SIBERIA, a group of islands in the Aretic ocean, lying n.n.e. of the mouth of the river Lena, in Eastern Siberia. Lat. 73° 20′ to 76° 12′ n., long. 135° 20′ to 150° 20′ e.; area, 20,480 sq. miles. The principal are Kotelnoi (the largest), Liakov, Fadievskoi, and New Siberia. The coasts are in general rocky, and are covered all the year round with snow.

The islands are very important, on account of the immense multitude of bones and teeth of mammoths, rhinoceroses, buffaloes, etc., which are found in the soil. They are now uninhabited, but there are traces of former inhabitants. Neither bush nor tree is to be seen anywhere.

NEW SOUTH WALES, a British colony in the s.e. of Australia. It originally comprised all the Australian settlements e. of the 135th meridian, but the formation, successively, of the separate colonies of South Australia (1836), Victoria (1851), and Queensland (1859) has reduced it to more moderate dimensions. It is now bounded on the n. by a line which, beginning at Point Danger, in lat. 28° 8′ s., follows several lines of heights across the Dividing Range till it meets the 29th parallel, which forms the rest of the boundary westward; on the w. by the 141st meridian; on the e. by the Pacific ocean; and the line separating it from Victoria on the s. runs from cape Howe, at the s.e. of the island, n.w. to the source of the Murray river, and then along that stream, in a direction w. by n., to the western boundary of the two colonies. Area, 323,437 sq.m., or somewhat less than four times that of the island of Great Britain; pop. '71, 503,981, of whom 275,551 were males, and 228,430 females; '81, 751,468. The more general physical character of the country is described under AUSTRALIA. Within the colony of New South Wales the mountain range, which girdles nearly the whole island, is most continuous and elevated, and is known as the Dividing Range. The section of this mountain system on the southern boundary of the colony, called the Australian Alps, rises in mount Kosciusko to 7,308 feet. From this the range extends northward, the water-shed being from 50 to 150 m. distant from the e. coast, and thus divides the colony into two slopes, with two distinct water-systems. The rivers on the eastern side descend with great rapidity, and in oblique tortuous courses, their channels often forming deep ravines. Many of them are navigable in their lower course for sea-going steamers. The principal are the Richmond, Clarence, McLcay, Manning, Hunter, Hawkesbury, and Shoalhaven. The Hunter river, about 60 m. n. of Sydney, opens up one of the most fertile and delightful districts in the country. The Dividing Range, which, opposite to Sydney, is called the Blue mountains, being singularly abrupt and rugged, and full of frightful chasms, long presented an impenetrable barrier to the west, and kept the colonists shut in between it and the sea, and utterly ignorant of what lay beyond. At last, in 1813, when the cattle were likely to perish in one of those long droughts that appear to visit this country at intervals of a dozen years, three adventurous individuals scaled the formidable barrier, and discovered those downs on the western slope which now form the great sheep-ranges of Australia. A practicable line of road was immediately constructed by convict labor, and the tide of occupation entered on the new and limitless expanse. The numerous streams that rise on the w. side of the water-shed within the colony, all converge and empty their waters into the sea through one channel within the colony of South Australia. The southern and main branch of this great river-system is the Murray. The other great trunks of the system are the Murrumbidgee, which is navigable; the Lachlan, at times reduced to a string of ponds; and the Darling. The Macquarie, passing through the rich district of Bathurst (q.v.), is a large tributary of the Darling, but it reaches it only in the rainy seasons. The coast-line from cape Howe to Point Danger is upward of 700 m. long, and presents numerous good harbors formed by the estuaries of the rivers. Owing to the great extent of the colony, stretching as it does over eleven degrees of latitude, the climate is very various. In the northern districts, which are the warmest, the climate is tropical, the summer heat occasionally rising in inland districts to 120°, while on the high table-lands, weeks of severe frost are sometimes experienced. At Sydney, the mean temperature of the year is about 65°. The mean heat of summer, which lasts here from the beginning of December to the end of February, is about 80°, but it is much modified on the coast by the refreshing breeze. The annual fall of rain is about 50 inches. Rain sometimes descends in continuous torrents, and causes the rivers to rise to an extraordinary height. Sometimes the rains almost fail for two or three years in succession (see AUSTRALIA). The coast, for 300 m. from the northern boundary, is adapted for growing cotton, and in 1868, when a large quantity was grown, the average produce was 180 lbs. per acre; but cotton-planting seems now to have been abandoned. Further s., the climate is more temperate, and is fitted to produce all the grain products of Europe. Immense tracts of land, admirably adapted for agriculture, occur in the south-western interior; while in the s.e. coast districts, the soil is celebrated for its richness and fertility. In the n., the cotton and tobacco plants, the vine, and sugar-cane are grown, and pine-apples, bananas, guavas, lemons, citrons and other tropical fruits are produced. In the cooler regions of the s., peaches, apricots, nectarines, oranges, grapes, pears, pomegranates, melons, and all the British fruits, are grown in perfection, and sometimes in such abundance that the pigs are fed with them. Wheat, barley, oats, maize, and all the cereals and vegetables of Europe are also grown.

Agriculture is thus increasing in importance, though the predominating interest is still pastoral. In 1880–81, there were 39,992 freeholders and lease-holders occupying 27,765,317 acres of land, of which 706,498 acres were under cultivation, 21,351,433 acres inclosed but not cultivated, and the remainder (5,707,386 acres) not inclosed. The largest crops were—wheat (252,540 acres) and maize (125,679 acres). The other crops included oats, barley, rye, potatoes, millet, etc. Considerable attention has been

bestowed on the cultivation of the vine and the manufacture of wine. The produce in 1880–81 was 584,282 galls. of wine and 6,625 galls. brandy, besides 1,575 tons of grapes.

The great produce of the colony is wool, the exports in 1880 amounting to 154,871,832 pounds, valued at £8,040,625. Sheep-farming requires a large capital, together with skill and experience; and the sheep-farmers or squatters form the territorial aristocracy of the colony. All the best pasture land has long been taken up and rented (for periods of 10 to 15 years) from the crown under certain conditions. Stations, or the right of grazing, with the stock on them, are continually advertised for sale; the price of a station is according to the number of cattle or sheep on it. The question of the rent that the "squatters" should pay (which used to be about £10), and of the tenure by which the pasture-lands should be held, was long a source of agitation and bitterness in the colony. They now pay about a farthing a year for each sheep the run can support. According to the present regulations, arable lands are disposed of by two distinct systems of sale—one, to the highest bidder at auction in unlimited quantities; the other, at a fixed price in limited quantities. By this last, known in the colony as "free selection before survey," the intending cultivator can first select for himself, and then secure in fee-simple a quantity not less than 40, and not more than 320 acres, at the rate of 20s. per acre, on condition of residing on his farm, improving a portion of it, and not subletting it.

The coal fields of New South Wales are extensive, and the seams of great thickness. In 1880, 1,466,280 tons, valued at £625,336, were raised. Iron, lead, copper, and oil-shale are abundant. Gold was discovered here in May, 1851, and in that year gold was exported to the amount of £468,336. This amount was increased to £2,660,946 in 1852, but subsequently, owing to the discovery of the richer diggings of Victoria, gold-mining in this colony began to languish. Since 1857, however, the annual amounts found and exported have been steadily increasing; that for 1869 being 234,382 oz., valued at £886,749; and in 1878 the value exported was a little over £423,100. In 1875 there were in the colony 22,872,882 sheep, 2,856,699 cattle, and 346,691 horses. In 1871 the revenue was £4,709,010; the expenditure £4,179,840; in 1883 the revenue amounted to £7,675,536, and the expenditure to £7,418,536. The exports in 1882 amounted to £16,716,261, comprising barley, oats, potatoes, live stock, preserved meat, leather, wool, tallow, coal, gold-dust, and sovereigns; the imports, consisting largely of articles for food and clothing, etc., were £21,281,130. The Sydney branch of the royal mint was instituted in 1855, and issues large quantities of gold in sovereigns and half-sovereigns. There were in 1880 about 750 m. of railway already open in the colony, while about 200 m. additional were in course of construction. There is telegraphic communication between all the important places in the colony, and also with other colonies; length of wire in 1880, 16,000 miles. New South Wales is self-governed, with a governor appointed by the queen, a responsible ministry, a legislative council nominated by the crown, and a house of assembly elected by permanent residents. As regards religion, all sects are on a footing of equality. On Jan. 1, 1876, there were 1089 regular places of worship, affording accommodation to 57,000 Episcopalians, 50,000 Roman Catholics, 24,000 Presbyterians, 44,000 Methodists, etc. The number of schools under the council of education, in 1880, was 1380; besides these there are 530 private schools. There were, in all, 169,000 scholars. For the higher education, see SYDNEY. The capital is Sydney, with a pop. of 220,427; and the other chief towns are Paramatta, Bathurst (q.v.), Goulburn, Maitland, Newcastle, Grafton, and Armidale, with populations ranging from 3,000 to 17,000.

New South Wales took its origin in a penal establishment, formed by the British government in 1788 at Port Jackson, near Botany bay (lat. 34°). The prisoners, after their period of servitude, or on being pardoned, became settlers, and obtained grants of land; and these "emancipists" and their descendants, together with free emigrants, constitute the present inhabitants. Transportation to New South Wales ceased in 1840, and up to that date the total number of convicts sent thither amounted to 60,700, of whom only 8,700 were women. They were assigned as bond-servants to the free settlers, who were obliged to furnish them with a fixed allowance of clothing and food. In 1833 there were 23,000 free males and 13,500 free females, to 22,000 male and 2,700 female convicts; and of the free population, above 16,000 were emancipists. The following table shows the recent rate of increase in the population:

	Males.	Females.	Total.
1850	154,575	110,928	265,503
1861	202,099	156,179	358,278
1881	411,149	340,419	751,468

In 1870–80 N. S. W. adopted free-trade principles; a departure from the usages of the other Australasian colonies, justified by the development of commerce and manufacturing industry.

NEWSPAPER, a periodical publication printed and distributed for the circulation of news. From the broad-sheet relating the most meager intelligence without comment or inference, the newspaper has gradually grown up into a powerful political as well as social engine, diffusing information on all subjects of interest, circulating advertisements, and acting on the public mind, in times of excitement, to an extent that has led it to be called a fourth estate of the realm.

The earliest approach to the newspaper is to be found in the *Acta Diurna*, or *Acta Publica*, of ancient Rome, an official gazette, which in the later times of the republic, and during the empire, appeared daily under sanction of the government. The contents of these *Acta* consisted of an enumeration of the births and deaths in Rome, an account of the money paid into the treasury, and everything relating to the supply of corn; extracts from the *Acta Forensica*, including the edicts of magistrates, the testaments of distinguished men, reports of trials, with the names of the acquitted and condemned, a list of the magistrates who were elected; extracts from the *Acta Senatus*, an account of public affairs and foreign wars, of the births, deaths, festivals, and movements of the imperial family; and generally news relating to public buildings, funerals, games, fires, sacrifices, and miracles, as well as amatory stories. The *Acta* seem to have been drawn up under the superintendence of censors, quæstors, and other magistrates, by officers called *actuarii*, assisted by clerks and notaries; and their publication consisted in posting them in some public place in the city, where they could be read by any one who pleased. They continued to be issued until the downfall of the western empire, but there seems never to have been anything corresponding to them at Constantinople.

The beginnings of the newspaper of modern Europe are traceable to Germany and to Venice. Soon after the invention of printing, in the latter half of the 15th c., small news-sheets, called *Relationen* and the *Newe Zeytung*, appeared in Augsburg, Vienna, Ratisbon, and Nürnberg, generally in the form of a letter. The extant numbers contain, among other matters, accounts of the discovery of America, of the conquests of the Turks, of the French and Austrian war in Italy, with such local occurrences as executions, inundations, earthquakes, burnings of witches, and child-murders committed by the Jews. More important, perhaps, were the official *Notizie Scritte*, first issued by the Venetian government in the 16th c., containing accounts of the wars carried on by the republic, and other events of general interest. At first they were not printed, but were to be seen in various public places on payment of a small coin, called a *gazeta*, whence the name "Gazette." After they were allowed by the government to be printed, they obtained a wide circulation over the whole of Europe.

The earliest English newspaper, or news-letters, belong to the reign of James I., and were printed in the form of small quarto pamphlets. Some copies of a sheet, called the *English Mercury*, purporting to be published by authority of queen Elizabeth in 1588, the period of the Spanish Armada, have been proved by Mr. Watts of the British museum to be literary forgeries, executed about 1766. The first English newspapers appeared at occasional and irregular intervals—the earliest of them, so far as ascertained, is entitled *News out of Holland*, and was published for M. Newbery in 1619. In 1622 these occasional pamphlets were converted into the first *printed* newspaper, entitled *The Certaine News of the Present Week*, edited by Nathaniel Butter. About the same time appeared the *London Weekly Courant*. A large number of publications, hardly deserving the name of newspapers, were circulated during the civil war, with such names as *England's Memorable Accidents*, *The Kingdom's Intelligencer*, *Mercurius Aulicus*, *The Scots Intelligencer*, *The Parliament's Scout*, *The Parliament's Scout's Discovery, or Certain Information*, *The Scots Dove*, *The Parliament Kite*, *The Secret Owl*, *Mercurius Mastix*, *Mercurius Democritus*, *Mercurius Acheronticus, or News from Hell*, etc. The arrangement of the news is poor in the extreme, and what few comments there are, are of the most virulent description. The long parliament subjected the newspaper press to a censorship, which became more strict under Charles II. The first English newspaper which could properly be considered a vehicle of general information, was the *Public Intelligencer*, established by sir Roger L'Estrange in 1663; it was dropped on the appearance of *The London Gazette*, the first number of which was published Nov. 7, 1665, at Oxford, where the court was residing in consequence of the plague being then in London. A second paper, called *The Observator*, was afterwards started by L'Estrange, who, in 1680, exercised his authority as licenser of the press by issuing a proclamation "for suppressing the printing and publishing of unlicensed news-books and pamphlets of news." Small as was the sheet, a difficulty often arose how to fill it. One publisher was in the way of supplying the dearth of news by a passage from the Bible; another announced that "blank space is left that any gentleman may write his own private business."

Up to the reign of queen Anne few of the newspapers appeared oftener than once a week. From the interest excited by Marlborough's victories arose a demand for more frequent intelligence, and besides 17 newspapers published three times a week, the *Daily Courant*, established in 1709, was issued every day except Sunday. Of the more noted London newspapers, the *London Daily Post and General Advertiser* was established in 1726, and in 1752 became the *Public Advertiser;* a celebrity attaches to it from having been the medium in which "Junius's Letters" first appeared. The *St. James's Chronicle* arose from an amalgamation of two papers, the *St. James's Post* and *St. James's Evening Post*, both which began in 1715. The *North Briton*, edited by Wilkes, first appeared in 1762. The *Morning Chronicle*, discontinued in 1862, dates from 1770; the *Morning Post*, from 1772; the now defunct *Morning Herald*, from 1781; the *Times* first appeared in 1788, as a continuation of the *London Daily Universal Register*, established three years earlier.

During the reign of George III. prosecutions were rife against newspaper writers and

editors; their result, generally, was to give a greatly increased currency to the doctrines assailed, and to confer a fictitious importance on the traders in politics, by whom many of the journals were conducted. The first attempt at parliamentary reporting was resented by the house of commons as a breach of privilege, but the resolutions and the imprisonments of 1771 all ended in the tacit concession of publicity of discussion which has ever since prevailed.

The newspapers of Great Britain have, within the present century, greatly increased in size and improved in literary character. In both respects they are far in advance of the journals of any other country. Each number of the *Times* now consists in general of 16 pages, occasionally 24, and contains upwards of 5,000 advertisements. The success of the *Times* is mainly due to the enterprise of its original promoter, Mr. Walter, who first introduced various improvements in the art of printing, and made a strong effort to secure the best literary talent attainable in all departments of his journal. One of the most notable incidents in the history of the *Times*, was the exposure, through means of its Paris correspondent, of a gigantic scheme of forgery, planned in France in 1840—a scheme which contemplated the almost simultaneous presentation, at the chief banking-houses of the continent, of forged letters of credit from Glyn & Co. The failure of the conspiracy was mainly due to the exertions made by the *Times*. One of the parties implicated, brought an action for libel against the printer, and obtained a verdict of one farthing damages. A public subscription was raised to defray the expenses incurred in defending the action; when the proprietors of the *Times*, declining personally to accept the sum subscribed, invested it in two *Times* scholarships in connection with Christ's hospital and the city of London school, for the benefit of pupils proceeding thence to Oxford or Cambridge.

The editing of one of the leading London newspapers involves an immense daily expense, and the co-operation of a number of talented writers. The principal editor, as representative of the proprietors, has the whole oversight and responsibility intrusted to him. He occasionally furnishes the leading article, but it is more frequently composed by one of a staff of literary contributors, who are bound on the shortest notice to write on any subject which the editor may assign. The leader is in form a relic of the time when the newspaper was the news-letter; it is its professed object to analyze, condense, and explain public transactions, to scrutinize what is doubtful or suspicious in the conduct of public men, and to expose sophistry and imposture. Under the editor are various sub-editors, having the superintendence respectively of the London, the provincial, the foreign, the literary, the industrial, and other departments. The commercial article is furnished every evening by a contributor in the city. There are 12 to 16 parliamentary short-hand reporters, who are continually relieving one another, besides reporters attached to the courts of law, and correspondents who furnish accounts of public meetings and local news of various kinds. The foreign intelligence, a most important department in the great London journals, is furnished by correspondents in all parts of the world, some of them, particularly those employed in time of war, being men of very high reputation in the literary world.

A stamp-duty on newspapers was imposed in 1713 by 10 Anne, c. 19, amounting to one halfpenny on "half a sheet or less," and one penny "if larger than a half a sheet, and not exceeding a whole sheet." The duty was raised ½d. by 30 Geo. II. c. 19; another halfpenny was added by 16 Geo. III. c. 34; still another by 29 Geo. III. c. 50; and a further addition of 1½d. was made by 37 Geo. III. c. 90, amounting to 4d. in all. Acts 6 and 7 Will. IV. c. 76, reduced the stamp-duty to 1d., with the addition of ½d. or 1d. when the sheet contained upwards of 1550, or of 2,295 square inches on each side. An additional ½d. was chargeable on a supplement. By 18 and 19 Vict. c. 27, passed in 1855, the newspaper stamp was abolished, a change which occasioned an immense increase in the number of newspapers and diminution of their price, though many of the cheap papers then started were of very brief duration. The repeal of the paper-duty, which took effect on Oct. 1, 1861, also added, though to a much less considerable extent, to the number and cheapness of newspapers. The number of stamps issued on British newspapers was 7,500,000 in 1753, 16,000,000 in 1800, and 65,741,271 in 1850.

In 1843 the number of newspapers published in London was 79 ; in 1880 it was about 340. Eighteen of these are daily papers, 5 of them published in the evening and 1 out of the six a reprint of the morning papers, with what news had been received during the day. Of these, the most influential for 40 years back has been the *Times*, established in 1788, of which nearly 70,000 copies are printed daily, and its circulation has been larger on occasions of public interest. It professes independence in politics. The *Daily News*, *Pall Mall Gazette* (an evening paper), *Daily Telegraph*, and *Morning Post* are the most important liberal daily papers, the last named being also the organ of the fashionable world, while the *Standard* and *Globe* (an evening paper), represent the conservative party.

The price of the daily papers varies fom ½d. to 3d. Of the 648 newspapers not daily, most are published once, some twice, some three times, one four times a week, some once a fortnight, and some monthly. They comprise agricultural, sporting, commercial, and railway journals; a dozen or so purely literary, or literary and scientific; military and naval, musical and theatrical, legal and medical journals. There is a *Court Circular* and a *Court Journal*, a French, a German, an Anglo-American, and a Spanish weekly

paper. There are a few pictorial and about half-a-dozen humorous papers. Of these last, *Punch*, which has been in existence since 1841, is ably conducted, and wields no small influence. A large number are the organs of particular religious sects or parties. The bankers, drapers, grocers, printers, booksellers, brewers, etc., have their respective journals; the builders have six; and there are many newspapers with a purely local circulation, some confined to the obscurer quarters of London. The price of the weekly papers varies from 6d. to ½d. The *World*, *Truth*, etc., are "society papers."

The earliest English provincial newspaper is believed to be the *Norwich Postman*, published in 1706, at the price of a penny, but "a halfpenny not refused." It was followed, in 1714, by the *Norwich Courant, or Weekly Packet*. A *York Courant*, *Leeds Courant*, and *York Journal* were established about 1720; the *Manchester Gazette* in 1730, and the *Oxford Journal* in 1740. In 1843, 212 newspapers were published in provincial towns of England, and 8 in Wales. The provincial newspapers of England numbered in 1877 about 980, besides 56 belonging to Wales, and 20 to the islands. About a fifth of the number profess conservative or liberal-conservative principles, a half liberal, a small number perfect independence in politics, and the rest are avowedly neutral. Only a very few of these are conducted with anything like ability. Among the more important are the *Manchester Examiner*, which is understood to have a circulation of 35,000, and the *Newcastle Chronicle* of 36,000, and the *Manchester Guardian*. A characteristic feature of many second-class provincial papers is a column of gossip or scandal, entitled a letter "from our London correspondent."

The newspaper press of Scotland began during the civil wars of the 17th century. A party of Cromwell's troops, who arrived at Leith in 1652 to garrison the citadel, brought with them a printer named Christopher Higgins, to reprint the London paper, *Mercurius Politicus*. The first number was issued on Oct. 26, 1653, and in Nov., 1654, the establishment was transferred to Edinburgh, where the reprinting went on till 1660. On Dec. 31, 1660, the first number was published of the *Mercurius Caledonius*, which professed to furnish information regarding the "affairs in agitation in Scotland, with a survey of foreign intelligence." It lived only three months, and was succeeded by *The Kingdom's Intelligencer*. The *Edinburgh Gazette*, an official paper published by authority, was established in 1669 by James Watson, a printer of eminence and skill. In 1702 Watson also started the *Edinburgh Courant*, which attained its 215th number, and in 1706 the *Scots Courant*. In 1718 the town-council of Edinburgh gave a privilege to James M'Laren to print the *Edinburgh Evening Courant* three times a week, on condition that before publication he should give "ane coppie of his print to the magistrates." This paper still exists as the *Edinburgh Courant*, now a daily paper, and the principal conservative journal in Scotland. The *Caledonian Mercury*, now defunct, was first published April 28, 1720. The *Scotsman*, which came into existence in 1817, under the conduct of Mr. Charles Maclaren, and was for a short time edited by Mr. J. R. M'Culloch, the political economist, is the most influential liberal journal in Scotland, and is believed to have a circulation of 55,000, larger than that of any daily paper out of London. The earliest Scottish provincial newspaper was the *Glasgow Courant*, established in 1715. The *Aberdeen Journal* was founded in 1746 by Mr. James Chalmers; the first number contained an account of the battle of Culloden. The number of newspapers published in Scotland in 1843 was 69: it is now 180, a good proportion belonging to Edinburgh. A few of the leading newspapers of Scotland contain articles little inferior in talent to those of the best English newspapers, and exercise considerable political influence, at least in matters relating to Scotland. About a score of the Scottish papers are regarded as conservative, 60–70 liberal, and the rest independent or neutral in politics. Edinburgh has in all 12 newspapers, including the weekly issues of the 4 dailies; Glasgow 19 (with 6 dailies); Aberdeen 5 in all; Dundee 5; Paisley 5. The price of most of the daily papers is 1d.; of some it is ½d.; that of the weeklies and bi-weeklies varies from ½d. to 4d.

In Ireland, a news-sheet, called *Warranted Tidings from Ireland*, was printed during the rebellion of 1641; but the first Irish newspaper, properly so called, was the *Dublin Newsletter*, commenced in 1685. *Pue's Occurrences*, a Dublin daily paper, originated in 1700, was continued for half a century. It was followed, in 1728, by another daily paper, *Faulkner's Journal*, established by George Faulkner, "a man celebrated for the goodness of his heart, and the weakness of his head." The oldest existing Dublin newspapers are *Saunders'* (originally *Esdaile's*) *Newsletter*, begun in 1746, and the *Evening Post*, instituted in 1725. The *Limerick Chronicle*, the oldest Irish provincial paper, dates from 1766. Ireland possessed 79 newspapers in 1843, and had in 1880 about 140. Most of them are characterized by an energy of language, and a strength of political bias, unknown in the other parts of the United Kingdom. The *Irish Times* and the *Evening Mail*, published in Dublin, and the *Belfast News Letter*, are influential daily papers.

The Isle of Man supports 1 conservative, 2 liberal, and 1 neutral journal. Jersey has 9 journals, 4 printed in French and 5 in English; 4 are liberal, 1 conservative, 2 liberal-conservative, 1 independent, and 1 neutral. Guernsey has an official gazette printed in French, which is Protestant and neutral, besides 2 liberal, 1 liberal-conservative, and 2 neutral papers. These local papers are conducted with a great amount of spirit and success.

In the British colonies, newspapers are numerous, including those in India, printed in

the Bengalee and other native languages. *Hicking's Gazette*, the first Anglo-Indian newspaper, appeared in Calcutta in 1781; it was followed, in 1784, by a small official sheet, the *Calcutta Gazette or Oriental Advertiser*. The still surviving *Bengal Hurkuru* was established in 1795. In the earlier times of Indian newspapers, though there was no direct censorship, exemplary punishment was often inflicted on the authors of offensive paragraphs. In 1794 Mr. Ducane, editor of the *World*, was transported to Europe for an inflammatory address to the army which appeared in his paper; and a similar result followed, in 1798, to another editor, who made some severe observations on the official conduct of a local magistrate. A censorship, established by lord Wellesley, in 1799, was abolished by the marquis of Hastings in 1818; but a license, revocable at pleasure, was required to be taken out by every printer of a newspaper. In 1832 the Indian press consisted of 6 European and 5 native journals. The licensing system was done away with by lord Metcalfe's law of 1835, a step disapproved of by the East India directors, but was again reverted to on the occurrence of the mutiny in 1857. In 1878 an Indian press law tantamount to a censorship was enacted, applicable to the vernaeular press only. In 1875 there were in India 135 Eng., 270 vernacular, and 55 mixed newspapers.—The first Australian paper was the *Sydney Gazette*, founded in 1803. Hobart Town had its journal in 1804, and in 1824 newspapers began to multiply in the Australian colonies. The principal are now the *Sydney Herald*, the *Sydney Mail*, the *Argus* of Melbourne, and the *South Australian Register*. The materials for printing this last-named paper were carried out by the original South Australian colonists, the first number having been previously printed in England. A similar course was adopted by the first New Zealand colony in 1839 in founding their *New Zealand Gazette* and *New Zealand Advertiser*. Tahiti has, since 1844, had its *L'Océanie Française*. There is also the *Fiji Times*, the *Fiji Gazette*, and the *Central Polynesian*.

France.—The earliest French newspaper is said to have been established by Théophraste Renaudot, a physician, in the beginning of the 17th century. The first number of his *Gazette* appeared in 1631. In the following year, through interest of cardinal Richelieu, he obtained a royal privilege for his *Gazette;* it was continued weekly up to 1762, and then began to appear twice in the week, and to combine advertisements with public news. Commercial intelligenee was added in 1765, and in 1792, theatrical announcements. In 1650 was started the *Gazette Burlesque*, a journal in verse, edited by the poet Jean Loret, devoted in a great measure to the *chronique scandaleuse* of Paris; and in 1672, the *Mercure Galant*, a politieal and literary journal, which afterwards became the *Mercure de France*, and was continued during the revolution, and down to 1815. The first French daily newspaper was the *Journal de Paris*, which began in 1777, and was discontinued in 1819. A large crop of journals sprang into being with the revolution, organs respectively of republicans, Jaeobins, and royalists, but most of them had a very brief existence. Under the first Napoleon the freedom of the press was much restricted. By one of his earliest ordinances as first consul, all the newspapers were suppressed except 13, and under the empire the tolerated journals were allowed to be little more than echoes of the official *Moniteur*. From the danger which attended the handling of political questions, arose the practice of filling a large portion of the sheet with the *Feuilleton* consisting of a sketch or tale by a popular writer, which has ever since been a charaeteristic of French journalism. During the restoration period, the press being again less fettered, there was a large increase in the number of newspapers. In 1826 there were 127, and in 1829, 307 newspapers published in Paris. The July revolution at first added still further to their number; but the restrictive measures of 1834, consisting in the imposition of a stamp duty, and of an obligation to find security to the amount of 24,000 francs, led to the collapse of a large proportion of the then existing journals. The *Moniteur*, *Débats*, and *Presse* were in possession of the government, and for a time also the *Constitutionnel*, and every shade of politieal opinion had its recognized organ. Emile de Girardin's seheme of widening the circulation of the government organ, the *Presse*, by bringing down the subscription price from 80 to 40 francs, had the result of reducing the priee of the opposition journals also. Cheap newspapers being thus established, it soon appeared that with the class among whom they circulated most widely the *feuilleton* was regarded of more importance than the political article, and it thus became the policy of the journalists to pay enormous sums to the cleverest novelists of the day, in order to retain them in their service; 100,000 francs paid by Dr. Véron of the *Constitutionnel* to Eugène Sue for his *Juif Errant*, turned out as profitable a speculation for the journalist as for the novelist.

The revolution of 1848, like the revolutions that had gone before it, gave birth to a multitude of short-lived journals. There were 89 different political journals started into ephemeral existence in Paris during the late commune, from Mar. 19 to May 27, 1871. When the late emperor Napoleon was president of the republic, a law was passed obliging the author of every newspaper article to affix his name to it. In Feb., 1852, the press laws were incorporated, with increased stringency, into a *Décret organique sur la Presse*. Louis Napoleon, during the empire, relaxed the stringency a little. The republic holds newspapers in as great bondage as did its imperial predecessor. Among the most important daily papers published in Paris are the *République Français*, *Pays*. *Siècle*, *Presse*, *Débats*, *Bien Public*, *France*, *Journal Officiel*, *Charivari*, *Temps*, and *Figaro*.

Belgium.—In the Low Countries an illustrated war gazette, called the *Niewetijdinghe*,

was first published in 1605; it was the precursor of the *Gazette van Antwerpen*, which survived till 1805. During the Spanish and Austrian rule, each town had its privileged newspaper, but the press was considerably fettered in the expression of political opinion. Under the French rule, most of these journals disappeared or sunk into insignificance. The *Annales Politiques* was a political journal of considerable popularity during last century. Since the revolution of 1830, the press has been subject to few restraints, the newspapers have been numerous, and some few of them well conducted. The *Indépendance Belge* has a large circulation, and exercises considerable political influence. It is the property of a company of bankers, and is conducted by a Frenchman of talent and liberal sentiments. The *Moniteur Belge* was instituted as the official organ of the ministry in 1830. *Le Nord*, a Russian organ published in Brussels, is conducted with great ability. A large circulation is enjoyed by the *Journal de Bruxelles*, the *Emancipation*, and the *Etoile Belge*—all papers in the interest of the *parti prêtre*. and supplied with correspondence from Rome. The *Echo de Bruxelles* and the *Journal de Belgique* are independent papers. The *Précurseur d'Anvers*, and the *Escaut* of Antwerp, have a good circulation—the latter is at once ultramontane and ultra-democratic.

Holland.—The earlier newspapers of Holland were in some respects, particularly in the accuracy of their information, in advance of those of other countries, but gave far more prominence to commercial than to political intelligence. They all bore the name of *Courant* appended to the name of the town where they were published. Though subject to no censorship since 1815, it was not till 1830 that they began to comment on political occurrences. At present the principal Dutch journals are the *Allgemeene Handelsblad* of Amsterdam, and *Amsterdam Courant;* the *Harlemsche Courant;* and the *Journal de la Haye, De Nederlandsche Stoompost*, and *Staats Courant*—published at the Hague.

Switzerland.—Switzerland being a confederation of states, each with its own institutions, the Swiss newspapers have a very local character; but they are numerous, and some of them have of late years greatly improved in character. The *Swiss Times*, published in Geneva, and printed in both French and English, is now frequently quoted in all countries.

Germany.—Though in Germany the *Relationen*, above alluded to, were in some sort the precursors of newspapers, yet no serial newspaper, properly so called, seems to have existed till 1615. Frankfort was the first town that possessed its journal; next followed Fulda, Hildesheim, and Herford. The earliest Leipsic newspaper was instituted in 1660. The first newspaper with a staff of foreign correspondents was the *Hamburgsche Correspondent;*. but no German newspaper can be said to have had any political weight till the institution of the *Allgemeine Zeitung*, founded by Cotta in 1798, now published at Munich, which still takes rank as the first paper in Germany. During French ascendency, the German papers were little more than echoes of the Parisian; but a number of journals of a more national character sprung up during the war of liberation. The abuse of the liberty of the press after 1830 led to the imposition by the diet of restrictions of a somewhat severe character on newspapers. Although within the last 20 years there has been a decided improvement in the literary and political character of the German newspapers, the socialist law of 1878 is a severe restriction of the liberty of the press. Among the principal Berlin daily papers are the *Vossische Zeitung*, the *Norddeutsche Allgemeine Zeitung* (semi-official), the *Neue Preussische Zeitung* (usually known as the *Kreuz Zeitung*), *Post*, *National-Zeitung*, and *Volks-Zeitung*. The *Allgemeine Zeitung*, published at Augsburg, is a very influential and well-conducted journal.

Austria.—The Austrian newspapers have partaken of the advance in the newspaper press of Germany. The most important of them is the *Wiener Zeitung*, with its evening reprint, the *Wiener Abendpost*, not insignificant either in a literary or political point of view, and the *Neue Freie Presse*.

Italy.—We have mentioned the early *Notizie Scritte* or gazettes of Venice. The news-sheets which followed them were in disfavor with the see of Rome: and a memorable bull denouncing them was issued by Gregory XIII. Up to 1847 the newspapers of Italy were small, politically insignificant, and subject to a strict censorship. With the accession of pope Pius IX., a flood of political journals made their appearance, one or two of which only were conducted with any approach to talent, and few lasted above a year. In the Sardinian dominions there continued to be no fewer than 45 political papers published in 1852, 41 of which were printed in Italian and 4 in French. Of that number a great many soon afterwards collapsed. The removal of the former restrictions of the press in other parts of the kingdom of Italy has started into life a number of newspapers; 17 political and 10 partially political papers are now published in the dominions of Victor Emmanuel, besides 31 periodicals, many of which answer more or less to our ideas of a newspaper. Few of these newspapers are as yet of much promise. The leaders are poor, no great social or commercial questions are discussed, and each journal is the mere advocate of one or other of the political parties. Perhaps the best of them on the whole are *Il Diritto* and *L'Opinione*, which may be compared to some of the second-rate French papers. The *Gazetta Ufficiale del Regno d'Italia* is the ministerial organ, and *L'Italie*, published in France, is looked upon as the organ of the department of foreign affairs. Humorous newspapers, after the model of our *Punch*, are abundant. The *Voce della Verita* is the paper which advocates the cause of the pope. *La Liberta*

and *Il Fanfulla* are published in Rome; Genoa issues its *Carrière Mercantile;* Milan, *La Perseveranza;* and Naples, the *Pungolo* and *Patria.*

Spain.—Sheets called *Relaciones,* giving accounts of important occurrences, used to appear in Spain at irregular intervals in the 17th c., occasionally in the form of romances; but no Spanish newspaper, properly so called, existed till last century, and 50 years ago Madrid possessed but one journal. The first approach to political journalism followed in the wake of the peninsular war and the establishment of the cortes. The gross license with which many of the then established papers were conducted, led, in 1824, to the suppression of all except the *Diario* and *Gaçeta* of Madrid, the *Gaçeta de Bayona,* and a few which were purely commercial or scientific. At present, about 40 journals are published in Madrid, politically and in every other respect very unimportant; the most read is the *España.* The press of Portugal is as insignificant as that of Spain: the official organ is the *Diario do Governo.*

Sweden and Norway.—The earliest Swedish newspaper seems to have been the *Ordinarie Post Tidende,* established in 1643, and continued till 1680. It was followed by the *Relationes Curiosæ* in Latin (1682–1701). Two French papers, the *Gazette Française de Stockholm* and the *Mercure de Suède,* existed in Sweden in the second half of last century, but politically the newspaper press cannot be said to have had any influence until the establishment of the *Argus* by Johanssen in 1820. For a number of years the principal journals of Sweden were the *Fäderneslandet,* the organ of the royalists, and the *Aftonbladet,* that of the reformers. The latter, on king Oscar's accession, ceased to be an opposition journal. The official paper is the *Post och Inrikes Tidningar.* Every provincial town has now its journal, and there are about 114 newspapers in all published in Sweden. Of the Norwegian papers the oldest is the *Christiania Intelligentssedler,* founded in 1763. *Den Constitutionelle* is the government journal, and *Den Morgenblad* the organ of the opposition.

Denmark.—In Denmark journalism is still more recent. Up to 1830 only two newspapers were published in Copenhagen, both entirely made up of extracts from foreign journals. Since 1834 there has been an improvement in the character and increase in the number of the Danish journals. They numbered 36 in 1849. The oldest newspaper now existing in Denmark is the semi-ministerial *Berlingske Tidende,* founded in 1749. The *Fädrelandet* is the journal of the Scandinavian popular party.

Russia.—The earliest newspapers in Russia were published under the personal surveillance of Peter the great, first in Moscow and afterward in Petersburg, to report the progress of the war with Sweden. Political journalism, properly so called, has, however, never flourished in Russia, and has, in fact, only been allowed in important political crises—as the French invasion of 1812, the Polish insurrection of 1830, and recently during the Crimean war, when the journalists were allowed to exercise their ingenuity in defending the government policy. The largest circulation was at that time attained by the *Sjéwernaja Ptsch'eta,* or *Northern Bee,* which had its feuilleton. Generally speaking, the Russian newspapers occupied themselves with scientific and literary subjects rather than public or political news. The *Journal de St. Petersbourg,* in French, is the organ of the court, and has considerable circulation out of Russia.

Turkey.—The first newspaper in Turkey was founded in 1795 by M. Verminhac, envoy-extraordinary of the French government to the court of Selim III., and printed in French at Pera. A Frenchman of the name of Blacque established at Smyrna, in 1825, the *Spectateur de L'Orient,* afterwards the *Courrier de Smyrne,* which had considerable political influence during the Greek war. The same M. Blacque afterwards edited the official journal of the porte, called the *Moniteur Ottoman,* which has, since 1832, been reprinted in Turkish under the name of the *Taquîmi Vaqâi.* The *Taquîmi* was till lately a very badly printed sheet, but it has much improved, and now issues weekly instead of monthly, sometimes containing very fair literary and political articles. But the most important Turkish paper is the *Djeridei Havadis,* founded in 1843 by Mr. Alfred Churchill, an Englishman born in Turkey. It embraces a great variety of matter, a court gazette, official appointments, home and foreign news, advertisements, prices of stocks, and a feuilleton. There are besides in Constantinople two new and popular papers, called the *Terguman Ahwal,* or *Interpreter of Events,* published three times a week, and the *Tas Veeri Evkiar,* or *Mirror of Thoughts,* published twice a week. The latter has a scientific and literary repute. The Turkish papers have no leading articles, and from the constitution of political society in Turkey, there can be no avowed opposition to the policy of the government. The *Courrier de Constantinople,* in French, is one of the principal journals of the capital; here appear also the *Levant Herald* and the *Levant Times* in English. And papers in French, Italian, Greek, and Armenian are published in various parts of the empire.

Greece.—Various newspapers in modern Greek appeared at Paris and Vienna before Greece obtained her independence; but the first political published in Greece was the *Hellēnikē Salpigx,* founded in 1824, and soon followed by the *Hellēnika Chronika* and *Hellēnikos Tēlegraphos* in Missolonghi, the *Philos tou Nomou* at Hydra, the *Ephēmerides Athenaikai* at Athens, and the official *Genikē Ephēmeristēs Hellados* published at Nauplia, with its opponent the *Apollōn,* which afterwards became the *Athēna.* Most of these papers disappeared in 1833 on the system of sureties being introduced. The *Sōtēr* was established as the government organ in 1833. Upwards of eighty newspapers are now

published in Greece, the largest number of them in Athens. Of these several appear in in French, Italian, and English. The leading political journal of Athens is the semi-monthly *Spectateur d'Orient;* but generally speaking, the Greek papers make no endeavor to lead the parties in the state.

United States.—In America the earliest newspaper was the *Boston Newsletter*, founded in 1704, insignificant in size and contents, and conducted by John Campbell, the postmaster of the town. A rival to it appeared in 1719 in the *Boston Gazette*, "published by authority." The *Boston Newsletter*, however, throve in spite of opposition. With the name changed to the *Massachusetts Gazette and Boston Newsletter*, it was the support of the British rule against the desire for independence, and ceased to appear when the British troops evacuated Boston. The *New England Courant*, established in 1721, was at first printed by James Franklin, and afterwards edited by his brother the famous statesman. It lasted but six years, but a subsequent newspaper, entitled the *Pennsylvania Gazette*, was started by Benjamin Franklin in 1729, and continued weekly till 1745, when it merged in the *North American. Ede's Boston Gazette*, begun in 1755, was for a long time the chief organ of the popular party; in it appeared John Adams's "Letters of Novanglus." The *Massachusetts Spy* was another paper of note on the revolutionary side. It was afterwards removed from Boston to Worcester, and still appears as the *Worcester Spy*. At the revolution the New England colonies possessed 14 newspapers; Pennsylvania, 9; New York, 4; and the middle and southern colonies, 10. All save the semi-weekly *Advertiser* of Philadelphia were published weekly. The development of the newspaper trade has kept pace with the advancing prosperity of the country. In 1800 the number of newspapers had increased to 200, of which several were daily papers. In 1810 there were 359, including 27 daily sheets. In 1828 852 papers appeared; in 1850 no less than 2,526; while in 1870 there were 5,871 newspapers, with a circulation of 20,842,475, and a yearly issue of 1,508,250. In 1880 the number of weekly papers had reached 8,633, besides 133 semi-weekly and 971 daily papers. Some of the New York weeklies have an enormous circulation, the *Ledger* having occasionally sent out upwards of 400,000 copies. The Germans publish 641 papers in their own tongue; the Scandinavians, 49; Spaniards, 26; Italians, 4; Welsh, 5; Bohemians, 13; Poles, 2; Portuguese, 2; while there is a Chinese newspaper published at San Francisco, and a Cherokee one at Tahlequah in the Indian territory. About 11,500 periodicals, with an aggregate circulation of 31,200,000 were issued in the U. S., in 1880. Among the leading newspapers of New York, (daily) are the *New York Tribune*, the *World*, the *Herald*, the *Times*, the *Sun*, the *Evening Post*, the *Commercial Advertiser*, and the *Mail and Express*.

The principal religious papers published in New York are the *Observer* and *Evangelist*, organs of the Presbyterians; *Independent* and *Christian Union*, bound to no denomination; the *Churchman* is Episcopal; the *Christian Advocate*, Methodist; and the *Examiner*, Baptist. The Unitarians are represented by the *Liberal Christian;* the Catholics by the *Tablet;* and the Swedenborgians and Jews have also their papers.

All the other numerous journals of the American states are, compared with those of New York, accounted provincial, but many are, nevertheless, vigorously conducted. Each county, comprising, on an average, 360 sq.m., has generally two or three papers—one being republican, another democratic, and if there is a third, it is probably the organ of some religious or other sect. The printer is, in most cases, the editor, and the village lawyer supplies leaders seasoned frequently with personal attacks. Some of them have been successfully started with no larger a capital than $100 of borrowed money.

There is an immense collection of newspapers in the British museum, which belonged in part to the library of sir Hans Sloane, in part to that of Dr. Charles Burney. See Andrew's *History of British Journalism* (London, 1859). Grant's *The Newspaper Press; its Origin, Progress, and Present Condition* (London, 1871).

NEWSPAPER (*ante*). See AMERICAN JOURNALISM.

NEWSTEAD ABBEY, the home of the Byrons, about 8½ m. n.w. of Nottingham, England. It was founded by Henry II. in 1170, as a priory of black canons. When Henry VIII. dissolved the monasteries it was granted to sir John Byron, who made over a part of it into a dwelling, and it has since been subjected to so many alterations and additions that, though originally a fine specimen of the early Anglo-Gothic, it is now a composite of many styles. The fifth lord Byron, the poet's great-uncle, tore down much of the house, felled large tracts of timber, and did what he could to ruin the estate, from hatred for his son the heir, who, after all, did not survive his father. Lord Byron sold the estate in 1817 to col. Wildman for £180,000. Wildman spent over £200,000 in improving it, and preserved all the memorials of the poet, his former schoolfellow, which he found. Newstead abbey was in 1881 the property of William Frederick Webb.

NEW STYLE. See CALENDAR, DATE.

NEW SWINDON. See SWINDON.

NEWT, or EFT, *Triton*, a genus of batrachians of the family *salamandridæ*, more aquatic in their habits than the salamander, to which, in form and characters, they are very similar, having an elongated body and tail, and four small weak limbs. The tail is vertically compressed, and a crest is often developed on the back and tail, but the crest

is characteristic of the males in the breeding season, and the tail becomes rounded when the animals leave the water, as they often do, particularly in the latter part of summer, or in autumn; which, along with other variations apparently dependent on circumstances, have caused no little multiplication of specific names. The most abundant British species is the COMMON NEWT, or SMOOTH NEWT (*T. punctatus*, *Lissotriton punctatus*, or *Lophinus punctatus*), which is from 3½ to 4 in. long, brownish gray above, yellowish beneath, spotted with black, with a soft, smooth skin, and two bands of pores on the head; a well-known inhabitant of stagnant pools and ditches, often found also under stones, and in other damp situations. The WARTY NEWT (*T. palustris*, or *cristatus*), also pretty common, is 5 or 6 in. in length, blackish brown above with round spots of a darker tint, bright orange or orange-yellow with black spots on the under parts, the sides dotted with white, and the tail often exhibiting a white band, the skin rough or warty, and with many pores. The dorsal and caudal crests of the warty newt are separate; those of the common newt are united. Many other species occur in other parts of the world. They all feed on animal food, of which tadpoles and aquatic insects form the chief portions. They deposit their eggs on the leaves of aquatic plants, each egg separately, twisting or folding the leaf with their feet so as to conceal the egg, which is surrounded by a viscous substance, so that the leaf is retained in this form. The transformation of newts are noticed, and illustrations given, in the article BATRACHIA. They very frequently change their skin. They possess, in an extraordinary degree, the power of reproducing lost members—a limb, a tail, even an eye—in every respect perfect. Spallanzani, who made many observations on this subject, found that the same member could be reproduced a number of times successively. Newts are also capable of surviving, although long frozen up in ice, and return to activity when a thaw takes place. A strong and almost universal popular prejudice exists against them as most noxious animals, although they are not in the slightest degree venomous. They have recently, however, begun to be more favorably regarded in consequence of the frequency of aquaria, of which they are interesting inmates.—It is a curious fact that Linnæus, contrary to his usual discriminating penetration, confounded newts with lizards, which they resemble merely in form, differing widely in the most important characters. That they are often confounded by the unscientific is not wonderful.

NEW TESTAMENT. See BIBLE, *ante*.

NEWTON, a co. in n.w. Arkansas, drained by the Buffalo fork of White river, and other branches; 800 sq.m.; pop. '80, 6,127—6,124 of American birth, 5 colored. The surface is undulating, hilly in some portions, and heavily wooded. The soil is mostly fertile, and the principal productions are Indian corn, wheat, and tobacco. Large quantities of butter, honey, and sorghum molasses are made. There are deposits of lead in some portions. Co. seat, Jasper.

NEWTON, a co. in n. central Georgia, bounded on the s.w. by the South river, drained by the Yellow and Ulcofauhatchee rivers, which unite with the South, in the s. portion of the co., to form the Ocmulgee; situated on the Georgia railroad; 300 sq.m.; pop. '80, 13,619—13 of foreign birth. The surface is diversified, and large portions of it heavily wooded with hickory and oak. The soil is fertile, especially near the rivers, and produces good crops of corn, wheat, oats, cotton, and sweet potatoes. Considerable quantities of butter, molasses, honey, and wool are raised. There are a number of tanneries, saw-mills, and manufactories of cotton yarn. Co. seat, Covington.

NEWTON, a co. in n.w. Indiana, adjoining Illinois; bounded on the n. by the Kankakee river, traversed in the s. by Iroquois river, and on the line of the Pittsburg, Cincinnati, and St. Louis railroad. The surface is level, mostly prairie, with swamps in some portions. Beaver lake is situated in the north. The soil is fertile, and produces good crops of Indian corn, wheat, oats, potatoes, and hay. Other staples are cattle and wool. Co. seat, Kentland. Pop. '80, 8,167.

NEWTON, a co. in e. central Mississippi, drained by the Young Warrior, and the branches of the Chickasawha river; on the Vicksburg and Meridian railroad; 560 sq.m.: pop. '80, 13,436—48 of foreign birth, 5,009 colored. The surface is undulating, and heavily wooded. The soil is fertile, and produces good crops of corn, wheat, oats, sweet potatoes, and cotton. Other staples are wool, pork, butter, and molasses. Large numbers of cattle are raised. Co. seat, Decatur.

NEWTON, a co. in s.w. Missouri, bordering on the Indian territory and Kansas, drained by the branches of Grand river and Elk river, and by Waterfall creek, and crossed by the St. Louis and Pacific railroad; 650 sq.m.; pop. '80, 18,948—603 colored. The surface is heavily wooded with hickory, red and white oak, black walnut, and ash. The soil is mostly fertile, and the principal productions are Indian corn, wheat, oats, sweet potatoes, and tobacco. Other staples are cattle, butter, wool, and sorghum molasses. Carboniferous limestone and lead are found. There are flouring and saw-mills, and pig-lead is manufactured. Co. seat, Neosho.

NEWTON, a co. in s.e. Texas, bounded on the e. by the Sabine river, which separates it from Louisiana, and drained by the branches of the Sabine; 850 sq.m.; pop. '80, 4,359—1507 colored. The surface is broken by hills in the n., is more undulating in the s., and heavily wooded with good timber trees. The soil in the hilly portion is sandy

and unproductive, but fertile in the lower lands around the rivers. The principal productions are corn, sweet potatoes, and cotton. There are large numbers of cattle; considerable molasses is made. Co. seat, Newton.

NEW'TON, a township in Massachusetts, on Charles river, 8 m. w. of Boston. It contains 2 villages, Upper Falls and Lower Falls, with 3 paper-mills, 3 cotton and hosiery factories, a Baptist theological seminary, and 12 churches. Pop. '70, 12,852.

NEWTON (*ante*), in Middlesex co., Mass., bounded on the n., s., and w. by the Charles river; on the Boston and Albany, and the New York and New England railroads; pop. '80, 16,995. It contains, besides the villages mentioned, *ante*, several others, as Newtonville, Newton Center, West Newton, and Auburndale. It is a favorite place of residence for persons doing business in Boston. Its public schools are among the best in the state. A number of private schools, and the Newton theological seminary, founded by the Baptists in 1826, are situated here. There are 27 churches, 2 newspapers, 2 banks, a public library, and a number of private libraries. There are cotton, silk, and paper mills, machine and cordage manufactories, etc. Newton anciently belonged to Cambridge, was incorporated as a town in 1679, and as a city in 1873.

NEWTON, Charles Thomas, b. England, 1816; educated at Oxford. In 1840 he became assistant keeper of the department of antiquities in the British museum, but resigned in 1852, and obtained the appointment of vice-consul at Mytilene, where he went for the purpose of securing some of the antique sculptures known to exist in Asia Minor, and in the Ægean islands. He passed a number of years in the exploration of the archipelago, discovering at Halicarnassus (the modern Budrum) the site of Artemisia's mausoleum. He carried on excavations at Branchidæ and Cnidus, 1856–59. He unearthed many valuable sculptures, which, with a fine collection of ancient vases, coins, and inscriptions, he presented to the British museum. In 1860 he was appointed consul at Rome, in 1861 keeper of Greek and Roman antiquities in the British museum, and in 1880 prof. of archæology at University coll., London. His wife, a well-known artist, d. in 1866.

NEWTON, Gilbert Stuart, 1794–1835; b. N. S.; came to England in 1817, and, after a tour in Italy, became a student at the royal academy, where he made the acquaintance of Washington Irving and Charles R. Leslie. His first works to attract attention were "The Forsaken" and "The Lover's Quarrel," engraved in the *Literary Souvenir* for 1826; both were in the manner of Watteau. In 1830 he painted "Shylock and Jessica;" "Yorick and the Grisette," from the *Sentimental Journey;* and "Abbot Boniface" from the *Monastery.* In 1831 he exhibited "Portia and Bassanio," and "Lear attended by Cordelia." In 1832 he returned to this country, where he married. On his return to England the next year, he was elected to the royal academy, and exhibited a small picture of "Abelard." He also painted "The Vicar of Wakefield," "Macheath," and a few portraits. He was insane for the last two years of his life.

NEWTON, Sir Isaac, the most remarkable mathematician and natural philosopher of his own or perhaps of any other age, was b. at Woolsthorpe, in Lincolnshire, in the year 1642. That year, remarkable in English history for the breaking out of the civil war between Charles I. and the parliament, is doubly remarkable in the history of science by the birth of Newton and the death of Galileo. The circumstances with which the pursuit of truth, in scientific matters, was at this time surrounded in the respective countries of these great philosophers, were not more different than the characters of the philosophers themselves. Galileo died a prisoner, under the surveillance of the inquisition, "for thinking, in astronomy," as Milton says, "otherwise than the Franciscan and Dominican licensers thought." In England, it had become the practice, and soon became the fashion, through the influence of Bacon and Descartes, to discard altogether the dictates of *authority* in matters of science. The dispositions of the two philosophers were happily suited to the situations in which they thus found themselves. Galileo's was a mind whose strength and determination grew by the opposition it encountered. The disposition of Newton on the other hand, diffident of the value and interest of his own labors, and shrinking from the encounter of even scientific controversy, might have allowed his most remarkable discoveries to remain in obscurity had it not been for the constant and urgent solicitation of his friends that they should be published to the world.

Newton received his early education at the grammar school of Grantham, in the neighborhood of his home, at Woolsthorpe. On June 5, 1661, he left home for Cambridge, where he was admitted as subsizar at Trinity college. On July 8 following, he matriculated as sizar of the same college. He immediately applied himself to the mathematical studies of the place, and within a very few years must have not only made himself master of most of the works of any value on such subjects then existing, but had also begun to make some progress in the methods for extending the science. In the year 1665 he committed to writing his first discovery on fluxions; and it is said that in the same year, the fall of an apple, as he sat in his garden at Woolsthorpe, suggested the most magnificent of his subsequent discoveries—the law of universal gravitation. On his first attempt, however, by means of the law so suggested to his mind, to explain the lunar and planetary motions, he employed an estimate then in use of the radius of the earth, which was so erroneous as to produce a discrepancy between the real force of

gravity and that required by theory to explain the motions, corresponding to the respective figures 16.1 and 13.9. He accordingly abandoned the hypothesis for other studies. These other pursuits to which he thus betook himself, consisted chiefly of investigations into the nature of light, and the construction of telescopes. By a variety of ingenious and interesting experiments upon sunlight refracted through a prism in a darkened apartment, he was led to the conclusion that rays of light which differ in color, differ also in refrangibility. This discovery enabled him to explain an imperfection of the telescope, which had not till then been accounted for. The indistinctness of the image formed by the object-glass was not necessarily due to any imperfection of its form, but to the fact of the different colored rays of light being brought to a focus at different distances. He concluded rightly that it was impossible for an object-glass consisting of a single lens to produce a distinct image. He went further, and too hastily concluding, from a single experiment, that the dispersive power of different substances was proportional to their refractive power, he pronounced it impossible to produce a perfect image by a combination of lenses. This conclusion—since proved erroneous by the discovery of the acromatic telescope by Mr. Chester More Hall, of More Hall, in Essex, about 1729, and afterwards, independently, by Mr. Dollond in 1751—turned Newton's attention to the construction of reflecting telescopes; and the form devised by him is the one which, at later periods, reached such perfection in the hands of sir William Herschel and lord Rosse.

It was on Jan. 11, 1671, that Newton was elected a member of the royal society, having become known to that body from his reflecting telescopes. At what period he resumed his calculations about gravitation, employing the more correct measure of the earth obtained by Picard in 1670, does not clearly appear; but it was in the year 1684 that it became known to Halley that he was in possession of the whole theory and its demonstration. It was on the urgent solicitation of Halley that he was induced to commit to a systematic treatise these principles and their demonstrations. The principal results of his discoveries were set down in a treatise called *De Motu Corporum*, and were afterwards more completely unfolded in the great work entitled *Philosophiæ Naturalis Principia Mathematica*, which was finally published about midsummer, 1687.

Shortly before the *Principia* was given to the public, Newton had been called to take an active part in defending the rights of the university against the illegal encroachments of James II. The conspicuous part which he had taken on that occasion procured him a seat in the convention parliament, in which he sat from Jan., 1689, to its dissolution in 1690. In 1696 he was appointed warden of the mint, and was afterwards promoted to the office of master of the mint in 1699, an office which he held till the end of his life. He again took a seat in parliament, in the year 1701, as the representative of his university. Thus engaged in the public service, he had little time left for mere scientific studies—pursuits which he always held of secondary importance to the public duties in which he was engaged. In the interval of public duty, however, Newton showed that he still retained the scientific power by which his great discoveries had been made. This was shown in his solution of two celebrated problems proposed in June, 1696, by John Bernouilli, as a challenge to the mathematicians of Europe. A similar mathematical feat is recorded of him so late as 1716 in solving a problem proposed by Leibnitz, for the purpose, as he expressed it, of feeling the pulse of the English analysts. When in parliament, Newton recommended the public encouragement of the invention of a method for determining the longitude—the first reward in consequence being gained by John Harrison for his chronometer. He was president of the royal society from 1703 till his death, a period of twenty-five years, being each year re-elected. In this position, and enjoying the confidence of prince George of Denmark, he had much in his power towards the advancement of science; and one of his most important works during this time was the superintendence of the publication of Flamsteed's *Greenwich Observations*—a task, however, not accomplished without much controversy and some bitterness between himself and that astronomer. The controversy between Newton and Leibnitz, as to priority of discovery of the differential calculus, or the method of fluxions, was raised rather through the partisanship of jealous friends than through the anxiety of the philosophers themselves, who were, however, induced to enter into and carry on the dispute with some degree of bitterness and mutual recrimination. The verdict of the impartial historian of science must be that the methods were invented quite independently, and that, although Newton was the first inventor, a greater debt is owing by later analysts to Leibnitz, on account of the superior facility and completeness of his method. The details of these controversies, with all other information of the life of this philosopher, will be found admirably collected in the life by sir D. Brewster, who writes with not only an intimate acquaintance with Newton's works, but in the possession of all the materials collected in the hands of his family. Newton died on Mar. 20, 1727, and his remains received a resting-place in Westminster abbey, where a monument was erected to his memory in 1731. A magnificent full-length statue of the philosopher, executed by Roubilliac, was erected in 1755 in the antechapel of Trinity college, Cambridge. This work was assisted by a cast of the face taken after death, which is preserved in the university library at Cambridge. In 1699 Newton had been elected a foreign associate of the academy of sciences, and in 1703 he received the honor of knighthood from queen Anne. Among the best editions of Newton's principal works

are the quarto edition of the *Optics* (Lond. 1704), and the quarto edition of the *Principia*, published at Cambridge in 1713.

NEWTON, Isaac, 1794–1858: b. New York; son of a revolutionary soldier; became a great ship-builder, superintended the construction of more than 90 vessels, and was a naval architect of distinguished reputation. He was the builder of the *Hendrick Hudson* a river steamboat named in honor of the discoverer, and at the time (1851) considered very elegant; also the *New World*, built about the same time, for the navigation of the North river.

NEWTON, John, 1725–1807; b. London; son of a sea-captain; devoted by his mother to the Christian ministry. But her death occurring when he was seven years of age, he was neglected by his father and step-mother, and soon learned the ways of vicious boys with whom he associated. After a little time at a boarding-school in Essex, he went to sea at the age of eleven. During the next six years he was exposed to the influence of atheistical books and companions. Reading Shaftesbury's *Characteristics* he became an infidel. In his 19th year he was unexpectedly promoted to the rank of a midshipman on board the *Havre* man-of-war. But in his self-will he abandoned the ship while she lay at Plymouth. He was caught, brought back, flogged, and degraded; but became only more hardened. In 1745 he set sail for India as a common sailor. Unable to endure the taunts of his messmates and the frowns of his superiors. he entered at Madeira a Guinea vessel which took him in exchange for another. In six months he left this ship and landed penniless on the African coast near Sierra Leone. He soon found employment in the service of a slave-trader in one of the islands of the Plantanes, and was compelled to perform the most groveling drudgery. In a year the "stout English sailor was transformed into a spiritless, half-naked wretch, suffering under the effects of fever, shivering under the wind and wet of the rainy season, devouring the nauseous roots which he stole by night from the plantations, or the fish which he caught by the sea-shore, and exciting the contempt and even the pity of the meanest of the slaves." In 1747 an English captain arriving at Sierra Leone with orders from his father to bring him home found him "herding contentedly with the negroes in their low pleasures and gross superstitions." He sailed in Mar., 1748. The ship came near foundering in a terrible storm. His mind was awakened to serious thoughts. At the near prospect of death his skeptical indifference and blasphemous defiance deserted him. He prayed, he read the New Testament and Thomas-a-Kempis, and when the ship reached Ireland he was a changed man. In 1750 he married Mary Catlett. Soon afterwards he was appointed commander of an African slaver, and for four years continued in the slave trade, confessing that "he never had the least scruples as to its lawfulness," though afterwards he labored earnestly to expose its cruelties. During the intervals between his voyages while on shore, and on deck at sea, he studied Horace, Livy, and Erasmus. In 1754 a sudden attack of sickness led him to abandon a sea-faring life, and for 8 years he was tide-surveyor at Liverpool. At this time he studied Greek and Hebrew, and the best theological works in Latin, French, and English. In 1764 he was ordained, and appointed curate of the parish of Olney, where he remained 16 years. He entered heartily into the religious views and work of Wesley and Whitefield. At Olney he published *An Authentic Narrative of some Remarkable and Interesting Particulars in the Life of the Rev. John Newton.* Here too he formed an intimate friendship with Cowper, and in connection with him produced the *Olney Hymns.* Most of them were written by himself for the use of his congregation. In 1779 he was presented with the rectory of the united parishes of St. Mary Woolnoth and St. Mary Woolchurch Hau, London, where he remained till his death, continuing to preach three times a week, even when more than four-score years old, and sight, hearing and memory were fast failing. When entreated to stop, he exclaimed, "What! shall the old African blasphemer stop while he can speak?" His labors were very effective, and he contributed much to dispel the religious apathy of that age. His works besides *Olney Hymns*, were *Omicron's Letters; Review of Ecclesiastical History; Cardiphonia*, or *Utterances of the Heart; The Christian Character Exemplified; Letters to a Wife; Messiah*, being 50 discourses on the Scripture passages in the oratorio of the "Messiah;" *Letters to the Rev William Bull*, and numerous sermons, discourses, tracts, etc. His letters are beautiful specimens of clearness and simplicity, and rich in Christian experience. Though in his preface to the *Olney Hymns* he disclaims all pretension to being a poet, and claims only the "mediocrity of talent which might qualify him for usefulness to the weak and poor of his flock," yet his verses, being as he himself says, "the fruit and expression of his own experience," live in the memory and affection of Christians, and some find a place in our best collections of hymns. He was a leader in the evangelical party in the church of England.

NEWTON, John, b. Va., 1823. He was appointed second lieut. in the corps of engineers, July 1, 1842, on graduating from West Point military academy, where he acted as assistant professor of engineering 1843–46. The construction of fortifications and the improvement of rivers and harbors next employed his time at various points on the Atlantic coast and great lakes, and 14 years of continuous service secured his promotion to the rank of capt. He was chief engineer of the Utah expedition of 1858. All through the rebellion he was in active service, beginning as chief engineer of the department of

Pennsylvania, and later of Shenandoah. Then he was summoned to assist in constructing the defenses of Washington, and had command of a brigade. During the peninsular and Maryland campaigns of the army of the Potomac he was a brig.gen. of volunteers, and took part in the battles of Gaines Mill, Glendale, South Mountain, and Antietam, where he was brevetted lieut.col. Commanding a division, he was engaged at Fredericksburg, in the storming of Marye heights and battle of Salem, and his services at the battle of Gettysburg gave him the rank of brevet col., and the command of the 1st corps. In the invasion of Georgia he led a division of the army of the Cumberland through all the engagements preceding the capture of Atlanta, and Mar. 13, 1865, he was made brevet maj.gen. Since the war he has been occupied it strengthening the defenses of New York harbor, removing the obstacles to navigation at Hell Gate and other portions of the East river, and improving some of the harbors of lake Champlain, the channel between Staten Island and N. J., and the Hudson river. June 30, 1879, he attained the rank of col. in the corps of engineers.

NEWTON, Reginald Heber, D.D. See page 889.

NEWTON, Robert, 1780–1854; b. Roxby, Yorkshire, Eng. He was early brought under the influence of the Methodists, joining that church at the age of 17. In 1798 he was received by the British conference, and in 1803 was appointed to the Glasgow circuit, attending lectures on theology and philosophy at the same time at the university. Most of his time was spent in England and Scotland. In 1812 he was appointed to London, where he soon became distinguished for his eloquence, especially in behalf of the British and foreign Bible society. When he began his missionary work in England there were only 50 Wesleyan missionaries and 17,000 communicants; in a few years through his influence there were 350 missionaries and 100,000 communicants. His services were in great demand in England, Scotland, and Ireland. In Sheffield he did much to check the influence of Paine, which then prevailed among the working classes. From London he was sent to Wakefield, and thence to Liverpool. For 40 years he was known and honored in all the large towns and cities. He was four times elected president of the British conference, and for many years was its secretary. In 1839, at the centenary conference held in Liverpool, he was appointed delegate to the general conference of the Methodist Episcopal church of the United States. He preached in New York, April 26, 1840, to a large audience, and wherever he preached vast crowds were attracted by his eloquence. In Baltimore, where the conference was held, such multitudes gathered to hear him that he afterwards preached in Monument square to an audience, it is said, of 15,000. He published *Sermons on Special and Ordinary Occasions.*

NEWTON, Thomas, an English prelate of the 18th c., was b. at Lichfield, Jan. 1, 1704. He was educated at Westminster school, and afterwards at Trinity college, Cambridge, where he took the degree of M.A. in 1730, in which year also he was ordained priest. After holding several minor preferments, he was made bishop of Bristol in 1761, and died Feb. 14, 1782. Without any remarkable merit, Newton has, one cannot well say how, succeeded in obtaining a place in literary history. His two productions, whose fortunes have surpassed their deserts, are an edition of *Milton's Paradise Lost* (2 vols., 1749), with a memoir of the poet, and critical and explanatory notes; and *Dissertations on the Prophecies* (3 vols., 1754 to 1758). Besides these, he wrote occasional sermons, and a host of scriptural dissertations, the theology of which is reckoned not always "orthodox."

NEWTON, William Wilberforce. See page 889.

NEWTON-ABBOT, a market t. of England, in the co. of Devon, beautifully situated in a vale on the river Lemon, 15 m. s.s.w. of Exeter. The portion of the town called Newton-Bushel is on the left side of the stream. It has been undergoing considerable improvements within recent years. William of Orange, after landing at Torbay, in 1688, made his first public declaration here. Pop. '71, 6,082.

NEWTON-IN-MAKERFIELD, a thriving manufacturing and market t. of England, in Lancashire, 15 m. w. of Manchester, on the Manchester and Liverpool railway. Two large iron foundries, as well as printing, paper, and sugar works, an oil-distillery, and a brick, tile, and pot manufactory are in full operation. There is a beautiful lake in the town called Newton Mere, which is covered during the summer months with the pleasure-boats of the townspeople. Horse-races are held here in June, and horse and cattle fairs in May and August annually. The election of M.P.'s for South Lancashire takes place in Newton. Cotton and flour mills, iron foundries and glass-works are in operation, and bricks are made. Pop.'81, 10,580.

NEWTON'S RINGS. In his investigations of the colors produced by thin plates of any material, solid, fluid or gaseous, sir Isaac Newton hit upon the following mode of exhibiting the colors produced by a film of air. He took two lenses, one convexo-plane, its convex side having a radius of 14 ft., the other equi-convex, with the radii of its surfaces 50 ft., and laid the first with its plane surface downwards on the top of the second, thus producing a thin film of air between the lenses; the film being thinnest near the center, and becoming gradually thicker outwards. On slowly pressing the upper lens against the under one, a number of concentric colored rings, having the point of contact of the lenses for their center, appeared, and increased in size when the pressure was increased. These rings, or more properly systems of rings, are seven in number, and each of them is composed of a number (ranging from 8 in the first or smallest ring, to

2 in the outermost) of rings of different colors, the colors, though different in each of the systems of rings, preserving the same arrangements as the colors of the spectrum, of which they seem to be modifications; thus, in the second ring the inside color is violet, and the outside scarlet red. The colors are very distinct in the first three systems of rings, but become gradually confused and dull towards the outside, till they almost fade away in the 7th system. The center is deep black. The thickness of the air-film at the center is about half a millionth of an inch, and increases gradually to nearly $\frac{1}{130,000}$ of an inch, when the colors disappear.

NEWTON THEOLOGICAL INSTITUTION, at Newton, Mass.; organized, 1825; the first theological seminary established in the country by the Baptist denomination, and has always been served by professors eminent for learning and piety. The buildings and grounds, valued at $135,000, occupy the summit of a hill commanding a fine view. It has an endowment of over $313,000, and a library of 18,000 volumes. President, rev. Alvah Hovey, D.D., LL.D.

NEWTON-UPON-AYR, a burgh of barony and parish of Scotland, in the co. of Ayr, on the n. side of the river Ayr, and united with the town of that name by three bridges. See AYR. Its population is included in that of Ayr. Newton-upon-Ayr has ship-building docks, roperies, and iron and brass foundries. It exports 100,000 tons of coal annually.

NEWTOWN, Conn. See page 889.

NEWTOWN, a t. in s. New York, on the w. extremity of Long Island, in Queens co.; pop. '80, 9,804. It is on the Flushing, North Shore and Central railroad, and formerly included Hunter's Point and Astoria; within its present limits are the villages of Corona, Maspeth, Columbusville, Glendale, Melvina, Newtown, and Ravenswood. Its n.e. boundary is an estuary of Long Island sound, its w. the city of Brooklyn, and it is bounded on the n.w. by the East river; 5 m. from New York. It has institutions of learning of high order, 22 churches, and a savings bank. Its surroundings offer many attractions. Market gardening is an occupation very generally followed; other industries are the manufacture of rope and oil-cloth, and it has an extensive iron foundry.

NEWTOWN, a modern manufacturing t. of North Wales, in the co. of Montgomery, 8 m. s.w. of the town of that name, on the right bank of the Severn, and on the Montgomery canal, which connects it with the inland navigation of the country. It is the center of the flannel manufactures of the county. It has 40 factories employing in all 960 men. Pop. '81, 7,170.

NEWTOWNARDS, a market t. of the co. Down, Ireland, 12 m. e. from Belfast by railway. Pop. '81, 8,678. It contains a court-house, a town-hall, and a market-square; a Protestant church, a Roman Catholic chapel, seven Presbyterian meeting-houses, numerous schools, and a union workhouse. It is a neat and well-built town, of considerable trade, and with extensive muslin, flax-spinning, and weaving factories. Since the union, it has ceased to be a parliamentary borough. The affairs of the town are administered by commissioners.

NEWTOWN-LIMAVADY (Ir. *Leim-a-madha*, "The Dog's Leap"), a market t. of the co. of Londonderry, Ireland, and 16 m. e.n.e. of the town of Londonderry. Pop. in 1881, 2,954. Newtown-Limavady, in the period anterior to the establishment of English rule, was the seat of the powerful sept of the O'Cahans, or O'Kanes; and during the wars of the revolution it was the scene of more than one struggle between the followers of James II. and those of William. Its chief importance at present is as a center of the flax trade, once the staple of that district, and again rising in importance. It possesses a town-hall, weaving factory, extensive flour-mills, markets, and brewery; union workhouse, Protestant church and other places of worship, and two comfortable hotels.

NEW WESTMINSTER, a t. in central British Columbia, on Fraser's river in the midst of the gold region, the former capital and one of the chief towns of the province; pop. 2,000, including Indians and half-breeds. It is 15 m. above the mouth of the river, 65 m. n.e. of Victoria, and 100 m. from Yale, at the head of river navigation. The river empties into the gulf of Georgia, and steamers from Vancouver island make this place a freight and passenger station for ocean steamers, whence the river steamers forward them to Yale. Between this place and Victoria steamers run twice a week. The river at this point is about a mile wide, and contains several inhabited islands. The town is the center of considerable tracts of arable land, delightfully located, has a fine climate and a large rainfall; and the vicinity is a silver producing region, though mines are not yet opened. Its leading industry is salmon fishing, several establishments largely exporting the fish in cans and barrels; and other kinds of fish are caught for this trade, and for the manufacture of fish oil. It has also a large trade in lumber and furs. Anthracite and bituminous coal are exported. It has five churches, good public schools, a Roman Catholic college, a young ladies' seminary directed by the sisters of St. Anne, and a public hospital. It contains a mint and assay office, a council hall, court-house, and public library, a jail and penitentiary. It supports 2 newspapers.

NEW-YEAR'S DAY, the first day of the year. The custom of celebrating by some religious observance, generally accompanied by festive rejoicing, the first day of the year, appears to have prevailed among most of the ancient nations. The Jews, the Egyptians, the Chinese, the Romans, and the Mohammedans, although differing as to

the time from which they reckoned the commencement of the year, all regarded it as a day of special interest. In Rome the year anciently began in March; and when Numa, according to the ancient legend, transferred it to Jan. 1st, that day was held sacred to *Janus Bifrons*, who was thus supposed to turn at once back upon the old year and forward into the new. On the establishment of Christianity, the usage of a solemn inauguration of the new year was retained; but considerable variety prevailed, both as to the time and as to the manner of its celebration. Christmas day, the annunciation (Mar. 25), Easter day, and Mar. 1 have all, at different times or places, shared with Jan. 1 the honor of opening the new year; nor was it till late in the 16th c. that Jan. 1 was universally accepted as the first day of the new year. The early fathers—Chrysostom, Ambrose, Augustine, Peter Chrysologus, and others—in reprobation of the immoral and superstitious observances of the pagan festival, prohibited in Christian use all festive celebration; and, on the contrary, directed that the Christian year should be opened with a day of prayer, fasting, and humiliation. The mandate, however, was but partially observed. The festal character of the day, generally speaking, was pertinaciously preserved, but the day was also observed as a day of prayer; and this character was the more readily attached to it when the year began with Jan. 1, as that day, being the 8th after the nativity of our Lord, was held to be the commemoration of his circumcision (Luke ii. 21).

The social observances of the first day of the new year appear to have been in substance the same in all ages. From the earliest recorded celebration, we find notice of feasting and the interchange of presents as usages of the day. Suetonius alludes to the bringing of presents to the capital; and Tacitus makes a similar reference to the practice of giving and receiving new-year's gifts. This custom was continued by the Christian kingdoms into which the western empire was divided. In England we find many examples of it, even as a part of the public expenditure of the court, so far down as the reign of Charles II.; and, as all our antiquarian writers mention, the custom of interchanging presents was common in all classes of society. In France and England it still subsists, although eclipsed in the latter country by the still more popular practice of Christmas gifts. In many countries, the night of New-Year's eve, "St. Sylvester's eve," was celebrated with great festivity, which was prolonged till after 12 o'clock, when the new year was ushered in with congratulations, complimentary visits, and mutual wishes for a happy new year. This is an ancient Scottish custom, which also prevails in many parts of Germany, where the form of wish—"Prosst- (for the Lat. *prosit*) Neu-jahr"—"May the new year be happy"—sufficiently attests the antiquity of the custom. In many places the practice of tolling bells at midnight, and thus "ringing in the new year" is still observed. Many religious communions are wont to celebrate it with a special service. In the Roman Catholic church, the *Te Deum* is still sung at the close of the old year; and New-Year's day is a holiday of strict obligation.

NEW YORK, one of the thirteen original states of the United States of America, now the most important in population and wealth, occupies an irregular triangular area from the Atlantic ocean to the great lakes, lat. 40° 29′ 40″ to 45° 0′ 42″ n., long. 71° 51′ to 79° 47′ 25″ w. The state is 412 m. from e. to w., 311 from n. to s., with an area of 47,000 sq. m., or 30,800,000 acres; bounded n. by lake Erie, lake Ontario, the river St. Lawrence, and Canada; e. by lake Champlain, and the states of Vermont, Massachusetts, and Connecticut, and by the Atlantic ocean; s. by the ocean, New Jersey, and Pennsylvania; w. by Pennsylvania, the Niagara river, and the lakes which make its irregular north-western boundary. The state has 60 counties. Its chief towns are New York city, Albany (the capital), Buffalo, Rochester, Oswego, Troy, Hudson, Syracuse, Utica, etc. Pop. '70, 4,373,068, of whom 1,000,000 are of foreign birth, 500,000 being Irish, and about 250,000 Germans. New York, though resting only one corner upon the Atlantic, has its sea-coast extended by Long Island, Staten Island, etc., to 246 m.; while it has a lake coast of 352 m., and borders for 281 m. on navigable rivers. The Hudson, broad and deep, with tides flowing 150 m., joins at Albany a system of canals, which connect New York city with the great western lakes and the river St. Lawrence. The state is also traversed by railway-lines in every direction. The center is beautified by many picturesque lakes, and its north-eastern portion and the banks of the Hudson by fine mountain scenery. The Blue Ridge of the Alleghanies form the highlands, whose peaks rise 1500 ft. from the Hudson; n. of these, the Catskills rise to a height of 3,800 ft., with a large hotel for summer visitors at an elevation of 2,000 ft.; while Mt. Marcy and Mt. Anthony, peaks of the Adirondacks, in the wild region w. of lake Champlain, are 5,337 and 5,000 ft. high. The chief rivers, besides the Niagara and St. Lawrence, are the Hudson, its chief branch the Mohawk, the Genesee, and the sources of the Delaware, Susquehanna, and Alleghany. Its geology presents a series of older rocks, from the azoic to the lower members of the carboniferous. Red sandstone of the middle secondary period is found on the borders of New Jersey; drift and bowlders are found everywhere; the great Silurian belt passes along the eastern line, and granite with iron occurs in the n.e. There is no coal, but rich beds of marble near New York city; productive salt-springs in the center of the state, which yielded, in 1874, 6,594,191 bushels; and petroleum and natural gas, enough in some cases to light large villages, in the w. Among the mineral springs, those of

Saratoga and Ballston have a wide reputation. The climate, mild on the coast, is cold in the northern counties. The soil, particularly of the western and limestone regions, is very fertile, producing the finest wheat, maize, apples, peaches, melons, grapes, etc., in abundance. In 1870, New York state produced 5,614,205 tons of hay, 12,178,462 bushels of wheat, 35,293,625 of oats, 16,462,825 of maize, 17,558,681 lbs. hops, 6,692,040 lbs. maple-sugar, 22,769,964 lbs. cheese, 10,599,225 lbs. wool. Among the natural curiosities are the falls of Niagara; of the Genesee, three cascades of 96, 25, and 84 ft. in 2½ m.; of the Trenton, which falls 200 ft. in 5 cascades; the Taghanic falls, of 230 ft.; and the oft-painted falls of the Cauterskill, 175 and 85 ft., in a gorge of the Catskill mountains. In 1870 there were 36,206 manufacturing establishments, employing 351,800 persons, and a capital of $366,994,320; and in 1875 there were 5,442 m. of railway in the state; the Erie canal is 350 m., and the New York canals together 855 m.; 351 banks of issue have a capital of $124,589,000. In 1870 there were 5,474 churches; 11,678 public schools, attended by 719,181 pupils; 274 classical, professional, and technical schools, including 7 universities, 24 colleges, and 189 academies, with an attendance of 43,728 pupils; and 1068 boarding and other schools, with an attendance of 99,113 pupils. In 1874 the expenditure for teachers and scholars was $11,088,981, and the total number of children at school, 1,224,321. The number of paupers supported during the year ending June 1, 1870, was 26,152, at a cost of $2,661,385. The number of persons convicted of crime during the same period was 5,473, of which 2,000 were foreign born. There were 835 newspapers and other periodicals—87 daily, 518 weekly, 163 monthly, 19 quarterly; but a large number of these are published in the city of New York, and circulated over the union. The number of copies issued annually in the state was 471,741,744. In 1874 there were 1055 newspapers and periodicals.

The earliest explorations of New York by Europeans were in 1609 by Hendrick Hudson, who took possession of the country on the river which bears his name for the Dutch; and by Champlain, a Frenchman, who explored lake Champlain from Canada. It was possessed by the Iroquois, or Five Nations, and the Algonquins. In 1621 the Dutch made a settlement on Manhattan Island, which they bought for $24, and founded New Amsterdam, now New York. In 1664, New York was taken by the English. In the war of independence (1776), Washington was driven from New York city, which was held by the British till the end of the war; but West Point was held, and Burgoyne, after two severe battles near Saratoga, compelled to surrender. The state constitution was adopted in 1777, and has since been repeatedly amended. The governor is elected for three years, 32 senators for two years, and 128 members of assembly for one year. In 1825 the opening of the Erie canal gave a great impetus to trade. Pop. (1800) 586,756; (1820) 1,372,812; (1860) 3,880,735; (1870) 4,382,759.

NEW YORK (*ante*). *History.*—While it is claimed that John de Verrazano landed on the coast of New York in 1524, the first white man who is known to have been within the present boundaries of the state, was Samuel Champlain, the French navigator, who set sail down the lake which was named after him, on July 4, 1609, antedating by two months Hudson's discovery from the sea. Champlain, governor of Canada, was on an expedition up the St. Lawrence, when he met a war-party of Hurons, which he and two other Frenchmen joined. July 5, at Crown Point, the Hurons met 200 Iroquois, and defeated them, Champlain shooting their chief with his arquebuse. This was the initiatory act which incurred the enmityof the Five Nations, with whom the French continued at war until the final surrender of their possessions in America. Sept. 9, 1609, Henry Hudson, an Englishman in the employ of the Dutch East India company, sailed his little 80-ton shallop *Half-Moon* into the waters of New York bay, and three days later commenced his voyage up the river to which his name is attached, which he explored to a point between Hudson and Albany. All the land which he discovered was claimed by the Dutch, and named New Netherland; and in 1611 the states-general offered special privileges to any company opening and encouraging trade with the natives of their newly acquired possessions. This encouragement procured not only trading but colonization. In 1613 a fort was built on Manhattan island, but the settlement about it was broken up by the English. In the following year another Dutch colony established itself on the same spot, and continued in possession; and during the ten years succeeding, the shores of the Hudson and those of Long Island sound were explored, and at fort Orange (Albany) another trading-post was established. In this region the Indians were tribes of the great Algonquin family, while the remainder of the state was occupied by the Five Nations. But while Champlain had embroiled himself with the Indians in the part of the country included in his explorations, thus entailing a long and bloody war upon the French, the Dutch settlers in the s.e., more wary, cultivated amity with the red men, to their own material advantage. In 1621 the prospects of a lucrative commerce with America had induced certain merchants in Holland to combine in the organization of the Dutch West India company, for colonization purposes, and two years later this company took out 18 families who settled at fort Orange, and 30 families who remained at New Amsterdam on Manhattan island.

The first important illustration of the benefits of amicable intercourse with the Indians occurred in the purchase from them of Manhattan island by the Dutch in 1626 for the sum of $24. This was accomplished by Peter Minuits, the director-general who had been

sent out by the Dutch West India company to take charge of its colonies, an able administrator and wise governor. See MINUITS, PETER. A feature of his administration was the establishment of the patroon system, by which certain speculators were permitted by an act of the company passed in 1629 to gain manorial rights over immense tracts of country; thus building up a powerful land aristocracy, whose influence was great in the early history of the state, and whose claims brought about more than two centuries later the "anti-rent" war between landlords and tenants in these manorial districts. The disturbance which this system immediately produced among the colonists themselves, being attributed wrongfully to maladministration on the part of Minuits, he was summoned home and his office filled, in 1633, by Wouter van Twiller, who was succeeded in 1638 by William Kieft. The administration of the latter was signalized by the first serious difficulty between the colonists and the Indians. Some slight disagreement brought about an attack on the natives by the Dutch, which resulted in the massacre of more than 100 unoffending Indians, men, women, and children, and the precipitation of a sanguinary war which threatened the very existence of the colony. Peter Stuyvesant succeeded Kieft in 1647, and his considerate and judicious direction of affairs relieved the latter from the serious danger into which it had fallen. He pursued a conciliatory policy with the Indians, and the wisdom of his administration soon produced its effect in a satisfactory and progressive condition in the settlements under his jurisdiction. These settlements now constantly extending, soon conflicted with those of the English on the Connecticut river, and of the Swedes on the Delaware. The latter had been established by Peter Minuits, who had joined the service of the Swedish government, after being dismissed from that of the Dutch West India company: in 1655 gov. Stuyvesant seized this settlement by force and annexed it to his government. The English opposition to the Dutch colonization schemes was persistent from the beginning, and fruitful of much conflict. The English claimed the territory n. of Virginia on the ground of the anterior discoveries by Cabot; and in 1664 a charter was granted by Charles II. to the duke of York, which covered all the lands lying between the Hudson and the Delaware, and included New Netherland, as well as lands already held by prior grant, by Connecticut, Massachusetts, and New Hampshire. In the summer of the year in which this charter was given, col. Nicolls was sent from England with sufficient force, and on arriving at New Amsterdam, demanded the surrender of the Dutch possessions. This demand was acceded to by gov. Stuyvesant, who was powerless to prevent its enforcement, and the country in question passed into the hands of the English without a struggle. The name New York was now given both to the settlement on Manhattan island and to the entire province, and that of Albany to fort Orange. A subsequent recapture by the Dutch was followed by speedy restoration to the English; and on the duke of York ascending the throne of England under the title of James II., the province passed into the possession of the crown. Its condition at this time was not encouraging as to progress, either in wealth or education. The most of the land was held by aristocratic families, much of it having been dispensed by the duke of York among his favorites. Heavy taxation and burdensome restrictions on trade bore heavily on the people; there was little political freedom or religious toleration; even under the reign of William and Mary there was little improvement. Colonial possessions, according to the general policy of the European powers, were used to placate or dispose of personal enemies, or to reward personal friends; while their trade was deemed a just perquisite for the royal exchequer. So late as 1689, the persistent tyranny of Nicholson, governor of New York, aroused the colonists to resistance; and Jacob Leisler, a merchant of prominence in New York, and in an official position, seized the government in the name of William of Orange, and held it for two years. He was then superseded by gov. Sloughter, and on very insignificant grounds was tried for high treason, condemned, and put to death. See LEISLER, JACOB.

While the Dutch and English were colonizing s.e. New York and the line of the Hudson river, also at points some distance in the interior and on lake Champlain, the French were incessant in their warfare with the Indians and their inroads from Canada into northern and central New York, varying their warlike expeditions by missionary enterprises. Excepting brief periods of peace, established by treaty stipulations often broken, the French and Indians were constantly at enmity; while the generally friendly relations of the natives with the English resulted in the northern and western frontier settlements being protected by the Indians from French invasion during the French and Indian wars. After 1684, when gov. Dongan concluded an offensive and defensive treaty with the Indians, the English occupied, in peaceful agreement with the latter, the attitude which had been held by the Dutch prior to their ascendency. In 1687 a French army under de Nonville, governor of Canada, invaded New York; the Five Nations, in retaliation, made an invasion of Canada two years afterwards, killing 1000 French settlers, and threatening the destruction of the whole province. On Feb. 8, 1691, at midnight, the town of Schenectady was attacked by French regulars to the number of more than 200, accompanied by a large number of Indians, when 63 of the settlers were killed, and 27 carried into captivity. In 1690–91 the village of La Prairie was twice attacked; and in 1695 count de Frontenac, with 400 Frenchmen and 250 Algonquins, desolated the Mohawk country, and pursued his invasion almost to Albany, returning laden with plunder and prisoners. Lake Champlain was, in fact, held by the French and commanded by their fortifications until 1759. Hostilities between England and France were con-

cluded for the time by the peace of Ryswick in 1697, and from 1702 to 1748, during queen Anne's and king George's wars, there was no fighting in New York, except skirmishes along the frontier. But after the outbreak of hostilities in 1754, there being no concert of action among the colonies, the entire British possessions in North America were threatened with subjugation. The French had fortifications on lake Champlain, on the St. Lawrence, and at Niagara; while the English advanced posts were at fort Edward on the Hudson, and at Oswego. In 1755 the English under sir William Johnson defeated and nearly annihilated the French under Dieskau, at the head of lake George; but in the following year the French captured Oswego and destroyed it, and in 1757 took fort William Henry. In 1758 gen. Abercrombie, with an army of 16,000 men, attacked Ticonderoga, but was repulsed. Col. Bradstreet, however, captured fort Frontenac in the latter year, and in 1759 Niagara was captured by the British, and Ticonderoga and Crown Point surrendered on the appearance of gen. Amherst with his army. This left New York free of the French, and the attention of its people could once more be turned to their own affairs. During the war, and under William Pitt's administration, colonial affairs had been administered less obnoxiously than before; but no sooner was the conquest of Canada completed, than a course of conduct was begun tending to irritate the colonists, and arousing in New York a spirit of opposition whose exhibition the presence of a large royalist force could not prevent.

New York joined earnestly in the arrangements made for self-defense on the part of the colonies. In Oct., 1775, gen. Tryon, the last British governor of New York, fled from his seat of government on board a man-of-war. Already, in May of that year, Ethan Allen and his "Green Mountain boys" had surprised and captured fort Ticonderoga. Generals Montgomery and Schuyler set forth two months later on their ill-fated expedition against Canada—whence they returned defeated and dispirited in the following spring. In Feb., 1776, New York city was occupied by an American force, but the battles of Long Island and Harlem heights, disastrous to the American arms, rendered that position untenable; and, being abandoned by Washington and his army, the British took possession of the city, and held it for 7 years. In the summer of 1777 the province was invaded by gen. Burgoyne from the Canada side, while simultaneously a British force proceeded up the Hudson to unite with him. The immediate result of this joint expedition was the capture by the British of several American forts on the Hudson and lake Champlain, but it ended in disaster, Burgoyne's entire army being forced to surrender, Oct. 17, at Saratoga. In 1777–78 West Point was fortified, and considered the strongest position in the country.

In 1779 the Indian country in New York was laid waste by gen. Sullivan; the Six Nations joined the British, and under sir John Johnson harassed the defenseless settlements on the frontier; and the Schoharie and Mohawk settlements were constantly being subjected to depredations on the part of hostile Indians. Nov. 25, 1783, the final act of the revolution took place in the evacuation by the British of the city of New York, when the colonists were left to frame a government for themselves, which should comprehend the new attitude and larger relations which they held as citizens of a republic. A treaty was now concluded with the Six Nations, the Indians ceding a large portion of their lands to the state. Subsequently other treaties lessened the Indian possessions, until, excepting the reservations, all that they had once owned had been given up to the whites. What was known as the "Holland purchase," 3,500,000 acres sold by Robert Morris to an Amsterdam company—lying west of what was known as the preëmption line, a boundary between New York and Massachusetts lands—having been thoroughly surveyed by its Dutch owners, and made available for settlement, was speedily populated. The lands in central New York were settled as rapidly as the Indians surrendered them. In 1777 the first constitution of the state was adopted, revised in 1801, 1821, 1846, and 1867, the latest amendment having been made in 1874. In the meantime conflicting claims of other states concerning the boundaries of New York had been adjusted amicably; in the case of New Hampshire, by forming the state of Vermont from the disputed territory, New York receiving the sum of $30,000 for relinquishing its claim. The war of 1812 brought the New York frontier again into danger, and a number of engagements occurred in that part of the state bordering on Canada and the lakes. A British attack on Sackett's Harbor, an important American naval station on lake Ontario, resulted unsuccessfully.

Shortly after the close of the war, in 1816, the requisite legislative action was taken for the building of the Erie canal, originally suggested by Gouverneur Morris in 1800. The canal was begun in 1817 and finished in 1825; its successful completion being mainly due to the energy and foresight of gov. De Witt Clinton. The effect of this great work was to enrich the state while opening the way for the stream of commerce which has resulted in making the city of New York the metropolis of the western continent. In 1826 the Hudson and Mohawk railroad was chartered—probably the first railroad charter granted in the country. This road was commenced in 1830, and the New York and Erie in 1836. The gradual absorption of the various New York lines which form the Hudson river railroad, and the consolidation of the New York Central and Hudson river railroad into one powerful four-track trunk line connecting the metropolis with the west, were significant events in the development of the state.

The part taken by the state of New York in the war for the Union was foremost, as became the first state in the union in wealth and population. Every county furnished

its quota of volunteers; its well-organized and thoroughly drilled militia regiments supplied capable officers to the inexperienced army which was so rapidly formed, and the great manufactories of the state were kept busy night and day in supplying arms, clothing, and equipments; at the Watervliet arsenal alone 1500 men were employed during the war. The wealth of New York was poured out like water to sustain the union cause. The United States sanitary commission and the union defense committee were organized from among its citizens.

Government.—"The Dutch political system made the judiciary supreme, and denied all arbitrary power, either in people or parliaments, in civil rulers or religious teachers, and sought to fortify the people against its exercise. Thus the feudal shell of Dutch government inclosed the seed of liberty, ready in fullness of time to germinate in most perfect form." A government was actually established for the first in New Netherland in 1624, after the arrival of a party of Walloons sent out by the Dutch West India company, under the direction of capt. Cornelis Jacobsen May, who preceded Minuits as director. In 1629 the manorial system was introduced, the patroons being invested with the authority of feudal barons, but no political or judicial changes could be introduced without consent of the home government. In 1638 and 1640 the privileges of the patroons were materially restricted and those of free settlers enlarged. Whenever the people settled in sufficient numbers, the company was obliged to give them local government, the officers of which were to be designated by the director and council, in accordance with the custom in the Netherland. But although by the plan of government "no other religion was to be publicly tolerated or allowed in New Netherland, save that then taught and exercised by authority of the Reformed church in the united provinces,"this provision was a dead letter. English colonists were already settled on Gardner's island, and at Southampton and Southold, at the eastern extremity of Long Island (1639–40), and others in Westchester and at Gravenzande. On the outbreak of the Indian war in 1641, director Kieft invited all the masters and heads of families of New Amsterdam and its vicinity to assemble in the fort on a given day, this being the first official recognition of the existence of the people in New Netherland. When these freemen convened, they gave their opinion on the questions before them, and appointed twelve men to continue to represent their interests. These twelve men proceeded to demand certain reforms of government, but were reminded by the director that they had only been appointed to consider the Indian troubles. They were again called together in 1643, when larger liberties were accorded them, and finally eight men were elected by the director, who became an actual representative body. Gov. Stuyvesant continued this plan, by appointing nine men, who were "tribunes" of the people, to hold weekly courts of arbitration, and advise the director and council. Troubles afterwards grew out of the demands of the tribunes for a burgher government, and these were referred to the states-general for decision, and a more liberal form of government was ordered, to which order Stuyvesant paid no attention. The Dutch governor continued to oppose the efforts of the people for greater liberty, until his forced surrender to the English cut short his prerogative. Under Nicolls and Andros, the people of New York found themselves in a worse position than under the Dutch governors, but gov. Dongan convened the first general assembly of the colony, which passed the act entitled "Charter of Liberties and Privileges granted by His Royal Highness to the Inhabitants of New York and its Dependencies," and by which legislative power was granted to the colony, James II. abolished this general assembly, and endeavored to unite all the colonies as the dominion of New England, under gov. Andros. William and Mary revived the general assembly, and granted to the people of New York a certain degree of freedom; but the struggle between the colonists and the crown continued until the final revolution in all the colonies resulted in the expulsion of English authority. The provincial convention which met in New York, April 20, 1775, was the first organized body in the colony after the overthrow of royal authority, the latter having been declared to have come to an end in the colony on April 19. The first constitution of the state of New York was adopted April 20, 1777. The articles of confederation of the continental congress were ratified by the state, Feb. 6, 1778. The constitution of the United States was ratified by the state July 26, 1787. The present executive government of the state of New York comprises a governor, lieutenant-governor, secretary of state, comptroller, treasurer, attorney-general, state engineer and surveyor, superintendent of the bank department, superintendent of the insurance department, superintendent of public instruction, auditor of the canal department, superintendent of state prisons, superintendent of public works, besides the governor's staff, and various boards and commissions for charity, lunacy, quarantine, etc. The names of the governors of the state from 1777 to 1881, inclusive, in order, are as follows: George Clinton, John Jay, George Clinton, Morgan Lewis, Daniel D. Tompkins, De Witt Clinton, Joseph C. Yates, De Witt Clinton, Martin Van Buren, Enos J. Throop, William L. Marcy, William H. Seward, William C. Bouck, Silas Wright, John Young, Hamilton Fish, Washington Hunt, Horatio Seymour, Myron H. Clark, John A. King, Edwin D. Morgan, Horatio Seymour, Reuben E. Fenton, John T. Hoffman, John A. Dix, Samuel J. Tilden, Lucius Robinson, Alonzo B. Cornell. The legislative branch of the state government includes a senate and assembly; the senate consists of 32 members, elected in November of every alternate year (1881, 1883, etc.), holding their offices for two years from the first of January next succeeding. The state is divided into 32 senatorial districts, each electing one senator. The senators receive an

annual salary of $1500, and also $1 for each ten miles of travel in going to or returning from the place of meeting once in each session. Ten dollars per day in addition is allowed when the senate alone is convened in extraordinary session, or when acting as a court for the trial of impeachments. The lieutenant-governor is *ex officio* president of the senate. The assembly consists of 128 members, elected annually by single districts. Each county has at least one member. They receive the same compensation as senators. Their officers are chosen at the opening of the session.

POPULATION OF COUNTIES, 1870, 1880.

White, 5,016,022; Colored, 66,849, including 819 Indians, and 909 Chinese.

Geography.—The outlines of the state are exceedingly irregular, but its river, lake, and ocean boundaries are nearly all navigable, including 352 m. on the lakes; 281¼ m. on the St. Lawrence, Poultney, Hudson, Kill van Kull, Delaware, and Niagara rivers; and 246 m. on Long Island sound and the Atlantic ocean. The total extent of the boundary-lines on the border of Canada, Vermont, Massachusetts, Connecticut, New Jersey, and Pennsylvania is 541.28 miles. The chief harbors are New York bay and harbor; Dunkirk and Buffalo, on lake Erie; Tonawanda and Lewiston, on Niagara river; Genesee, Sodus, Oswego, Sackett's Harbor, and Cape Vincent, on lake Ontario; Ogdensburg, on the St. Lawrence; Rouse's Point, Plattsburg, and Whitehall, on lake Champlain; and Sag Harbor, at the e. end of Long Island, with other harbors on the n. and s. shores of that island. The principal rivers are the Hudson, Mohawk, Oswego, Allegnany, Susquehanna, and Delaware, with numerous branches and tributaries. The state is noted for the number and beauty of its lakes, among which are Chautauqua, Cattaraugus, Hemlock, Honeoye, Canadice, Conesus, Crooked, Canandaigua, Seneca, Cayuga, Owasco, Skaneateles, Cross, Onondaga, Otiseo, Cazenovia, Oneida, Otsego, Schuyler, Schroon, George, Avalanche, Colden, Henderson, Sandford, Eckford, Racket, Forked, Newcomb, Long, Saranac (upper and lower), Tupper's, Rich, Pleasant, besides the great lakes and lake Champlain. Three mountain ranges, entering the state from the s., cross it in a n.e. direction. The first of these, a continuation of the Blue Ridge, runs through Rockland, Orange, Putnam, and Dutchess counties, and forms the highlands of the Hudson. Its highest peaks are Beacon hill, Dutchess co., 1685 ft.; Bull hill, Putnam co., 1586 ft.; Butter hill, Orange co., 1529 ft.; Old Beacon, Putnam co., 1471 ft.; Crow Nest, Orange co., 1418 ft.; Bear Mount, Orange co., 1350 ft.; Anthony's Nose, Putnam co., 1228 feet; and Breakneck, Orange Co., 1187 ft. The second range extends through Sullivan, Ulster, and Greene counties, terminating in the Catskill mountains on the Hudson. Its highest peaks are Round Top, 3,804 ft.; High Peak, 3,718 ft.; and Pine Orchard, 3,000 ft.—all in Greene co.; and Rockland mount, 2,400 ft., and Walnut hill, 1980 ft., in Sullivan county. The Shawangunk mountains are the extreme e. spur of this range, and the Helderberg and Hellibark mountains extend from it north into Albany and Schoharie counties. The third range extends through Broome, Delaware, Otsego, Schoharie, Montgomery, and Herkimer counties to the Mohawk; and reappearing on the n. side of that river, continues to lake Champlain, forming the Adirondack mountain region. Geographically, the Adirondack region is bounded by lake Champlain, the St. Lawrence, the Mohawk, and the Black rivers. This extensive territory contains the only great forests remaining as a public domain within the borders of the state The first surveys of this territory were made in 1772, but it was precisely 100 years later that a systematic topographical survey of the entire region was undertaken by acts of the legislature. The Adirondacks are geologically described as "igneous, plutonic mountains—the

rocks generally metamorphic, granite, and gneiss, with feldspar and hornblende." The principal peaks are mount Marcy, 5,402 ft.; mount Clinton, 4,937 ft.; MacIntyre, 5,106 ft.; Wight; Skylight, 4,997 ft.; Haystack, 5,006 ft.; Colden; Dix; Blue; Gothic, 4,744 ft.; Giant of the Valley, 4,o30 feet. The lake and river levels here have an altitude of 1500 to 2,000 ft., and the climate is much more severe than in the lowlands of the same latitude. Here are extensive beds of iron ore, some of which have been worked: the average annual yield of the entire region is 30,000 tons. The fauna of the Adirondacks is very rich, affording the panther, lynx, sable, ermine, deer, black bear, rabbits, squirrels, and birds in large variety. This part of the state is accessible from Saratoga by the Adirondack railroad, and stage from North creek to Blue Mountain lake; thence by small steamboats to Raquette lake; also from Plattsburg to the Saranac lakes by railroad and stage.—Of cataracts in the state, Niagara Falls, in the outlet of the four great upper lakes, are 164 ft. high and 1100 wide on the American side, and 2,000 ft. wide on the Canadian side; the total descent being 333 ft., and the width of the river below the falls 1000 feet. The Genesee river has a descent of 260 ft. in three falls within the space of two miles near its source, and there are other falls near Rochester with a descent of 200 feet. Trenton Falls are a succession of five cascades, having 200 ft. of fall in a course of two-thirds of a mile. Cohoes and Little Falls, in the Mohawk, form grand cataracts in times of freshet. In the Catskills a small stream is precipitated down a ledge 180 ft. high.—The water-shed that separates the n. from the s. drainage of w. New York extends in an irregular line through the southerly counties. The country s. of this water-shed, embracing the most of the two s. tiers of counties, is nearly all a hilly country. North of the water-shed the surface descends in rolling and smooth terraces toward lake Ontario, the region between the hills of the s. and the level lands of the n. being a beautiful, rolling country. The river system of the state comprises that part drained by the great lakes and the St. Lawrence, northerly, and that drained by the Hudson and other rivers, southerly. The water-shed between extends irregularly from lake Erie eastward through the s. tier of counties to the Adirondack mountains, lake George, and the state line, east.

Agriculture.—Most of the crops and fruits of the temperate zone can be raised in New York. More than half of the total area of the state is improved, and under successful cultivation.

TABLE OF VALUES OF FARM PRODUCTS: CENSUS OF 1870 AND OF 1880 COMPARED.

Crops, etc.	Census of 1870.	Census of 1880.	Crops, Stocks, etc.	Census of 1870.	Census of 1880.
Value of Farms	$1,272,857,766	$1,056,176,741	Tobacco for year, lbs	2,349,798	6,481,431
Value of farming implements, etc	45,997,712	42,592,741	Maple sugar for year, lbs	6,692,040	10,693,619
Value of farm products for year	253,526,153	178,025,695	Sorghum and maple syrup, gallons	53,880	267,524
Animals slaughtered or sold for slaughter	28,225,720	.....	Irish potatoes, bushels	28,547,593	33,644,807
Home manufactures	1,621,621	.....	Peas and beans, bushels	1,152,541	1,569,541
Forest products	6,689,179	8,759,901	Beeswax, lbs	86,333	79,756
Market-gard'n products	3,432,354	4,211,642	Honey, lbs	896,286	2,088,845
Orchard products	8,347,417	8,409,794	Value of all live stock	$175,882,712	$117,868,283
Wages paid for farm labor, including board	34,451,362	.....	Number of horses	856,241	610,358
Wheat for year, bushels	12,178,462	11,587,766	Number of mules and asses	4,407	5,072
Rye for year, bushels	2,478,125	2,634,690	Number of milch cows	1,350,661	1,437,855
Ind'n corn for y'r, bush.	16,462,825	25,690.156	Number of working oxen	64,141	39,633
Oats for year, bushels	35,293,625	37,575,506	Number of other cattle	671,428	862,233
Barley for year, bushels	7,434,621	7,792,062	Number of sheep	2,181,578	1,715,180
Buckw't for year, bush.	3,904,030	4.461,200	Number of swine	518,251	751,907
Flax for year, lbs	3,670,818	843,965	Dairy products, butter, lbs	107,147,526	111,922,423
Wool for year, lbs	10,599,225	8,827,195	Dairy products, cheese, lbs	22,769,964	8,562,590
Hops for year, lbs	17,558,681	21,628,931	Milk sold, gallons	135,775,919	231,965,533
Hay for year, tons	5,614,205	5,240,563	.....	.....	.....

The yield of the various crops for the year 1883 was as follows :

Products.	Quantity produced.	Ave. yield per acre.	No. of acres in each crop.	Value per bush., lb., or ton.	Total Valuation.
Indian corn, bushels	17,512,700	23.0	761,423	$0.73	$12,784,271
Wheat, bushels	8,035,200	10.3	780,124	1.11	8,919,072
Rye, bushels	2,703.816	11.2	241,685	.72	1,946,748
Oats, bushels	42,071,400	31.3	1,344,637	.40	16,828,560

The average value per acre of cleared lands in New York in 1880 was $58.48; the average value of timbered lands, $40.88; the average increase in value of both classes in one year being 4.7 per cent.

In the northern counties and the highland regions along the s. border and upon the Hudson, stock and sheep raising and dairy farming are pursued; while the lowlands that form the greater part of the surface of the w. portion of the state are best adapted to grain growing. Broom corn has long been the staple crop of the Mohawk valley intervals, tobacco being extensively raised in the Chemung valley and parts of Onondaga and Wayne counties; hops have been an important crop in Madison, Oneida, Otsego, and Scholarie counties; grapes have been successfully cultivated in the valley of the Hudson below the highlands, on the n. shore of Long Island, and in several of the lake valleys in the central part of the state. Maple sugar is an important product of northern and central New York; and fruits, including apples, peaches, pears, and strawberries, are largely grown in the western counties n. of the water-shed; while latterly peaches have begun to be an important crop in Ulster county. Large tracts of land in the vicinity of New York city, and particularly on Long Island, are devoted to market gardening and dairying, and the inhabitants supply milk, butter, cheese, eggs, vegetables and small fruit to the markets of the metropolis.

The climate of New York is varied, with a range wider than any other state. Those portions which are under the influence of the ocean, sound, and lake winds, are more even in temperature, and suffer less severely from the late frosts of spring and the early frosts of autumn, and from summer heats, than portions of the country in the same latitude not thus influenced. The mean temperature of the state, as determined from observations made during 25 years, is 46.49°. The mean length of the season of vegetation from the first blooming of apples to the first killing frost is 174 days; though on Long Island it is 12½ days longer, and in St. Lawrence co. 22 days shorter. The mean annual fall of water in rain and snow is 40.93 inches.

The principal mineral and medicinal springs of the state are the salt springs of Onondaga co., from which more than 7,000,000 bushels of salt are made annually; Saratoga springs; New Lebanon, and Stockport, Columbia co.; Massena, St. Lawrence co.; Richfield, Otsego co.; Avon, Livingston co.; Clifton, Ontario co.; Sharon, Schoharie co.; Chittenango, Madison co.; and Alabama, Genesee county.

Geology.—With few exceptions the later rock formations are not represented in New York, but a very complete series of the older groups are found, from the azoic up to the lower members of the carboniferous. From n.e. New Jersey, extending over Rockland co., and terminating at the trap formation known as the Palisades, on the w. side of Tappan bay in the Hudson, is the red sandstone of the middle secondary. On the borders of the St. Lawrence and lake Champlain are some tertiary deposits of the pliocene period; and the drift or bowlder formation overruns the whole state, being developed over Long Island in beds of sand, gravel, and clays, so deep that the rocky ledges are everywhere concealed from sight, except at a few points where the gneiss is laid bare on the shore of the East river opposite New York island. The great metamorphic belt of the eastern states passes into New York all along its eastern line, and to the n. of the Mohawk river branches off over nearly all the rough country lying between lakes Ontario and Champlain. In this district are the Adirondack mountains. The granitic and hypersthene rocks of which they consist spread almost to the St. Lawrence, from which the tract is separated by a belt of the Potsdam sandstone, which passes through Potsdam in St. Lawrence co., and surrounds the great district of azoic rocks on its n. and w. sides; and next to this, bordering the St. Lawrence, the calciferous sand-rock overlies the Potsdam sandstone. The birdseye, Black river, and Trenton limestones of the next upper group of rocks lie in Jefferson co. on the e. end of lake Ontario, and along the s.w. border of the azoic district through Lewis co. and into Herkimer county. The region thus surrounded is the great iron-ore district of n. New York. Beds of magnetic and specular iron ores are worked near lake Champlain and in the s.w. part of St. Lawrence co.; and in the latter neighborhood are also the most promising lead mines e. of Wisconsin. The region e. of the Hudson river consists of the lower members of the New York system of rocks more or less metamorphosed, the sandstone passing into quartz rock; blue stratified limestone into the crystalline and white marbles; and the argillaceous slates of the Hudson river group into silicious, talcose, and micaceous slates. The unaltered Silurian rocks cross the Hudson river in a belt reaching from the lower corner of Dutchess co. to Rondout in Ulster co., and extend into the n.e. portion of New Jersey. The metamorphic formations, comprising the slates and gneiss with occasional beds of crystalline limestone or marble, occupy the counties of Putnam and Westchester, and the s.e. portion of Orange county. New York island consists of gneiss, and the same formation extends across Staten island, and reappears in the neighborhood of Trenton, N. J. Along its s.e. half this formation is covered by the secondary red sandstone, which from Tappan bay crosses Rockland co. and New Jersey into Pennsylvania. This group contains valuable beds of hematite iron ore. In the highlands are also many beds of magnetic iron ore, and there are numerous beds of white marble. It is in the Hudson river slates or lower Silurian limestones that the mineral springs of Ballston, Saratoga, and Sharon are found. In Delaware, Greene, Sullivan, and parts of Ulster and Broome counties the red and gray sandstones of the Catskill group overlay the Portage and Chemung series of sandstones, slates, and shales; and upon some of the Catskills, and at a few points in Delaware and Sullivan counties, the millstone grit or conglomerate, which forms the floor of the coal formation, caps the highest summits. Only about 100 ft. more of height was needed to reach one or more of the lower coal-beds, and this is as near the carboniferous formation as is reached in New York, though in Pennsylvania coal-beds are formed within 6 m. of the state line. The Portage, underlying the shales of the Chemung, is composed of thin-bedded gray and bluish close-grained sandstones. These are quarried in Ulster, Greene, Albany, and Seneca counties, and to the amount of several million ft. annually are sent to New York for flagging. This formation also yields grindstones. In the w. part of the state the sandstones are bituminous; and at a number of places in Alleghany, Cattaraugus, and Chautauqua counties, springs of petroleum issue from the rocks of this group, sometimes accompanied by jets of carbureted hydrogen gas. The rock formations from the Potsdam sandstone up, with their various subdivisions, constitute what is known as the New York system, and with the carboniferous group complete the Appalachian system. In this state the formations below the carboniferous are very fully developed, and are particularly rich in fossils. At Trenton falls, the ravine is cut through the Trenton limestone formation of the transition period, which contains trilobites, nautili, and other fossils of interest.

The population of the state by the census of 1880 was 5,083,810. The following table shows the changes and the classification of the population since 1790:

TABLE OF POPULATION OF THE STATE OF NEW YORK, 1790 TO 1880.

Census year.	Total population.	Male.	Female.	White.	Free colored.	Slave.	Native.

The state capitol at Albany, begun in 1871, had cost in 1883 over $15,000,000, and it was estimated that when fully completed it would cost $20,000, and that the yearly expense of keeping it in order would be $75,000. It is built of Maine granite, in the Renaissance style of architecture, with dome-capped tower, 320 feet high; is certainly the most pretentions building in the U. S., and with the exception of the capitol at Washington is the largest. It was first occupied by the legislature in 1879. In 1883 the old capitol and state library building were demolished and their libraries removed to the new building.

The prisons of the state are at Clinton, Auburn, and Sing Sing. There are also six penitentiaries, not to mention county-jails, houses of refuge, etc.; the total number confined yearly, averaging about 16,000 persons. The number of large towns and the fact that New York city is the chief landing place for emigrants account easily for the large criminal class, which is one-fifth of the entire population. The state reformatory at Elmira has excited much interest by reason of the novel treatment of its inmates; the men are subject to a system of gradation, marked according to their attainments in education, their compliance with the rules of the institution, etc.; the ordinary convict-dress is not used, and the discipline is more humane than has been the rule elsewhere. While some object strenuously to being "educated," from 38 to 40 per cent. accept the conditions readily, and the results, in the way of reformation and elevation, have been most gratifying. The abolition of contract-labor in prisons was favored by a large popular vote in 1883, and though the system is practically abolished, no final legislative action has yet been taken.

TABLE OF EDUCATIONAL STATISTICS.

A summary of statistical reports for year ending Sept. 30, 1877.

	Cities.	Towns.	State.
Number of districts	.....	11,287	11,287
Number of teachers employed at the same time for 28 weeks or more	5,890	13,848	19,738
Number of children between 5 and 21 years of age	744,911	841,323	1,586,234
Number of male teachers employed	634	7,216	7,850
Number of female teachers employed	6,044	16,267	22,311
Number of children attending the common schools	407,343	616,372	1 023,715
Average daily attendance	244,236	315,301	559,537
Number of visitations by school commissioners	.....	19,226	19,226
Number of volumes in district libraries	147,051	618,495	765,546
Number of log school-houses	.....	87	87
Number of frame school-houses	60	9,971	10,031
Number of brick school-houses	368	912	1,280
Number of stone school-houses	10	425	435
Whole number of school-houses	438	11,395	11,833

In 1883 there were 11,257 school districts; 1,041,089 children enrolled; 21,122 teachers employed during legal term of school; estimated value school-houses and sites, $31,011,211; receipts in 1882, $11,384,078; expenses, $11,422,593. These statistics include, of course, New York city. Women may hold school offices and vote in school meetings. All cities, and union and free school districts under special acts must give free instruction in industrial drawing, as must all state normal schools, of which there are 8. There is a normal college in New York city. Connected with the state univer-

sity in 1882, were 22 institutions for higher education; 17 for young men, and 5 for young women. The annual expenditure for public schools is nearly $4,000,000.

There were, Sept. 30, 1884, 318 national banks, including 44 in N. Y. city, with capital of $83,273,360, and individual deposits amounting to $288,020,248. There were in 1882, 88 state banks and trust companies, with capital of $21,246,578; 675 private banks, mostly in N. Y. city, with capital of $53,592,464; 119 savings banks, with deposits amounting to $397,032,216. There were in 1883, 16 safe-deposit companies, with capital of $2,886,900. For statistics of joint-stock fire, mutual fire, marine, life, and casualty insurance companies, see INSURANCE. The number of co-operative insurance companies in 1883 was about 130, of which two-thirds belonged to the state.

The subject of the preservation of the forests, particularly those of the Adirondack region, has been much discussed of late years, as the reckless cutting by lumber-men, and the annual fires, kindled by accident or design, have, in destroying the trees, dried up the sources of many streams, and seriously threatened even the Hudson itself, and its commerce. A forrestry bill passed the Assembly in 1885, providing for commissioners, and under them, a forest warden, with assistants and inspectors. These are to have general charge of forests and tree-planting, and particularly, the care of the 15 Adirondack counties, with power to prevent and punish the destruction of timber. In 1884, the civil-service act became applicable to every incorporated city

NEW YORK, the most important city and sea-port of the United States, and the third in the civilized world, is situated on the east side of the mouth of the Hudson river, at its confluence with a narrow strait called East river, which opens into Long Island sound, in the state of New York, 18 m. from the ocean. Lat. 40° 42′ 43″ n., long. 74 0′ 3″ west. The city comprises the island of Manhattan, formed by the Hudson river and the East river, and separated from the main-land by a narrow strait called Harlem river, on the e., and on the w. by Spuyten Duyvel creek; includes several smaller islands, containing the fortifications in the harbor, and the public institutions in the East river; and also part of the main-land n. of Manhattan island. The island on which the city is built is 13½ m. long, and with an average breadth of 1⅘ of a mile, comprising 22 sq. miles. A rocky ridge runs through the center, rising at Washington heights, 238 feet. The compactly built city extends five m. from the "battery" at its southern point, and is laid out regularly into 141,486 lots. Avenues 100 feet wide and 8 miles long, in straight lines, are crossed at right angles by streets from 60 to 100 feet wide, extending from river to river. The city is connected with the main-land of New York by bridges across the Harlem river, with Long island by a fine suspension bridge, and with New Jersey, Long island, and Staten island by numerous steam-ferries. Several railways radiate from the city, while the finest passenger steamboats in the world pass up the Hudson, Long Island sound, and down the Narrows, through the lower bay. The harbor, formed by the upper and smaller bay, with its two arms, which almost inclose the city, is one of the finest in the world. There are 80 piers for shipping on the west, and 70 on the east side of the city. The harbor is defended by fourteen forts, mounting 1500 guns. The streets are traversed by many city omnibuses and tramways, which carry millions of passengers annually.

The city is built of brick, brown sandstone, and white marble. Among its finest edifices are the city hall, custom-house, Trinity church, Grace church, two universities, cathedral, academy of music, Cooper institute, and the numerous great hotels, several of which have accommodation for more than a thousand persons. Of 331 churches, 72 are Protestant Episcopal, 41 Roman Catholic, and the others of all denominations. In 1873 there were 223 public schools and 17 corporate schools with 236,543 pupils, and the college of the city of New York, formerly the free academy. Besides, there are 35 Roman Catholic schools, and colleges and academies of the religious orders. Columbia college is one of the oldest in the country; the university of the city of New York has been more recently established. Each has departments of law and medicine, and there are two other medical colleges, several theological seminaries, and many private academies. The hospitals and institutions of charity are on a liberal scale; and besides legal outdoor relief, the poor are visited and cared for by a public society, with agents in every district. Among the charities are asylums for insane, blind, deaf and dumb, magdalens, foundlings, etc. The Astor free library, founded by John Jacob Astor, has 150,000 carefully selected volumes; the mercantile library, 150,000 volumes, with a large reading-room; society library, 64,000; apprentices' library, 50,000, with rich museums of antiquities; the Cooper institute, a present to the city by Peter Cooper, has a free reading-room, picture-gallery, art-schools, etc. Annual art exhibitions are given by the national academy of design, Metropolitan museum and other galleries. The academy of music, or opera-house, has seats for 4,700 persons, and eight or ten theaters give nightly entertainment to 20,000. The Central park, laid out in the finest style of landscape-gardening, is two and a half miles long by three-fifths of a mile wide. Eighteen smaller public parks are scattered over the city. The Croton aqueduct brings a river of pure soft water from 40 miles distance, which is received in reservoirs of a capacity of 1,500,000,000 gallons, and distributed through 370 miles of pipes, with such a head as to sup-

* Estimated.

ply public fountains of 60 and 80 feet jet, and the upper stories of most buildings. Eleven markets supply annually 140,000,000 lbs. beef, 25,000,000 lbs. mutton, 56,000,000 lbs. pork, and immense quantities of poultry, game, fish, oysters, fruits, and vegetables. The city government is composed of a mayor, boards of aldermen and councilmen, and bureaux of various departments. The police numbers about 2,500, with salaries of $800 to $5,500 a year. The stations are connected by telegraph. and have lodgings for destitute persons. A sanitary squad has charge of the public health. The commissioners of charity and correction have direction of asylums, hospitals, and prisons. Commissioners of emigration receive and attend to the wants of immigrants. The volunteer brigade of firemen has been replaced by a paid fire department, which is found to be much more effective for the protection of property. It consists of upwards of 700 men, with above 40 steam fire-engines, and a large number of telegraph stations. New York is the great center of American finance and commerce. It receives 66 per cent of all imports, and sends out 50 per cent of all exports. The total value of imports in 1873–74 was $395,133,622; of exports, $354,993,732. Vessels entered, 6,723, of 5,049,618 tons; cleared, 6,103, of 4,837,218 tons. The total number of vessels belonging to the port of New York was 6,630, of 1,318,523 tons. There were, in 1870, 7,624 manufacturing establishments, employing 129,577 hands, the cost for wages being $63,884,049, and the value of products $332,951,520. The assessed value of real and personal estate in 1875 was $1,154,029,176. The number of immigrants that arrived in New York during the year ending June 30, 1874, was 260,814.

New York, the Nieu Amsterdam of the Dutch, was founded in 1621; in 1664 it was taken by the English. At the period of the revolution it was smaller than Philadelphia or Boston; but increased in importance, especially after the completion of the Erie canal had opened to it the commerce of the west. In 1789, 2,086 persons died of yellow fever; in 1832, 3,513 of cholera; in 1845 a fire destroyed a large portion of the business part of the city, with a loss of $18,000,000. In 1741, in consequence of a supposed negro plot to burn the city, 13 negroes were burned at the stake, 20 hanged, and 78 transported. In 1863, in a riot caused by the conscription, the popular fury again turned against the negroes, and numbers were murdered.

NEW YORK, co. N.Y. (See NEW YORK, city.)

NEW YORK (*ante*). The city of New York, which formerly comprised only Manhattan and other islands, was extended by legislative act, taking effect Jan. 1, 1874, to include the following villages of Westchester co., on the main-land: Morrisania, West Farms, Kingsbridge, Mott Haven, North New York, Port Morris, Melrose, Woodstock, Highbridgeville, Claremont, Tremont, Mount Hope, Mount Eden, Fairmount, Belmont, Fordham, Williamsbridge, Spuyten Duyvel, Mosholu, Riverdale, and Mount St. Vincent. Its present boundaries are Yonkers on the n., the Bronx river and the East river on the e., the bay on the s., and on the w. the Hudson or North river. It extends 16 m. n. from the Battery, is 4½ m. wide at its widest part, and has a total area of 41½ sq.m., or 26,500 acres.—That part of the city comprised by Manhattan island is connected with the main-land by, 1, an iron drawbridge from 3d avenue, called Harlem bridge; 2, the railroad bridge at 4th avenue of the New York Central and Hudson River railroad, and the New York and Harlem and the New York and New Haven railroads; 3, Central, formerly McComb's Dam, bridge; 4, King's bridge, at the point of meeting of Harlem river and Spuyten Duyvel creek; 5, High bridge. The latter is the way by which the Croton aqueduct crosses the Harlem river at 175th street. It is 1460 ft. in length and 116 ft. high at its highest elevation above the surface of the river. The water crosses it in great pipes made of cast-iron, and built into brick masonry. At the lower end of High bridge is an engine-house and a tower for high-water service. New York is connected with Brooklyn and other places on Long Island by numerous ferries, over which it is estimated that 75,000,000 persons cross annually. To relieve the ferry traffic the East river suspension bridge was undertaken by a company formed in 1869 with a capital of $500,000; to which the legislature of the state permitted the city of New York to add $3,000,000, and the city of Brooklyn $1,500,000—in all a capital of $5,000,000; see BRIDGE. Between New York and Jersey City, on the w. bank of the Hudson, a comprehensive ferry system is sustained, which is to be relieved by the tunnel under the Hudson river, now being constructed; see TUNNEL. New York is also connected with Hoboken, N. J., and with various points on Staten Island by lines of ferry-boats.—*Piers.* There are 136 piers or wharves, of which number 66 are on the Hudson and 70 on the East river. From the piers on the North river steamers sail coastwise to the West Indies, to Great Britain and the continent of Europe, and to Boston, Halifax, N. S., Albany and other points on the Hudson river, and New Orleans. From the East river side steamers sail coastwise to English and Scotch ports, to Philadelphia, to points on Long Island, and to Portland, Me., New Bedford, Mass., and points on the sound, Connecticut river, and Narragansett bay. On this side, also, are the balance, sectional, and screw dry docks, and the New York city dumping-grounds. At the piers on both sides, also, is accommodated the enormous sailing commerce of the metropolis.—*Railroads.* Three railroad lines terminate within the city limits: the New York Central and Hudson River, the New York and Harlem, and the New York, New Haven and Hartford, all at the Grand Central depot in 42d street, the latter having also a freight depot on Center street, and the New

York Central and Hudson River a depot for local trains at 30th street and 10th avenue, and a freight depot at the former site of St. John's park. All other railroad lines terminate in Jersey City and Hoboken, N. J., excepting the New Jersey Southern, which has its depot at Sandy Hook, connecting with the city by steamboat, and the Long Island railroads, which terminate at Hunter's Point, L. I., connecting with the city by ferry.—*Streets.* There are 378 named streets, places, courts, avenues, and boulevards, 168 numbered streets, 13 numbered avenues, and 5 avenues designated respectively A, B, C, D, and E. The numbered cross-streets are designated e. and w. from 5th avenue, each avenue beginning a new hundred numbers.—*Churches.* There are 386 churches, synagogues, chapels, and meeting-houses, of which 7 are colored Methodist Episcopal, 3 Friends' meeting-houses, 26 Jewish synagogues, 23 Lutheran, 52 Methodist Episcopal, 42 Presbyterian, 72 Protestant Episcopal, 21 Reformed Dutch, 55 Roman Catholic, 3 Unitarian, 6 United Presbyterian, 4 Universalist, 39 Baptist, 8 Congregational, 5 Reformed Presbyterian, miscellaneous, 24.—*Libraries.* The public libraries include the Apprentices', Astor, Bar Association, City, Cooper Union, American Institute, Mercantile, Harlem, Historical Society, Law Institute, Lenox, Mott Memorial, New York free circulating, Society, Printers', Woman's, and Young Men's Christian Association ; see LIBRARIES.—*Theaters.* The Academy of Music, Bijou opera house, Casino, Comedy Theatre, Daly's, Fifth Avenue, Fourteenth street, Germania, Globe, Grand Opera House, Harry Miner's, London, Madison square, Metropolitan Opera House, Mt. Morris, National, Niblo's Garden, Park, People's, Stadt theater, Standard, Thalia, Tony Pastor's, Union square, Wallack's. There are also numerous skating rinks, museums and concert rooms.—*Clubs.* Army and Navy, Century, Down-Town, Harmonic, Knickerbocker, Lotos, Manhattan, Merchants', New York, Press, Racquet, St. Nicholas, Union, Union League, and University.—*Parks.* Besides the Central park there are the Riverside, Battery, City hall, Gramercy, Morningside, Madison, Stuyvesant, Jackson, Abingdon, Union, Reservoir, Washington, Mount Morris, and Tompkins squares, and Bowling Green. Central park was begun in 1858, that portion of the city being included which lies between 59th and 110th streets and between 5th and 8th avenues, and containing 849 acres, of which about one-half is woodland, the remainder being laid out in lawns, driving and bridle roads, gardens, pasture, play ground, etc.; there are two extensive lakes, with rustic bridges, used for boating in summer and skating in winter, covering 25 acres, and four smaller sheets of water, comprising in all as much more.—*Metropolitan Museum of Art.* This institution was founded in 1870, "for the purpose of establishing a museum and library of art, of encouraging and developing the study of the fine arts, of the application of art to manufactures and to practical life, of advancing the general knowledge of kindred subjects, and, to that end, of furnishing popular instruction and recreation." The number of members of the corporation is limited to 250 ; the trustees, 21 in number, holding office for 7 years, the terms of office of 3 of the number expiring every year. The museum was at first in a building in 5th avenue, between 53d and 54th streets ; afterwards removed to the Douglass mansion in 14th street, where it remained until 1879–80, when it was permanently placed in the building erected for it by the park department in the Central park, at a cost of $500,000. This building was opened Mar. 30, 1880, by the president of the United States. It is situated in Central park, at 5th avenue and 82d street; is built in modern Gothic style, of red brick, with sandstone trimmings; is 218 ft. long and 95 broad, facing to the east. It contains the Blodgett collection of Flemish, Dutch, and other paintings, the unique Cesnola collection of Cypriote archæological objects, the Avery collection of pottery, and numerous other articles of great beauty and interest. The museum is opened free of charge to the public on Wednesdays, Thursdays, Fridays, and Saturdays; on Mondays and Tuesdays the charge for admission is fifty cents.—The area of the other parks is as follows: Bowling Green, 0.517 acre; Battery, 21.199; City hall, 8.234; Washington square, 8.115; Cooper Union, 0.224; Tompkins square, 10.508; Union square, 3.483; Madison square, 6.492; Reservoir square, 4.775; Mount Morris, 20.173; Morningside, 31.258; Stuyvesant square, 4.229; Abingdon square, 0.202.—*Museum of Natural History.* Incorporated by the state legislature in 1869; opened to the public in its present building, Central park, 81st street and 8th avenue, on Dec. 22, 1877. It is built of red brick, with yellow sandstone trimmings, in the modern Gothic style. The collection comprises mounted specimens of mammalia and birds; archæological specimens, including the De Morgan collection of stone implements; the Squier and Davis Mississippi valley collection; geological specimens of New York state; building stones, marbles, woods, wax fruits, etc.; admission free.—The art galleries comprise those of the academy of design (where exhibitions are made); the Metropolitan museum and Lenox library; the American art gallery (Kurtz's) in 23d street; galleries of Knoedler, Avery, Schaus, Cottier, Reichard,and Kohn, dealers in paintings, and the private galleries of leading citizens, which can generally be inspected on proper introduction.—*Banks.* There are in New York 47 national banks, 25 state banks, 25 savings banks.—There are 45 hospitals and 34 dispensaries and infirmaries. The number of benevolent societies and other similar institutions is 195, public and private.

Education.—The New York public school system is under the general control and direction of the board of education, supplemented by trustees and school inspectors. The board is composed of 24 members, appointed by the mayor, who are called commissioners, and who appoint 5 trustees in each ward, the mayor appointing 3 inspectors in

each school district; the rooms of the board of education are at 146 Grand street. The whole number of public schools is 298, the attendance being about 300,000 children, taught by 3,696 teachers, at an annual expense of $3,800,000. The classification of all the schools in the city is as follows:

College of the city of New York	1
Normal school and training school	2
Grammar schools for males	46
" " " females	46
" " " both sexes	11
Primary departments of grammar schools	68
Primary schools (separate)	45
Colored schools	3
Corporate schools (industrial, reformatories, orphan asylums, etc.)	48
Evening schools, including evening high school	27
Nautical school (ship St. Mary's)	1
Total	298

The evening schools supply instruction to about 20,000 children and others who are obliged to work during the day. The salaries paid to teachers vary between $600 and $3,000 per annum. The college of the city of New York was established in 1847, and until 1866 was known as the New York free academy. The members of the board of education are *ex officio* trustees of the institution. It is open only to pupils from the public schools who have been in attendance at least one year. The faculty comprises a president, 13 professors, and 16 tutors. The students in the introductory classes number about 800, and those in the college classes about 450 each year. The college confers the degrees of B.A., M.A., B.S., and M.S. The buildings are on Lexington avenue and 23d street, massively built of brick, and valued at $190,000; they contain a library, natural history cabinet, and scientific apparatus, the whole valued at $80,000. The annual cost of maintaining the college is about $150,000. The normal college for women is on 69th street, between Lexington and 4th avenues. The building is 300 ft. long and 125 ft. wide, fronting on 4th avenue. It contains 30 recitation rooms, 3 large lecture rooms, a library, calisthenium, retiring rooms for instructors, president's offices, and a main hall to seat 1600 persons; its cost was $484,000. There is also a model or training school for practice. The main building is very striking, built in the secular Gothic style, with high tower. This college is under the control of the board of education, being a part of the public school system; its object is to prepare teachers for the common schools. About 1600 pupils are usually on the roll, the curriculum including Latin, physics and chemistry, German, natural science, French, drawing, and music. The cost of maintaining this institution is about $100,000 per annum. Other institutions of learning in the city are Columbia college, the university of the city of New York, and the medical, law, and theological schools and seminaries. Columbia college, originally King's college, was chartered in 1754, and at first supported from funds raised in England for the purpose. The corporation of Trinity church erected the first college building on the church lands between College place and the Hudson river. It was finally incorporated under its present name in 1784, but the charter was amended three years later, vesting the management of the college in a self-perpetuating body of 24 trustees, under which direction it still remains. About 1850 the old buildings were surrendered, and the college removed to its present site on Madison and 4th avenues, 49th and 50th streets. The college is under the control of a president and about 60 professors; the students reside at their homes. The departments are the academic, the school of mines, and the law school, the latter occupying rooms in the library building which was erected in 1884. The university of the city of New York is comprised in the university building on Washington square, and the medical college building on E. 26th street, opposite Bellevue hospital. The university was chartered in 1830, and is non-denominational. The building is a handsome Gothic structure of white freestone. The income is about $40,000 annually. Instruction in the departments of the arts and sciences is given free of charge, the course being 4 years; that of law is 2 years. The average number of students is 500. Examinations are held each year on the Tuesday preceding the commencement in June, and that preceding the opening of the first term in September, in the departments of arts and sciences. No examination is required for the other departments, their year beginning on the first Monday in October. The regular medical schools or colleges are Bellevue hospital medical college, the College of physicians and surgeons, and the University medical college, the second of these being the medical department of Columbia college. Bellevue hospital medical college is situated within the hospital grounds, at the foot of E. 26th street. It was founded in 1861, is independent of the city colleges, and is under the control of the commissioners of public charities and corrections, who are *ex officio* members of the board of trustees. The applicant for admission must be 18 years of age, but there are no other requirements. Graduation takes place after 3 years' study of medicine under a regular physician in good standing,

attendance on two full courses of medical lectures (the last being in the college), attendance on one course of instruction in practical anatomy or dissections, proper testimonials of character, a written thesis, and examination in the practice of medicine, surgery, obstetrics, materia medica, physiology, anatomy, and chemistry. The fees in all amount to $185. The number of students is about 500, and the college ranks high in general estimation. The Protestant Episcopal theological seminary is situated in what is known as Chelsea square, between 9th and 10th avenues and 20th and 21st streets. It was founded in 1819 and chartered in 1822. The governing body comprises "all the bishops of the church, *ex officio;* 1 trustee from each diocese, and 1 additional for every 8 clergymen in the same; 1 more additional for every $2,000 of money contributed, until the same amounts to $10,000, and then 1 more additional for every $10,000." The faculty consists of a dean and staff of professors, and the course of study lasts 3 years. The Union theological seminary is in Park ave. between 69th and 70th streets. It was founded in 1836, and in 1884 was removed from University place to its present site. It is governed by a board of trustees, consisting of 28 members of the Presbyterian church, one-half clergymen and one-half laymen. The seminary course occupies 3 years. The library has 50,000 volumes, and as many pamphlets, and is very valuable.

Fire Department.—This department consists of 3 commissioners, appointed by the mayor, and confirmed by the board of aldermen, and holding office for 6 years. The president of the board receives a salary of $7,500, and the others $5,000 each. The machinery of the department includes 72 steam fire-engines, 4 self-propelling steam fire-engines, 2 marine or floating engines, and 31 hook and ladder trucks ; there are 12 fuel depots, 7 bell-towers and lookouts, and repair-shops, hospital, stables, etc. The department comprises 1071 men, of whom about 800 perform active service. About 700 fire-alarm boxes are scattered over the city. The expense of the department is about $1,500,000 annually. The relief and life insurance fund of the department had on hand at the close of 1880 the sum of $450,072.88 ; the receipts during the year were $54,696.44 ; the disbursements, $27,192.63. Following is a table of fire statistics for 15 years :

Year.	No. of Fires.	Aggregate Loss.	Average Loss.	No. of Companies.	No. of Men.
1866	796	$6,428,000	$8,075.38	54	964
1867	873	5,711,000	6,541.81	54	919
1868	740	4,342,000	5,867.51	52	592
1869	850	2,696,393	3,172.23	52	599
1870	964	2,120,212	2,199.39	52	596
1871	1,258	2,127,356	1,691.06	52	596
1872	1,649	2,891,818	1,753.67	52	596
1873	1,470	4,022,640	2,736.48	54	651
1874	1,355	1,430,306	1,055.58	64	712
1875	1,418	2,472,536	1,743.67	67	748
1876	1,382	3,851,213	2,786.70	68	747
1877	1,450	3,210,695	2,214.27	65	752
1878	1,654	1,884,505	1,139.36	65	727
1879	1,551	5,671,580	3,656.72	64	729
1880	1,783	3,183,440	1,785.44	65	749
Total	19,193	$52,043,694	$2,711.59		

The health department is under the direction of a board of health, which has charge of all sanitary matters pertaining to the city government (excepting street cleaning), and which records the births, marriages, and deaths within the city limits quarterly. During the quarter ending Dec. 31, 1880, the number of persons registered as married was 5,218, and the number of children born was 7,017.

The population of the city by the U. S. census of 1880 was 1,206,577. During the year 1880 the number of deaths was 31,937, an increase of 3,595 on the previous year; the number of deaths, in proportion to population, was 26.47 in every 1000; 26.37 for the white population, and 33.87 for the colored. The annual death-rate per 1000 for previous years was: 1879, 25.82; 1878, 24.93; 1877, 24.50; 1876, 27.62; 1875, 29.47; 1874, 28.94; 1873, 29.68; 1872, 33.96; 1871, 28.26. Following is the table of diseases causing death for 1880, showing the comparative mortality according to sexes:

Diseases.	Females.	Males.	Total.
Phthisis pulmonalis	2,260	2,446	4,706
Pneumonia	1,270	1,522	2,792
Bronchitis	671	704	1,375
Diarrheal diseases	1,853	2,094	3,947
Bright's disease and nephritis	486	539	1,025
Heart disease	572	581	1,153
Cancer	441	218	659
Intemperance			302
Inanition, mostly children			307
Small-pox	12	19	31
Measles	223	256	479

Diseases.	Females.	Males.	Total.
Scarlatina	295	323	618
Yellow fever	...	1	1
Diphtheria	717	673	1,390
Whooping cough	143	134	277
Typhus fever	1	1	2
Typhoid fever	106	135	241
Croup	429	481	910
Cerebro-spinal fever	71	99	170
Malarial fever	236	234	470
Remittent fever	85	65	150
Intermittent fever	80	85	165
Typho-malarial fever	64	67	131
Erysipelas	83	88	171
Chagres fever	..	1	1
Puerperal fever			49
Cirrhosis of liver and hepatitis	153	158	311
Gastritis, enteritis, peritonitis	382	379	761
Cyanosis and atelectasis	70	130	200
Premature and preternatural	327	389	716
Apoplexy	228	288	516
Infantile convulsions	346	385	731
Meningitis	234	349	583
Encephalitis	28	29	57
Sunstroke	38	78	116
Rheumatism	100	72	172
Gout	4	7	11
Accidents and negligence	288	819	1,107
Drowning	34	204	238
Homicide	17	41	58
Hydrocephalus and meningitis	279	338	617
Marasmus, scrofula, etc	344	376	720

The number of deaths from suicide in 1880 was 152, of which 121 were male and 31 female; 34 single, 74 married. Nativity: United States, 35; Germany, 64; Ireland, 20; Switzerland, 3; France, 7; Poland, 3; Scotland, 3; Italy, 3; England, 5. The deaths of children under five years of age were 14,650, or nearly one-half the entire mortality, the number being almost equally divided between males and females.

The total number of deaths in 1883 was 33,982, and the annual death rate per 1,000 was 25.81. Of these the number of deaths in houses containing 3 families or less was 7,770, while in houses containing 4 families and over there were 18,359 deaths, or more than double the number. The number of deaths in institutions in the same year was 6,955, and it is probable that over a third of these were non-residents, induced to visit the city for treatment; these ought not to be credited to New York. The number of births in 1883 was 28,972, and marriages, 11,556.

Commerce and Manufactures.—Between 50 and 60 per cent. of all the foreign trade of the U. S. passes through the port of N. Y. During the fiscal year ending June 30, 1883, its imports amounted to $508,700,476, out of a total for the whole country of $751,670,-305, its exports were $383,638,512 out of a total of $855,659,735. For the last 50 years or more the city has been the principal distributing agency of foreign goods, especially dry goods. It is also the leading city of the union in its manufactures. In this respect its growth since the census of 1860 may be seen from the following table:

	Census of 1860	Census of 1870.	Census of 1880.
No. of establishments	$4,375	$7,624	$11,339
Capital	61,212,757	129,952,262	181,206,356
Value raw material	90,177,038	178,696,939	285,441,691
No. of hands	90,204	129,577	227,352
Wages paid	28,481,915	63,824,049	97,030,021
Value of products	159,107,369	332,951,520	472,926,437

In 1880, the industries occupying the largest number of establishments were as follows: boots and shoes, 839; bakery products, 782; cigars, 761; men's clothing, 736; carpentering, 460; printing and publishing, 412; plumbing and gas-fitting, 401; furniture, 299. In the value of products the leading industries were, men's clothing, $60,-798,697; meat packing, $29,297,527; printing and publishing, $21,696,354; malt liquors, $19,137,882; women's clothing, $18,950,553; cigars, $18,347,108. The whole number of industries enumerated in the census table is 164.

The building department supervises the erection of new buildings and additions to old structures within the city limits. The superintendent of buildings is nominated by the mayor, and confirmed by the board of aldermen for a term of 6 years; salary $6,000. At the beginning of 1884 there were in the city 101,735 buildings; sheds, 4,216; bridges, 144, piers, 306; making a total of all structures of 106,401. Of the entire number 70,835 are below 59th street; 77,235 buildings were used wholly or partly for dwelling purposes; 24,500 were used exclusively for business and other than dwelling purposes; 72,370 dwell-

ings and 21,114 business buildings were 5 stories high or less, 4,865 dwellings, and 3,386 business buildings were more than 5 stories high. Of the dwellings, 30,498 had one family each; 9,878 more than one each; 16,950 had one family to a floor; and 19,909 more than one on each floor.

Cemeteries.—Intra-mural interment, except in certain specified instances, being prohibited by law in New York, the city's dead are buried in the following cemeteries: Calvary, Cypress Hills, Evergreens, Greenwood, Lutheran, Machpelah, Maple Grove, Marble, New York Bay, Trinity, Union, Washington, and Woodlawn. The last-named is at Woodlawn station, on the Harlem railroad, in the 24th ward; Trinity is at 153d street and 10th avenue; Marble is in 2d street: these three are exempted from the law regarding city burial. Of the remainder, Machpelah and New York Bay are in New Jersey, and the others on Long Island. The United States Cremation company (limited), which was licensed in 1875, with a capital stock of $50,000, proposes to build a crematory in or near New York. This company has done much to turn public opinion in favor of cremation as a means of disposal of the dead.

City Railroads.—The surface (horse) railroads include the Broadway and University place, to Central park; Broadway and Broome street, to Broadway and Barclay street; Bleecker street, from Fulton ferry to 23d street ferry; Belt line, from South ferry around the city by 59th street, and return; City hall, Avenue B, and 34th street; Dry Dock and East Broadway to 23d street ferry (east side); Eighth avenue, from Broadway and Vesey street to Central park; First and Second avenue, Peck slip to 138th street; Fourth avenue and Madison avenue, City hall to 86th street; Ninth avenue, Broadway and Fulton street to 55th street; Seventh avenue, Broadway and Park place to Central park; Sixth avenue, Broadway and Vesey street to Central park; Third avenue, Astor House to Harlem; and 11 cross-town lines. The Broadway line, after much opposition, was completed 1885, and a continuous track now runs along that thoroughfare from the Battery to Central Park. An arcade (underground) steam railway is proposed to connect the two ends of the city, and to afford swifter passage than is now possible on the elevated railroads.—*Elevated Railroads.* These are all in the hands of one company, the N. Y. Elevated Railroad Company, and include the Ninth avenue line, from South ferry to 59th street; Second avenue, from South ferry to Harlem; Sixth avenue, from Rector street to Harlem river; Third avenue, from City Hall to Harlem river.—A tunnel under the Hudson river, between New York and Jersey City, is in course of erection. It is thus proposed to extend the railways now terminating in the latter place to New York, and to afford easier access between the two cities.—New York is lighted by gas supplied by 8 companies. The number of street lamps is about 25,000, the average annual cost per lamp, about $17. The works of the gas companies cover about 100 acres; over 900 miles of main pipes run through the streets. A requirement (which is seldom enforced) is laid on the companies to furnish a gas which when burning at ordinary pressure will produce a light equaling that of 16 sperm candles. Electric lights have supplanted gas on the principal streets and in many public buildings. The number of hotels is 150; of apartment houses, over 300.—The number of the police force, including surgeons, is nearly 3,000.—*The police department* is governed by a board of four commissioners, appointed by the mayor with the concurrence of the board of aldermen; removable (for cause) by the mayor, with the concurrence of the governor of the state. They receive an annual salary of $5,000 each, excepting the person whom they choose to be president of the board, who receives $8,000. The commissioners appoint all the members of the force, including 1 superintendent and 4 inspectors, and make all promotions and dismissals after trial. The city is divided into 34 precincts; each of which has a suitable building, and is under the command of a captain, assisted by a sufficient number of sergeants and roundsmen. Patrolmen receive $1000 per year salary; roundsmen, $1200; sergeants, $1500; and captains, $2,000.—*The public markets*, under the general direction of a superintendent, are the following: Catharine, foot of Catharine street, East river; Central, E. 42d street, opposite Park avenue; Centre, Centre street, from Grand to Broome; Essex, Grand street, from Ludlow to Essex; Fulton, Fulton, Beekman, South, and Front streets; Fulton fish, South street, opposite Fulton market; Jefferson, Greenwich and 6th avenues, and W. 10th street; Tompkins, 3d avenue, between 6th and 7th streets; Union, Houston and 2d streets and Avenue D; Washington, Washington, West, Vesey, and Fulton streets; Market-wagon stand, West, Little 12th, Washington, and Gansevoort streets, for farmers' wagons, and buyers of produce.—*Militia.* The first division, national guard, state of New York, comprises the city militia organization, including 8 regiments of infantry, one regiment and a separate troop of cavalry, and 2 batteries of artillery, a complement of 5,230 men, thoroughly drilled and equipped. The division headquarters is at 155 Mercer street; and the ordnance department and quartermaster-general's department of the state in the arsenal, cor. 7th ave. and 35th st.—*Newspapers.* The number of morning papers published in the city is 27; there are 11 evening papers, 11 semi-weekly, 195 weekly, 11 bi-weekly, 12 semi-monthly, 185 monthly, 2 bi-monthly, 14 quarterly. Every trade has its representative "organ;" and most of the denominations have more than one newspaper.—*Post-office.* Besides the general post-office in City hall park, there are 19 sub-stations in different parts

of the city, and 1000 lamp-post boxes, from which collections are made 7 times daily, except Sundays. Eleven of the sub-stations are designated by the letters of the alphabet, and the remainder by the names of the suburban villages in which they are situated.—*Prisons.* Each police-court has connected with it a prison, viz.: the Tombs, or city prison, in Centre street; Essex Market, in Essex street, between Grand and Broome; Jefferson Market, 6th avenue and W. 10th street; Yorkville, 57th street, between 3d and Lexington avenues; Harlem, 125th street, between 3d and Lexington avenues; and Fordham. Ludlow street jail is used for prisoners from the federal and state courts.

The Stock Exchange is a fine white marble building in Broad street, near Wall, extending back to New street, and having an extension to Wall street. Seats in the exchange are now worth $25,000; only members are allowed on the floor. The heirs of every deceased member receive $10,000, without deduction, from the gratuity fund established by the exchange. There are 1060 members: about 300,000 shares of stock are bought and sold daily, and the amount of the business of each day is about $1,500,000, of which one-third is government bonds.—Among the important buildings deserving notice is St. Patrick's (Roman Catholic) cathedral, occupying the block on 5th avenue between 50th and 51st streets. The building was projected by archbishop Hughes about 1850, and the plans drawn by James Renwick: the corner-stone was laid Aug. 15, 1858, and it was dedicated by cardinal McCloskey, May 25, 1879. The architecture is of the 13th century style, the ground plan being in the form of a Latin cross. The dimensions are: interior length, 306 ft.; breadth of nave and choir, 96 ft., with the chapels, 120 ft.; length of transept, 140 ft.; height, 108 ft.; height of side-aisles, 54 feet. The 5th avenue front comprises a central gable 156 ft. in height, with towers and spires, each to be when finished 330 ft. high. The building is of white marble, with a base-course of granite. The roof is supported in the interior by white marble columns 35 ft. high and 5 ft. in diameter; the ceiling is groined and richly ornamented; the organ-loft is 46 ft. wide and 28 ft. long, of ash, richly molded; the high altar is 40 ft. in height. Total cost about $2,500,000.—The building of the Young Men's Christian association, 4th avenue and 23d street, was erected in 1869, and cost $500,000. It is French renaissance in style, 5 stories high, 175 ft. front and 86 ft. depth. The association was organized in 1852, and furnishes a reading-rooom, lectures, concerts, and evening classes in languages and other branches to its members; subscription, $5 per annum.—Castle Garden, originally a fort, and later and for many years a place of amusement, is now used as a depot for emigrants, for which purpose it has been employed since 1855. It is situated in the Battery park, at the extreme southern end of Manhattan island, convenient for foreign steamers and shipping. It contains at times as many as 1000 immigrants. The business of receiving, caring for, and shipping to their destination the many thousands of immigrants is in charge of 9 commissioners of emigration, 6 of whom are appointed by the governor of the state, the other three being the mayor of the city and the presidents of Irish and German emigrant societies, *ex officio*, who have entire control of the emigrants arriving at this port. During the year ending Dec. 31, 1880, 372,880 persons arrived at this port, of whom 320,607 passed through Castle Garden. Their destinations were: eastern states, 63,368; western states, 112,119; southern states, 6,497; New York state, 137,561; Canada, 1,627. See LABOR BUREAU: IMMIGRATION, in *Supp.*

Law Courts.—The first court of law was established in 1626; and this Dutch court was continued in New York until 1665, when it was abolished by the English governor, and superseded by one composed of the mayor, aldermen, and sheriff, and known as the mayor's court; and this continued in existence until 1821, when it was changed to the court of common pleas. The superior court was created in 1828, with a chief-justice and two associates. The assembly which convened in 1691 created the courts of justices of the peace, and the court of general sessions; also the present supreme court, the court of oyer and terminer being the criminal circuit of the latter. The constitution of 1846 created the present court of appeals. The courts now in existence are: the U. S. circuit court, the U. S. district court, the supreme court, court of common pleas, superior court, court of arbitration (established in 1875), the district courts (of which there are ten), oyer and terminer, special sessions, and six police courts. The law department of the city government is in charge of the corporation counsel, who is appointed by the mayor, confirmed by the board of aldermen, and receives a salary of $15,000 per annum. Under him are the corporation attorney, salary $6,000; and the public administrator, $5,000.

Government.—Under the charter passed April 30, 1873, the government of the city is vested in the "mayor, aldermen, and commonalty of the city of New York." The legislative power is vested in a board of 22 aldermen, holding office for a term of one year from Jan. 1, after election at the general election in November. The executive power is vested in the mayor and heads of departments appointed by the mayor, and confirmed by the board of aldermen, for a term of six years (except in special cases). The mayor is elected at the November general election for a term of two years. The departments are those of finance, law, police, public works, parks, docks, charities and corrections, fire, health, taxes and assessments, and buildings. The salary of the mayor is $12,000, and that of each alderman $4,000 per annum. The finance department is under the direction of the comptroller, who receives a salary of $10,000 per annum. The city chamberlain receives a salary of $30,000, out of which he pays all the expenses of his office. This department has control of all the fiscal concerns of the

corporation. The total cash payments from the city treasury during the year ending Dec. 31, 1884, amounted to $32,046,165; the appropriations for 1885 were $31,871,905. The estimated receipts from taxes for '85 were $32,372,000; the assessed value of real and personal estate in the city for 1885 was estimated at $1,378,208,343; assessed value, '84, $40,000,000. The total bonded debt of the city outstanding, Dec. 31, 1884, was $92,047,403. The assessed value of the personal property of corporations was $49,316,580. The assessments upon the shareholders of banks since 1873 have been as follows:

1873	$77,650,395
1874	74,897,570
1875	73,390,989
1876	85,145,116
1877	73,614,274
1878	65,179,320
1879	58,082,970
1880	55,601,607.09

The number of pieces or plots of real estate upon the assessment rolls was, in 1878, 151,058; in 1879, 151,620; in 1880, 152,400. The number of names on personal books in 1880 was 14,764; the number of shareholders of banks, 20,888. The commissioners of public charities and correction, three in number, appointed by the mayor and confirmed by the board of aldermen, have charge of all applications for relief, or admission to hospitals, alms-houses, and nurseries, and voluntary committals to the work-house. The last report of the commissioners is for the year 1881, and shows expenditures for the year, $1,487,416. The total number of persons received in the department was 110,733, the average census being 10,695, nearly all passing through the city prisons and Bellevue hospital. The department of docks consists of three commissioners, appointed by the mayor and confirmed by the board of aldermen, for a term of six years, the president of the board receiving a salary of $6,500 per annum, and the other commissioners $3,000 each. The board has charge of renting, building, repairing, etc., the piers and bulkheads along the city water-front. The annual report of the department for the year Dec. 31, '84, showed an expenditure of $905,990; the revenues paid, $1,193,718. The total receipts during the period 1870–80, were $6,028,229.41; the total expenditures for the same period, $7,239,670.17. The city water-front is divided into ten districts, each of which is in charge of a harbor-master, under the supervision and control of the captain of the port: these harbor-masters have charge of the assignment of piers. The port wardens make surveys of vessels deemed unseaworthy, and of damaged cargoes; and also valuations and measurements of vessels and cargoes. Pilots are licensed by the board of commissioners of pilots, and are authorized to demand fees for pilotage, and half-fees where their services are offered, whether accepted or refused.

History.—The history of the city is that of the state until the beginning of the 18th century. See NEW YORK, state. At the close of the 17th c. there were not more than 800 dwelling-houses, and about 5,250 inhabitants, white and black, the latter being in the proportion of about one in six. The first Trinity church was built in 1696; and about 5 years later Wall street had been paved; the city was policed by regularly appointed watchmen; and (in 1711) a slave-market was established. The first Presbyterian church was built in 1719; the first newspaper in the city, the *New York Gazette*, was established in 1725; and a few years later communication with Boston was furnished regularly by stages, which occupied two weeks in making the trip. Severe epidemics of measles and malignant pleurisy are noted as having been very destructive of life during the first quarter of this century; and a pestilent fever, brought from St. Thomas, carried off 1 in 10 of the population in 1702. Zenger's *Weekly Journal*, which was founded in 1733, was prosecuted for libel two years later, and Zenger himself imprisoned—the first attack on free speech in the country. The trouble grew out of a quarrel about a claim for fees between an outgoing and an incoming governor of the colony. The year 1741 brought pestilence, a great fire, and the extraordinary so-called negro plot. See NEW YORK, city, *ante*. The first theater in the city was established in 1750: five years later St. Paul's church was erected. In that year was the popular excitement over the stamp act, which act was publicly burned, and the colonial congress assembled in the city. The year 1765 saw the organization of the sons of liberty, and the movement for freedom from the mother-country was fully begun. In 1770 the statue of George III. in the Bowling Green was destroyed, and the obnoxious duty on tea was resisted; though it was not until 1774 that a ship laden with tea was sent back to England, 18 chests which had been secretly landed being destroyed. Between Aug. 26, 1776, and Nov. 23, 1783, the city was in the hands of the British. See NEW YORK, state. In 1790 the population had grown to 29,906, and the city limits extended to the lower corner of the present city hall park. In 1789 there was an epidemic of yellow fever, which carried off more than 2,000 victims. The corner-stone of the present city hall was laid on Sept. 20, 1803, and the building was finished in 1812. The year 1804 brought a great fire in Wall and Front streets, when 40 stores were destroyed. In 1805 the city had 78,770 inhabitants. In 1807 Robert Fulton made his first steamboat voyage to Albany, and 5 years later commenced running the ferries to Long Island by steam. The first experiments with gas-lighting were made in 1812, but gas was not generally used until 1825. The first boat

from the Erie canal arrived in the month of November in the latter year. In 1832 an epidemic of cholera carried off 3,500 persons, and 2 years later appeared again with a mortality of about 1000. The great fire of 1835 occurred Dec. 16, and destroyed the whole east side of the city below Wall street, including 648 stores, the merchants' exchange, and the South Dutch church, the entire loss being $18,000,000. In 1837 a financial panic brought failures, suspensions, and general loss to the entire country. In 1840 the population was 312,700. The Astor place riot in 1849, and the cholera epidemic of that year, which destroyed 5,071 persons, were the important events of the first half of the present century. The first city railroad was built in 1852, and on July 14, 1853, the Crystal palace industrial exhibition was opened to the public with striking ceremonies, the president of the United States officiating. A second financial panic occurred in 1857, with the usual following of suspensions of banks and business failures. This year witnessed the riotous demonstrations growing out of a conflict between two police organizations under the mayoralty of Fernando Wood, for whose arrest an order was issued and resisted, the 7th regiment of militia at length being called in to protect the public peace and carry out the law. Rioting recommenced on July 4, and 11 persons were killed. From 1860 to 1865 the city was engaged in patriotic and generous service in behalf of the union, threatened by the secession of the southern states. In the fall of 1873 occurred the great financial panic which began with the failure of Jay Cooke & Co., heavily embarrassed with the affairs of the Northern Pacific railroad. During several years at this period took place the investigation into the acts of the so-called "Tweed ring," by which, through malfeasance in office, the city had been plundered of many millions of dollars. The arrest, trial, and condign punishment of most of the offenders and the death of Tweed himself in prison formed the conclusion of this scheme to despoil the city.

NEW YORK, COLLEGE OF THE CITY OF, is the only free college supported by city taxpayers in the United States. It began its existence as the free academy in 1848, having first received the sanction of a popular vote, and its present title was bestowed upon it in 1866. Standing at the head of the public school system, its trustees are the members of the board of education together with the president of the college. It has had but two presidents, Horace Webster. LL.D., and from 1869, Alexander S. Webb, LL.D. The other officers comprise 14 active professors and 3 emeriti, and 21 tutors. Tuition, books, and stationery are free, all expenses being paid on presentation of vouchers to the comptroller of the city, who disbursed in 1878–79, for this institution, $131,535.48. Candidates for admission to the college must be 14 years of age, have attended a public school for at least one year, and must pass an examination on the studies taught in the grammar schools. Students have the option of a five years' classical or scientific course, the first year being considered introductory; there is also a commercial course for introductory students remaining but one year, and a post-graduate course of civil engineering. Since its foundation the college has had over 10,000 students. The year 1884–85 began with 920 students, of whom 560 were in the introductory and 351 in the collegiate classes, and the graduating class of 1885 numbered 39. The buildings and grounds on the s.e. corner of Lexington av. and e. 23d st. are valued at $190,000; the library of 21,000 volumes at $59,000; the apparatus, cabinets, casts, models, etc., at more than $20,000; and the institution has library and medal funds aggregating $40,750.

NEW YORK, UNIVERSITY OF THE CITY OF, was chartered in 1831, and began to receive students the next year. Its present building on the e. side of Washington sq. was completed in 1835; it is 180 ft. long by 100 ft. in width, of white freestone. The medical department is located at the foot of e. 26th st. opposite Bellevue hospital. The faculty of the four departments of the university consists of a chancellor and 80 instructors; embracing 12 professors and two adjunct professors in the arts and sciences; a president and 3 professors of law; and 18 professors, 8 lecturers, and 18 assistants in medicine. In 1884 the number of students was 725, divided into 100 students of the arts and sciences, none in the school of art, 61 in the law, and 558 in the medical departments. There were 212 graduates from all the departments the same year. The tuition fee of $80 a year was abolished for the academical department about 1870, and each student now pays but $15 annual dues for incidental purposes. The university is supported by the fees of its law and medical students, the rent of a portion of its main building, and the interest on an invested endowment of nearly $200,000. Its buildings are valued at $300,000, libraries at $23,000, and furniture and scientific apparatus at $10,000. The first chancellor of the institution was the rev. Dr. James H. Matthews, and the rev. Dr. H. Crosby held the office several years. Rev. Dr. J. Hall is temporary chancellor.

NEW ZEALAND, a British colony in the south Pacific ocean, consists of three islands, two large and one much smaller, and of a number of islets scattered round the coasts. These islands, which are named respectively north, south (sometimes also middle), and Stewart's island, are situated 6,500 m. w. from the coast of south America, and about 1200 m. s.e. of Australia. The groop is irregular in form, but may be said to extend from the s. in a n.n.e. direction, and like the peninsula of Italy, resembles a boot in shape. North island is 500 m. long, and 200 m. in greatest breadth from e. to w.; south island is 550 m. long, and 210 m. in greatest breadth; Stewart's island is triangular in

shape, and has an area of about 900 square miles. Area of the three islands about 100,000 sq. miles. The north is separated from the south island by Cook's strait, which is 18 m. wide at its eastern and 90 m. wide at its western end; the south is separated from Stewart's island by Foveaux strait, which averages about 20 m. in width. The group extends in lat. from 34° 15′ to 47° 30′ s., and in long. from 166° to 179° e.; being thus almost the antipodes of the British isles.

Coast Line.—Of the entire coast line of about 4,000 m., nearly 1500 m. is formed by the shores of north island, which are deeply indented, and contain many exeellent harbors. Commeneing from north eape, and going s.e. round the island, the chief harbors are Monganui, Wangaroa, the bay of islands, Auckland, Mereury, and Tauranga bays, and the ports of Wellington, Manukau, and Hokianga. On the n. and s. coasts of south island, which are much broken, the harbors are numerous and excellent; on the eastern coast, the principal harbors are Akaroa, Victoria, and Dunedin. On the coast of Stewart's island, there are also good ports.

Surface.—The New Zealand islands are of voleanie origin, and a great portion of the entire area is oecupied by mountains, among whieh are many extinct and a few active volcanoes. In north island, mount Ruaperhui, the highest summit of the eentral range, is 9,100 ft. in height, and is capped with perpetual snow, In the same range is Tongariro, an aetive voleano, 6,500 ft. high. A eontinuous range of mountains runs along the western eoast of south island, and assumes the form of table-lands and isolated peaks toward the east. This range rises in mount Cook to about 13,000 feet. In Stewart's island, the greatest elevation is about 3,000 feet. In north island, the mountains are mostly clothed with evergreen forests of luxuriant growth, interspersed with fern-clad ranges, and occasionally with treeless grassy plains; extensive and rieh valleys and sheltered dales abound; and in the east of south island there are many expansive plains of rich meadow-land, admirably adapted either for agriculture or eattle-breeding. Water and water-power are found in great abundanee in the colony, and the numerous rivers are subjeet to sudden floods from the melting of the mountain snows. As a rule, however, the streams are short, and are not navigable for more than 50 m. above their mouths. The chief is Waikato river, in north island, whieh, issuing from the Taupo lake (30 m. long by 20 broad), flows in a northern direction for 200 m., and reaehes the sea on the w. coast. In south island, the rivers Clutha, Mataura, and Waiau, all flowing s., are among the ehief. Around lakes Rotomahana and Rotorua are a number of grand and beautiful geysers, whieh throw up water heated to 2° above the boiling-point. The geology of New Zealand is remarkable in a high degree. The mountains, whieh are of every variety of outline, are chiefly composed of the lower slate-roeks, intersected with basalt, and mixed with primary sandstone and limestone. Beds of eoal and lignite exist, and the former have been to some extent worked.

Soil, Climate, and Productions.—Of the whole surfaee-extent of New Zealand (nearly 70,000,000 acres, little short of the eombined area of England and Wales, Scotland, and Ireland), one-fourth is estimated to consist of dense forests traets, one-half of exeellent soil, and the remainder of waste lands, seoriæ-hills, and rugged mountain regions. Nearly 40,000,000 acres are supposed to be more or less suitable for agriculture and cattle-breeding. The soil, although often elayey, has in the volcanic districts more than a medium fertility; but the luxuriant and semi-tropieal vegetation is perhaps as much due to exeellence of climate as to riehness of soil. Owing to the prevalenee of light and easily-worked soils, all agricultural proeesses are performed with unusual ease. The climate of New Zealand is one of the finest in the world. The eountry contains few physieal sourees of disease: the average temperature is remarkably even at all seasons of the year, and the atmosphere is eontinually agitated and freshened by winds that blow over an immense expanse of ocean. In a word, the elimate much resembles that of England, with half the cold of the English winter; while the summer is longer and somewhat warmer, the atmosphere is more breezy and pure, and there are many more fine days throughout the year. In north island, the mean annual temperature is 58°; in south island, 52°. The mean temperature of the hottest month at Auekland is 68°: and at Otago, 58°; of the coldest month, 51° and 40°. The air is very humid, and the fall of rain is greater than in England, but there are more dry days. All the native trees and plants are evergreens. Forrests, shrubberies, and plains are elothed in green throughout the year, the results of which are, that cattle, as a rule, browse on the herbage and shrubs of the open country all the year round, thus saving great expense to the cattle-breeder; and that the operations of reclaiming and cultivating land ean be carried on at all seasons. The seasons in New Zealand are the reverse of ours; January is their hottest month, and June the eoldest. All the grains, grasses, fruits, and vegetables grown in England are eultivated in this country with perfect success, being exeellent in quality and heavy in yield; while, besides these, the vine is cultivated in the open air, and maize, the taro, and the sweet-potato are cultivated to some extent in the sunny valleys of north island. The entire acreage under crop in New Zealand in 1851 was 29,140; in 1858, it was 141,007: in 1881, 4,768,192, while in 1871 the total acreage feneed was 6,778,733. Of the erops, the principal were wheat, oats, barley, potatoes, and sown grass, whieh, under ordinary circumstances, are grown to great advantage in New Zealand. Besides a few harmless lizards, a small speeies of rat is the only indigenous four-footed animal found in either of the great islands. Hawks are numerous. The coun-

try is destitute of snakes, and possesses no insect so noxious as the English wasp. The pig, introduced by Cook, runs wild, and the red and fallow deer, the pheasant, partridge, quail, etc., and the commoner domestic animals introduced by colonists, thrive well. In March, 1874, there were in the colony 99,859 horses, 494,917 cattle, 11,704,853 sheep, 123,921 pigs, and 1,058,198 heads of poultry, besides mules, asses, and goats. Coal in in abundance, and of good quality, as well as iron, gold, silver, tin, copper, etc, are distributed over the colony. For statistics of the quantity of gold exported, see article OTAGO. Valuable timber is in great abundance. In 1883, the revenue (of which the sources are principally customs' receipts, and sale of crown lands, amounted to £3,871,-267; the debt of the general government to £31,385,411. In 1875, the debt was under £14,000,000. The exports, consisting principally of wool, corn, gum, preserved meat, and gold, amounted, in 1882, to £6,658,008; the wool of that year being valued at £3,175,415. The total exports of gold from 1857 to 1880 were 9,552,194 oz., in value £37,380,633. The imports, consisting of British manufactures, etc., amounted to £8,609,270 in 1882. At the end of 1883 there were 1,358 m. of railways in operation, and many in course of formation; there were also 8,500 m. of telegraphic wires erected. The revenue of the post office in 1876 was £129,263.

The colony was divided into the following nine provinces: Auckland, Taranaki, Wellington, Hawke's Bay, Nelson, Marlborough, Canterbury, Otago, and Westland. The provinces were abolished by the colonial parliament in 1875, and a system of counties substituted. The government is administered by a governor appointed by the crown, and a ministry, a legislative council nominated by the crown and a house of representatives elected by the people. Leading educational institutions are the university of N. Z. (which grants degrees), the university of Otago, and Canterbury college, with numerous high schools for higher and secondary education, and private schools. A very large proportion of the population of European descent can read and write, more particularly in Otago. The principal churches are the Church of England, predominating in Canterbury; the Presbyterian church, which predominates in Otago and Southland; the Wesleyan; and the Roman Catholic. In 1875 the immigrants into New Zealand amounted to 31,737 persons; the emigrants from it, to 6,467; leaving a balance of 26,270 in favor of immigration. The population in 1858 was 59,328; in 1871, 256,260; and in 1881, 489,933. The New Zealanders, or Maoris (q.v.), estimated, in 1867, at 38,540, and in 1881, at 44,099, are mostly located in North island. The military and civil forces of New Zealand are the volunteers, numbering 8,500 of all ranks, and the armed constabulary in the North island. The hospitals and charitable institutions are numerous.

New Zealand was discovered by Tasman in 1642, and was repeatedly visited by capt. Cook, who surveyed the coast in 1770. After the settlement of Port Jackson, in New South Wales, the English and American whaling ships had recourse to the coast of New Zealand for provisions and shelter. New Zealand flax came also to be an article of traffic, and individual Englishmen began to settle on the coasts, and intermarry with the natives, and acquire land in right of their wives or of purchase. Missionary enterprise began in 1814, favored by various chiefs, and the missionaries not only labored to convert the natives, but introduced improved culture among them, and tried to protect them from the injustice, fraud, and oppression of the Europeans that had acquired settlements. A British resident or consul was appointed in 1833, but without authority. To put an end to the state of anarchy induced by a disultory colonization, and the purchase of lands for a few hatchets or muskets, a lieutenant-governor was appointed in 1840, and a treaty concluded with the native chiefs, whereby the sovereignty of the islands was ceded to Britain, while the chiefs were guaranteed the full possession of their lands, forests, etc., so long as they desired to retain them: the right of pre-emption, however, was reserved for the crown, if they wished to alienate any portion. Thus New Zealand became a regular colony, the seat of Government of which was fixed on the bay Waitemata, and called Auckland. The previous year an association, called the New Zealand company, had made a pretended purchase of tracts amounting to a third of the whole island, and for a dozen years most of the colonization of New Zealand was conducted under its auspices. The conduct of the company is considered to have been on the whole prejudicial to the prosperity of the colony; and after a long conflict with the government, they resigned, in 1852, all their claims—which the government had never confirmed—on condition of receiving £268,000 as compensation for their outlay. The unscrupulous way in which the company and others often took possesion of lands brought on, between 1843 and 1847, a series of bloody conflicts with the warlike natives, whose hostility, after having subsided for some time, in 1861 again broke out in a series of intermittent struggles. These continued until, on the withdrawal of the imperial troops, the colonists, from their knowledge of bush life and intensified earnestness, completely subdued the refractory natives, who are now turning their attention to agriculture and trade. In 1852 constitutional government was established, and in 1865 the seat of government was transferred from Auckland to Wellington, the present capital.

NEW ZEALAND FLAX. See FLAX, NEW ZEALAND.

NEXT FRIEND is, in English law, the name given to the person in whose name, or rather by whose agency, an infant—i.e., a person under the age of 21—sues in the courts of law and equity. The object is chiefly to have some party responsible for costs in case

the infant fails in the action. In practice, the father, if alive, is usually the next friend, but any substantial person may be so. In the court of chancery, a married woman sues or appears by the intervention of a next friend, where she is personally interested.

NEY, MICHEL, a celebrated marshal of the first French empire, was the son of a cooper, and was born at Saarlouis, Jan. 10, 1769. He was a non-commissioned officer in a hussar regiment when the revolution began, and afterwards rapidly rose to high military rank. For the capture of Mannheim by a *coup de main,* he was made a general of division in 1799. He was interim commander of the army of the Rhine for a short time, during which he frustrated by a bold diversion an important movement of the archduke Charles against Massena and the army of Switzerland. After the peace of Luneville, Bonaparte, anxious to win Ney, with other republicans, to his party, brought about his marriage with a young friend of Hortense Beauharnais, and appointed him inspector-general of cavalry. On the establishment of the empire, he was made a marshal. In 1805 he stormed the intrenchments of Elchingen, and was created duke of Elchingen. He afterwards rendered important service in the Tyrol; contributed much to the French successes of 1806 and 1807; and served in Spain with great ability in 1808 and 1809, till he was dismissed by Massena, the commander-in-chief, on a dispute about the plan of the campaign. Chagrined by this, and dissatisfied with Napoleon's despotism, he remained for some time inactive; but in 1812 received the command of the third *corps d'armée,* and greatly distinguished himself at Smolensk and the Moskwa, in consequence of which he was created prince of Moskwa. He also displayed great abilities in the French retreat. He had a principal part in the campaigns of 1813 and 1814, but after the capture of Paris, he urged the emperor to abdicate, and submitted to Louis XVIII., who loaded him with favors. On Napoleon's return from Elba, Ney assured the king of his fidelity, and was sent against Napoleon at the head of 4,000 men; but finding the emperor to be received with general enthusiasm, and his own soldiers to be favorable to his cause, Ney went over to his side. In the battle of Waterloo, he commanded the center, and had five horses shot under him. After the capitulation of Paris, he yielded to the entreaties of his family to retire to Switzerland; but a costly Egyptian saber, the gift of Napoleon, led to his being suspected by an official, and arrested. He was condemned to death for high treason, and was shot in the garden of the Luxembourg on the Dec. 7, 1815. He left three sons, who published his *Mémoires* (2 vols. Par. 1833).

NEZ PERCÉS, a co. in n.w. Idaho, bounded w. by Washington territory; drained by the Clearwater, Salmon, and Lewis or Snake rivers; about 6,000 sq.m.; pop., 1880, 3,965—198 Chinese. In the e. part, which is monntainous, gold is found; in the central the surface is level and adapted to farming. The reservation of the Nez Perces Indians lies further west. Wheat, oats, barley, potatoes, and dairy products, are the staples. Co. seat, Lewiston.

NEZ PERCÉS INDIANS, vs. SAHAPTIS, a tribe of Indians now occupying large reservations in Idaho and Indian territories and to which they were removed from Washington territory and Oregon. They made a treaty with capt. Lewis and Clarke about 1805. From 1832 to 1847 a Christian mission was maintained among them. The tribe has generally been friendly to the whites, but has not attained a high degree of civilization. In 1854 a treaty was made by a part of the tribe, now known as treaty Indians, but a large number held out against it and were very often engaged in war with the Sioux. Among the reservation Indians' missions have been established, and books have been printed in their language, which have many grammatical peculiarities. They own large droves of cattle and horses. There are now about 1,300 Indians on the reservation in Idaho, and 290 in Indian T. (the latter, removed to Idaho and W. Territory, 1885).

N'GA'MI, LAKE. The existence of lakes in the interior of Africa was vaguely known as far back as the days of Herodotus; and the earliest modern maps show at least half a dozen large and small, one of which is about the size, and very nearly in the position of that shallow reservoir of surface drainage which was discovered, or at least first visited, by a European in 1849, when Dr. Livingstone and Mr. Oswell, who were aware of its existence from native report, reached its shores by a circuitous route from the Cape Colony. Although since ascertained to be of little importance in the physical geography of these regions, lake N'gami was at first supposed to be in some way connected with the larger inland seas of Nyassa, Victoria Nyanza, and Tanganyika. It is situated between the 20th and 21st parallels of s. lat., and between the meridians 22° 10′ and 23° 30′ e. long., at a height of about 2,500 ft. above the level of the sea, and is connected by a series of sluggish anastomosing streams with the river-system of the Zambezi; its extent as well as depth varies with the fall of rain in the country to the n. of it, but its average size may be taken at 70 m. long, by a breadth of 20 and a depth varying from 3 to 28 feet. In 1853 lake N'gami was reached from the w. coast near Walfish bay by the traveler Andersson, and there is now a well-beaten route for traders between these two places, and a considerable quantity of ivory and ostrich feathers are annually collected in the neighborhood of the lake. The principal characteristics of the region are rivers, with very sluggish current, and often flowing in different directions to and from the lake, large salt pans and extensive dry flats, covered with dense bush, the haunt of elephants and other large animals. The water of N'gami is generally fresh, but in the dry season becomes brackish. The e.

end is much deeper than the western, and it has been inferred that during the last c. the shape and size of the lake have undergone material alterations. The chief tributary, the Tonke or Tioge, coming from the n.w., is deep, and in June, July, and August brings down vast volumes of water. The Suga or Zouga is the main outlet, runs towards the s.e., and finally disappears in a large salt-marsh.

NGAN-KING, a large and wealthy city of China, the capital of the province of Ngan-whi. It stands on the left bank of the great river Yang-tze-Kiang, 190 m. s.w. from Nankin. The surrounding country is highly cultivated and very densely peopled. The mineral riches of the neighborhood are also considerable. Ngan-King is a place of busy trade, great part of the goods intended for Nankin passing through the hands of its merchants. The trade is carried on by means of vessels on the river. Porcelain and cloth are among the principal articles of trade.

NGAN-WHI, or NGAN-HOEI, an interior province of China; bounded n.e. by Kiang-soo, s.e. by Chekiang, s. by Kiangsee, on the w. and n.w. by Houpe and Honan; drained by the Hoai-ho and Yang-tse-Kiang rivers and their tributaries; 48,461 sq.m.; pop, 34,-168,059. The surface is mostly level, but broken to the s. and w. by ranges of hills of no great elevation. It contains a number of lakes, of which Chan-Hu or Nest lake is the most important. There are mines of gold, silver, copper, and other metals. The best green tea in China is grown in the s.e. portions of this province. Inks, varnish and lanterns are manufactured.

NIAGARA, a river of North America, which flows from lake Erie northwards into lake Ontario. It is about 36 m. in length, and its descent from the level of one lake to that of the other is about 334 feet. On issuing from lake Erie it is three-quarters of a mile broad; but as it flows on, it becomes several miles wide, making room for a number of islands, the largest of which, Grand island, is 12 m. long, and from 2 to 7 broad. At the foot of Grand island, which reaches within 1½ m. of the *falls of Niagara*, the river is contracted to a breadth of 2½ m., and grows narrower as it proceeds. By this and by the descent in the channel, which is about 60 ft. in the mile above the falls, are produced the swift currents known as the *Rapids*, in which the river, notwithstanding its great depth, is perpetually white with foam. At the falls, which are 22 m. from lake Erie, the river is divided by an island containing about 75 acres, called Goat island; but in consequence of a bend in the channel, by far the larger portion of the water is sent down by the Canadian side. On this side, therefore, is the grander cataract which has been named the *Horseshoe fall*, but no longer bears the name appropriately, as the precipice has been worn from a curved into a somewhat angular shape. This process of wearing away goes on gradually still, a large projection on the Canadian bank, known as the Table rock, having partly fallen off in 1863. The Horseshoe fall is above 600 yds. in breadth, and about 154 ft. in height. The water is so deep that it retains its green color for some distance below the brow of the precipice; and it rushes over with such force that it is thrown about 50 ft. from the foot of the cliff. One may thus, having donned an oil-skin dress, enter two or three yards behind the curved sheet of water; but the spray is so blinding, the din so deafening, and the current of air so strong, that it requires a tolerably calm nerve and firm foot. The separation caused by Goat island leaves a large wall of rock between the Canadian and American falls, the latter being again divided by an islet at a short distance from Goat island. This fall is from 8 to 10 ft. higher than the Horeshoe, but only about 220 yds. broad. A little above the fall the channel is divided by Bath island, which is connected by bridges with Goat island and the American shore. A small tower, approached from Goat island, has been built on a rock over the brow of the Horse-shoe fall; and from this the finest view on the American side may be obtained, the Table rock on the Canadian side giving the completest view of the entire cataract. The falls can also be seen from below on both sides, and every facility is given for viewing them from all the best points, while magnificent hotels, Canadian and American, offer their inducements to the tourist to stay till he has received the full influence of the scenery. The river is crossed about 200 or 300 yds. below the falls, where it is 1200 yds. broad. The current is lessened for about a mile, but increases again as the channel becomes narrower and the descent greater. Between 3 and 4 m. below the falls, a stratum of rock runs across the direct course of the river, which, after forming a vast circular basin, with an impassable whirlpool, is forced away at right angles to its old channel. The celebrated wire suspension bridge for the Great Western railway, with a road beneath for vehicles and foot passengers, crosses the river 1½ m. below the fall; it is 800 ft. long, 40 broad, and 200 ft. above the surface of the water.

NIAGARA, a co. in the w. of New York on lake Ontario, traversed by the New York Central railroad and branches and by the Erie canal; 558 sq.m.; pop. '80, 54,173. The land is, for the most part, level, fertile, and well-cultivated; chief products, wheat, Indian corn, oats, and barley. The number of manufacturing establishments was in 1870, 421. They included flour mills, saw mills, woolen mills, and agricultural-tool works. Co. seat, Lockport.

NIAGARA, chief t. in Niagara co., in the Canadian province of Ontario, is situated on lake Ontario, at the mouth of the river Niagara, and is distant by water from Toronto 36 miles. Burned down in Dec. 1813 by the American gen. M'Clure on his retreat, it was

afterwards rebuilt, and promised to be a flourishing town; but its trade has fallen off within the last few years, and its population has decreased to about 1,441.

NIAGARA FALLS, a village in Niagara co., N. Y., on the Niagara river; pop. about 3,320. It contains several small hotels, and depends for its prosperity chiefly on the visitors to the falls.

*NIAGARA RIVER AND FALLS (*ante*), received their name from the Indians, in whose language the word *Niagara* means the "thunder of water." A record of a voyage in 1535 by a French mariner named James Cartier contains, it is believed, the first printed allusion to either. In 1603 the first map of the district was constructed by a Frenchman named Champlain; and 75 years later the river and the cataract were visited by Father Hennepin and described at some length in a book. The river receives the waters of all the upper lakes—the Erie, St. Clair, Huron, Michigan, Superior, and a number of smaller ones; and neither the snows of winter nor the evaporation of summer, neither rains nor drought, materially affect it. Its waters flow on, full and clear, perpetually the same, with the exception that about once every seven years they have a gradual rise and fall, which is attributed to some undiscovered disturbance that affects lake Erie. From the foot of the falls to Lewiston, a distance of 7 m., the river descends 104 ft., running between perpendicular walls 250 ft. high; then the height of the chasm gradually diminishes the next 7 m., and during the remainder of its course to lake Ontario, until it is only about 25 feet. It has long been a theory with geologists that this deep chasm, and consequently the gigantic cataract, has been made by the action of the water on the limestone strata through countless ages. Originally, it is believed, the falls were simply from the plateau that overlooks lake Ontario at Lewiston. Within the short period even of less than a hundred years many changes have occurred that are significant in connection with this opinion. In 1818 large parts of the edge of the precipice on the American side of the falls broke down; in 1828 fragments descended from the Horseshoe falls; and since 1855 several other pieces have broken away. An able report of prof. James Hall, in 1842, for the state geological survey, also shows that the falls at that time were different in important respects from the description given of them by Father Hennepin, who described a third fall from the Canadian side toward the e., facing the line of the main fall, and caused by a great rock that turned the divided current in this direction. Sir Charles Lyell—in whose work, *Travels in North America*, may be found the most complete accounts of Niagara—estimates that the falls wear away about one foot of the precipice every year. See *Supp.*, page 889.

NIARE, *Bos brachicheros*, the wild ox or buffalo of tropical Western Africa, is in size and weight about equal to the smaller breeds of British oxen, but of greater strength. The head is rather small, the muzzle black, the ears long and pointed, and fringed with beautiful silky hair, several inches long. The horns are 10 or 12 in. long, curved backwards, and sharply pointed. The animal is gracefully proportioned, having nothing of the clumsiness of the common buffalo. The body is covered with a coat of thin red hair. The tail is tufted at the extremity with black hair several in. long. Herds of these oxen were seen by Du Chaillu in the open or prairie lands to the s. of the mouth of the Ogobai. They are shy and fierce; if wounded, they turn upon the hunter with terrible fury. No attempt seems yet to have been made to domesticate this animal, which is probably very capable of it, and might be found more suitable than other oxen for warm climates.

NIAS, an important island belonging to Holland, lies to the w. of Sumatra, in 0° 18′ 54″—1° 35′ n. lat., and 97°—98° e. long., and has an area of about 1,575 sq. miles. In 1857, when the Dutch took complete possession of the island, the population was reckoned at 170,000. There are several places where ships can anchor and take in provisions, water, etc. On the e. coast is the village of Nias, and on the w. Silorongang. Little islands and coral reefs lie here and there on the coast, which in some places is steep, while mountain-chains run from the s.e. to the north-west. There is a greater breadth of excellent farming-grounds than the population, reduced by internal wars and the exportation of slaves, can properly cultivate. They grow rice, cocoa-nuts, bananas, tobacco, sugar-canes, etc., and annually about 110,000 lbs. of pepper. Cattle and horses have been imported, and they pay great attention to the raising of pigs and fowls. Formerly, about 500 Niassers were carried away annually as slaves to Batavia and other places, and though this traffic has been in a great measure suppressed, it is still to some extent carried on.

The Niassers are of the Malay race, but fairer than the Malays usually are. They are gentle, sober, and peaceful, remarkably ingenious in handicraft, ornamenting their houses with wood-carvings, forging arms, etc. The women labor in the fields, the children weave mats, while the men look after the live-stock, and hunt the deer and wild swine. They worship a superior deity, and fear a powerful one, who pursues them if they do evil. Polygamy is permitted, but is rare. The gift to the bride's family is from 60 to 500 dollars. Divorce is not allowed, and adultery is punished by the death of both parties. Dead bodies are placed in coffins above the ground, and creepers and flowering shrubs planted, which speedily grow up and cover them. Trade is on the increase.—See *Malayan Miscellanies*, vol. ii.; *Het Eiland Nias, door* H. J. Domis; Crawford's *Descriptive Dictionary* (London, 1856); *Tydschrift voor Ned. Indië*, 1854, 1860, etc.

NIASSA. See NYASSA, *ante.*

NIBBY, ANTONIO, a Roman archæologist of high celebrity, was b. in 1792. He was one of those who, following in the footsteps of Winckelmann, made an elaborately minute investigation of the remains of antiquity their special study. The first work that made him known was his translation of Pausanias, with antiquarian and critical notes. In 1820 he was appointed professor of archæology in the university of Rome. In the same year appeared his edition of Nardini's *Roma Antica;* and in 1837–38, his learned and admirable *Analisi Storicotopografico-antiquaria della curta de Contorni di Roma*, to which was added (1838–40) a description of the city of Rome itself. Among his other writings, may be mentioned his *La Mura di Roma disegnate da W. Gell,* and a large number of valuable treatises on the form and arrangement of the earliest Christian churches, the circus of Caracalla, the temple of Fortuna at Prænestе, the graves of the Horatii and the Curiattii, etc. Nibby d. Dec. 29, 1839.

NI'BELUNGENLIED, or '*Niebelunge Not,*' as the words are written in the oldest manuscripts, is one of the most finished specimens of the genuine epic of Germany belonging to the middle ages. There exist twenty more or less perfect manuscript copies of this curious poem, the earliest of which belong to the beginning of the 13th c., from which period till the middle of the 16th c. it enjoyed the greatest popularity among Germans of all classes. Nothing certain is known of the author or authors of the work beyond the fact, that it was put into its present form by a wandering minstrel in Austria about or prior to the year 1210, which is the date of the oldest accredited manuscript. According to W. Grimm and Lachman's critical analysis of the poem, it is in itself a compilation of pre-existing songs and rhapsodies, strung together into one whole upon a plan remarkable for its grand simplicity, although less skill is shown in some instances in the manner in which the several parts are connected. In the more authentic manuscripts the poem consists of only twenty parts, and it is conjectured that the latter portions of the epic, which are given only in some of the texts, as that of St. Gall, are the composition of later compilers. The epic cycle embraced in the Nibelungenlied may be more specially regarded as the fusion of the history of the mythical people, called in the poem the Nibelungen, with five leading groups of myths, in which are incorporated the adventures of some of the most universally popular personages belonging to the semi-historic myths of mediæval German folk-lore, as, for instance, the hero Siegfried with his mantle of invisibility, and the lovely Icelandic heroine Brunhilt; King Günther of Burgundy, and his fair sister, Kriemhilt, the wife of Siegfried; Haco of Norway, Dietrich (Theodoric the great king of the Ostrogoths) of Berne (Verona), and Etzel (Attila), king of the Huns. The loves and feuds, and the stormy lives and violent deaths of these national heroes and heroines, are skillfully intertwined in the Nibelungenlied, and artistically made to center round the mythical treasure of the Nibelungen, which, after the murder of Siegfried, who had brought it from the far north, is secretly buried by his murderer Haco beneath the Rhine, where it still remains. The poem, in its rude but strict versification, tells the tale of Kriemhilt's vengeance for her husband's death with a passionate earnestness that carries the sympathies of the reader with it, until the interest culminates in the catastrophe of the fierce battle between the Burgundians and Huns at the court of Etzel, whose hand Kriemhilt has accepted, the better to accomplish her purposes of revenge. The tale of horrors fitly closes with the murder of Kriemhilt herself, after she has satisfied her vengeance by slaying with Siegfried's sword his murderer Haco. This tale, which seemed to echo back the clash of arms and strife of passion which characterized the early periods of German history, kept a firm hold on the imaginations of the people till the taste for polemic writings, fostered, if not created, at the period of the reformation, caused this as well as many other treasures of folk-lore to be almost lost sight of and forgotten. Attention was again, however, drawn to it in the 18th c., by the publication of detached portions of the poem by Bodmer, *Criemhilden-Rache* (Zurich, 1751), and by Müller in his *Sammlung deutscher Gedichte aus dem* 12–14 *Jahrh.* (Berlin, 1782); but it was not until comparatively recent times that the value of the work in an historical and philological point of view was recognized. Lachmann made known the result of his investigations in 1826. His views were supported by Müllenhoff and Rieger (1856). Holtzmann (1854), on the other hand, asserted that the longest version is the more ancient, and was followed by Zarncke, Hermann, and Fischer. Pfeiffer tried, in 1862, to prove that the author of the present Nibelungenlied was the Austrian Von Kürenberg (*circa* 1140). See Paul's statement of the case in *Die Niébelungenfrage* (1877). All the manuscripts in the Nibelungenlied comprise another poem under the title of *Die Klage,* which treats of the burial of the heroes who fell in the conflict at Etzel's court, and the laments which were composed in commemoration of that event. It is of greater antiquity than the Nibelungenlied, and, like it, the work of an unknown author. A critical analysis of the Nibelungenlied will be found in Carlyle's *Miscellaneous Essays*

NICÆ'A. See NICE.

NICARA'GUA, a republic of Central America, bounded on the n. by the republic of Honduras, on the w. by the Carribean sea, on the s. by the republic of Costa Rica, and on the e. by the Pacific; lat. 10° 45′ to 15° n.; long. 83° 20′ to 87° 30′; area about 48,000 sq.m.; pop. estimated at 250,000, of whom about 30,000 are whites, 10,000 negroes, the rest Indians and Mestizoes. Nicaragua is traversed by two ranges of mountains—the

western, which follows the direction of the coast-line, at a distance of from 10 to 20 m. from the Pacific; and the eastern (a part of the great range of the Cordilleras), which runs nearly parallel to it, and sends off several spurs towards the Carribean sea. The former is generally high and volcanic, but sinks at times almost to the level of the plains. Between the two ranges lies a great interior basin, containing the lakes of Nicaragua (q.v.) and Managua. The principal rivers are the Rio Coco, or Segovia, forming part of the boundary between Honduras and Nicaragua; the Escondido, or Blewfields; and the San Juan, all of which flow into the Carribean sea. The eastern coast of Nicaragua is called the Mosquito coast. The country is in many places densely wooded—the most valuable trees being mahogany, logwood, Nicaragua wood, cedar, and Brazil wood. The pastures are splendid, and support vast herds of cattle. The chief products are sugar-cane (softer and juicier than the Asiatic variety), cacao, cotton, coffee, indigo, tobacco, maize, and rice, with nearly all the fruits, etc., of the tropics—plantains, bananas, tomatoes, bread-fruit, arrow-root, citrons, oranges, limes, lemons, pine-apples, guavas, etc. The chief vegetable exports are sarsaparilla, aloes, ipecacuanha, ginger, copal, gum-arabic, caoutchouc, etc. The northern part of Nicaragua is rich in minerals—gold, silver, copper, iron, and lead—but the mines are not so carefully worked now as under the Spaniards. The incessant political distractions of the country have notoriously all but destroyed the material prosperity of the country. The trade is chiefly with Great Britain. In 1882 the exports amounted to $419,702; the imports to $352,043. The seat of government is Managua, with 8,000 inhabitants; the largest town and former capital is St. Leon, with a population of 25,000. The town of Nicaragua (q.v. in SUPP., Vol. X.) has a pop. of 8,500. There are over 90 m. of railroad, and 5,000 m. of telegraph.

Nicaragua was discovered in 1521 by Gil Gonzales de Avila, and conquered by Pedro Arias de Avila, the governor of Panama in 1522. In 1821—the great year of revolution in Central America—it threw off allegiance to Spain, and after a desperate and bloody struggle, secured its independence by the help of the "liberals" of San Salvador. Nicaragua now became the second state in the federal republic of Central America, but on the dissolution of the union in 1839 became an independent republic. In 1847-48 a dispute broke out between Nicaragua and Great Britain about the Mosquito coast, which led to some hostilities, and was only finally settled in 1860. Meanwhile, in 1855, a civil war had broken out between the so-called "conservatives" and "liberals," which resulted in the victory of the latter, who were, however, obliged to call in the help of the since notorious col. William Walker (see FILLIBUSTERS).

By the constitution of Aug. 19, 1858, the republic of Nicaragua is governed by a president, who is elected by universal suffrage, and holds office for four years. There are two legislative chambers—the senate and the house of representatives. Liberty of speech and of the press exists, but is not absolutely guaranteed. The Roman Catholic religion, however, is the only one *publicly* tolerated, but the services of other religious bodies may be privately performed.

NICARA'GUA, LAKE (native, *Cocibolca*), a sheet of fresh water in the republic of the same name, 110 m. long, and from 30 to 50 broad. Its elevation above the Pacific, from which it is separated by a low range of hills—at one point only 48 ft. higher than the lake itself—is little more than 100 feet. The principal rivers flowing into it are the Mayales and Malacoloja on the n. and the Frio on the s.; the only one flowing out is the San Juan (formerly *Usaguadero*), which unites it with the Carribean sea. Its islands are numerous, lying mostly in groups; the principal are Ometepec, Zapatero (uninhabited, but with extensive ruins and monolithic idols), Salentanami, and the Corales. It now in contemplation to cut an interoceanic ship-canal through the state of Nicaragua, the route being by way of the San Juan river and lake Nicaragua. The whole distance by this route from ocean to ocean is 180¾ m.; and, full advantage being taken of lake and river, 61¾ m. of the total length will fall to the share of the new canal.

NICARA'GUA, or RI'VAS, a t. of the republic of Nicaragua (q.v.), Central America, on the western shore of the lake Nicaragua (q.v.), 35 m. s.s.e. from Granada. It is not a place of much commerce, the commerce of the lake being chiefly carried on by Granada. Pop. 8,500.

NICARA'GUA SHIP-CANAL. See INTEROCEANIC SHIP-CANAL.

NICASTRO, a t. of s. Italy, in the province of Calabria, is most beautifully situated w. of the Apennines, on the margin of the coast plains, and commanding views of the sea, 24 m. s. of Cosenza. It is the see of an archbishop. There are hot springs in the vicinity. Pop. stated at 7,000 and 10,200.

NICCOLA PISANO, a distinguished sculptor of Pisa, to the influence of whose works the rise or restoration of sculpture in connection with Gothic architecture is mainly attributable. There is no record of the date of his birth, but from an inscription on a celebrated fountain in Perugia, designed by him and executed by his son Giovanni, it is evident that he was born at the beginning of the 13th century. His earliest work is supposed to be the "Deposition," over one of the doors of the façade of the cathedral at Lucca, dated 1233. He worked on the principle of studying nature, modified or corrected by the ideal of antique sculpture; and it is said that he first adopted this principle from the sculpture on an ancient sarcophagus brought from Greece in the ships of Pisa;

but though most of the finest specimens of Greek sculpture were not discovered till long after Niccola's time, he must have had an opportunity of studying many important remains on the various classic ruins with which Italy abounds. This sculptor's reputation is supported by three important works, which remain and are still admired for their excellence—the pulpit of the baptistery at Pisa, the "area" or shrine of St. Dominic for the church of that saint at Bologna, and the pulpit of the cathedral at Siena. The first of these was finished in 1260, and is reckoned the most elegant pulpit in Italy, It is of white marble, six-sided, supported by seven Corinthian columns, and adorned with five bas-reliefs of subjects from the New Testament. The second work, the "arca" of St. Dominic, is one of even greater extent. It is composed of six large bas-reliefs, delineating the six principal events in the legend of St. Dominic, and is ornamented with statues of our Savior, the virgin, and the four doctors of the church. The operculum or lid was added about 200 years afterwards. The subjects on the pulpit at Siena, the third of these works, are the same as those on that at Pisa, with the substitution of the "Flight into Egypt" and the "Massacre of the Innocents" for the "Presentation"; and the enlargement of the concluding composition, the "Last Judgment." In these compositions there is great felicity of invention and grouping, truth of expression, and grace in the attitudes and draperies; and in that of the "Last Judgment" the boldness displayed in the naked figures, twisted and contorted into every imaginable attitude, is wonderful, and evinces the skill with which Niccola drew on the antique and on nature. But it must be admitted that there is a degree of confusion or overfullness in the grouping, and that the heads of his figures are often large in proportion to the bodies; faults incidental to all early efforts. In this last work it appears by the contract for its execution that Niccola was assisted by his scholars Lapo and Arnolfo, and his son Giovanni; and this accounts for a certain feebleness that may be observed in portions of it. He died at Pisa in 1276 or 1277, and was buried in the Campo Santo. Niccola's influence on art extended widely; his pupils Arnolfo and Lapo executed numerous works at Rome, Siena, and other cities. His son and heir in reputation, though not his equal in talent, Giovanni Pisano, was constantly engaged on works of importance; in Pisa, where the Campo Santo (for he was also an architect) was erected from his designs; in Naples, which he visited on the invitation of Charles I. of Anjou; at Arezzo, where he executed the marble shrine of St. Donato for the cathedral; at Orvieto, the bas-reliefs on the *facerata* of the Duomo, by many ascribed to Niccola, being by him; at Pistoja, where he executed the pulpit, etc. The year of his death is not ascertained; it was probably about 1320; After Giovanni's death the Pisan school split into two principal branches, Florence and Siena; that of Naples may also be reckoned a branch, from the influence exercised over it by Giovanni.—Andrea Pisano, the ablest of Giovanni's pupils, was called to Florence to execute in marble the statues, bas-reliefs, etc., designed by Giotto in ornamenting the cathedral of S. Maria del Fiore, then in course of erection. The talent he displayed soon raised him to a high position and important employment. He executed numerous statues for the façade of the cathedral, and a bronze gate for the baptistery, of very great excellence. This gate still exists, along with the later and still more celebrated gates of Ghiberti. Under the influence of Giotto's genius he became completely Giottesque in thought and style; and his works bear so distinctly the impress of that master-mind that the design of many of them, and particularly the baptistery gate, are ascribed to Giotto. He died in 1345, aged 76. See Vasari; *Christian Art,* by lord Lindsay; Agincourt, *Davia Memorie Istoriche;* Rosini, *Storia, etc.;* Cicognara (tom. i.), *Monumenti Sepolcrali della Toscana.*

NICCOLINI, Giovanni Batista, a distinguished modern poet, was b. in 1785, in the vicinity of Pisa, of a noble but impoverished family. Niccolini's first literary efforts were full of high promise of the classical and antique beauties which characterize his finest compositions, and in 1810 he was crowned by the Crusca academy. Through the influence of the queen of Etruria he was appointed secretary of the academy of fine arts, where he delivered to the young artists lectures on history and mythology; but on the fall of the Bonaparte sovereigns this post was withdrawn from the poet. In 1805 the grand duke Ferdinand appointed him librarian in the Pitti palace, an office he resigned in order to escape the servility of court dependence. By the death of a relative he acquired wealth and the power of exclusively devoting himself to literature, and published several much-admired essays and lectures; and in 1827 appeared his noble work *Antonio Foscarini.* In 1844 Niccolini published anonymously his best poem—*Arnoldo da Brescia*—and nothing finer has been written in modern Italian, whether it be viewed as a classical creation, full of life and poetry, or as a work of glowing patriotism. Niccolini lived in the enjoyment of fame and honors to a ripe old age, and died at Florence in 1861.

NICE, or Nicæa, formerly a city of Bithynia, in Asia Minor, situated on the eastern shore of lake Ascania. It was built, or rather rebuilt (for an olden town had existed on its site), by Antigonus, the son of Philip (316 B.C.), and received the name of Antigoneia, which Lysimachus changed to Nicæa, in honor of his wife. It was a handsome town, and of great importance in the time of the Roman and Byzantine emperors; all the streets crossed each other at right angles, and from a magnificent monument in the center the four gates of the city were visible. It is famous in ecclesiastical history for two

councils held in it—the first and seventh ecumenical councils. The First Council of Nice was held 325 A.D., and was convened by the emperor Constantine, in concert, according to Roman Catholic historians, with the Roman pontiff, for the purpose of defining the questions raised in the Arian (q.v.) controversy. The details of the proceedings, so far as regards Arius, will be found in that article. The supporters of Arius at first are said to have numbered upwards of twenty; but ultimately the decree condemning him was subscribed by the whole body of the council, the number of dissentients being, according to the highest computation, only five, while the most probable account reduces it to two. The Nicene Creed adopted in this council forms the subject of a separate article. In addition to the Arian question the council of Nice also deliberated on a schism, called the Meletian schism, which at that time divided the church of Egypt, and the particulars of which have formed a subject of recent controversy. The decree of Nice appears to have been founded on a compromise, but did not effectually suppress the schism. The decree of Nice on the celebration of Easter was of wider application, and met with universal acceptance, the few recusants being thenceforward called quartodecimans (q.v.). This council also enacted twenty canons of discipline. For a minute and picturesque description of this council see Dean Stanley's *History of the Eastern Church*..—The Second Council of Nice, called also the seventh ecumenical council, was assembled under the empress Irene (787), who was regent during the minority of her son Constantine, for the purpose of reconsidering the subject of images. The tenor of the decree on images is detailed under that head. In the west the question of the acceptation of this council was the subject of considerable controversy, arising, in great measure, from a grossly erroneous Latin translation of the acts, which for a time obtained extensive circulation.

NICE (Ital. *Nizza*), chief town, since 1860, of the department of the Alpes Maritimes, France, is situated on both sides of the river Paglione, 100 m. s.s.w. of Turin, and about the same distance e.n.e. of Marseilles. Pop. '72, 42,363; '76, 46,683. It consists of three principal parts—the *Quartier de la Croix de Marbre*, or *New Town* (on the right bank of the Paglione), the *Old Town*, and the *Port*. The first of these is much frequented by foreigners, particularly English (whence its name of "English town"). It is close upon the river, has a handsome quay filled with gay shops, and a splendid square called the Jardin public. Two bridges over the Paglione connect it with the old or upper town, which extends back to the foot of a hill called the Castle hill. The old town is excessively dirty, and has narrow, stinking streets, with macaroni and confectionery shops, grocery establishments, slaughter-houses, etc. The port, almost separated from it by the Castle hill, is crowded with a seafaring population. The harbor admits vessels drawing 15 ft. of water, but it is difficult of entrance. The Castle hill, an isolated mass of limestone 800 ft. high, receiving its name from having been crowned by a strong castle, now in ruins, is laid out in public gardens, and affords an extensive and splendid prospect out to sea. The chief public buildings are in the Corso, or in the adjoining streets, in one of which there is an English library and reading-room. There is an Episcopalian, and also a Presbyterian church in Nice, and an English cemetery. The most attractive promenade in the old town is the *Terrace*, from 15 to 20 ft. high, erected as a protection to the town against a stormy sea. But the most agreeable and fashionable drive and promenade is the *Promenade des Anglais*, extending for a mile along the shore from the right bank of the Paglione, and skirted on one side by elegant villas and hotels. Beggars are numerous, owing, doubtless, to the great influx of visitors. Fine as the usual winter and spring weather of Nice is, it is exposed to the n. winds, or *mistral*, which during these seasons often brings a temperature which in England would be considered cool, or even cold, in April or October. The *Quartier Carabacel* is the most sheltered part of the place, and therefore the best for an invalid. Dust and bad drainage are the drawbacks to the amenity of Nice; but this is true with regard to most of the places of winter resort in the south. The mean January and February temperature is 47°, equal to that of April in England; March is 52°; April 58°, about the same as June in England, or July in Scotland.

The ancient Ligurian town of Nicæa, founded, it is said, by a colony of Phocæans from Massalia (Marseilles), became subject to Rome in the 2d c. B.C. It probably occupied the Castle hill, rather than the site of the present city. Subsequently it passed into the hands of the Goths, Burgundians, Visigoths, kings and counts of Arles, the Angevine sovereigns of Naples, and the dukes of Savoy (1388), in whose family it remained till 1860, when it was ceded to France.

NICE, COUNCILS OF, the first of which, held 325 A.D., is properly called ecumenical. It was convened by the emperor Constantine who, with the invitation sent to each bishop, provided public conveyance for himself, two presbyters, and three servants. The empire had at the time about 1800 bishops, 1000 of whom were in the Greek provinces, and 800 in the Latin. Of these, according to the statement of Athanasius, 318 attended the council, of which only 1 was from the Latin church. The total number of delegates, including presbyters and others, was probably more than 1500. The eastern provinces were largely represented. Many of the members were venerable and illustrious men, among whom were Eusebius, eminent for learning; Athanasius, then only a young deacon, attendant on the bishop of Alexandria, small and insignificant in person,

but conspicuous for intellect, eloquence, and zeal; Arius, a parish-priest of Alexandria, 60 years old, tall and emaciated in person, wild, sometimes almost to madness, in manner ascetic, and negligent in dress, yet having a sweet voice, and fascinating speech; Potamon of Herakles; and Paphnutius, of the upper Thebaid, whose right eye had been dug out with a sword, and the empty socket seared with a hot iron; Paul of Neo-Cæsarea, also scarred by the brand of hot iron which had crippled both his hands; Jacob of Nisibis, who had spent years as a hermit in forests and caves, subsisting on plants and roots; Spiridion of Cyrus, continuing, even after his ordination, a literal shepherd; Hosius of Cordova, the ablest and best of the western delegates; two Roman presbyters, influential as representing Sylvester, the bishop of Rome, who was kept at home by the infirmities of age; a Persian bishop from the eastern frontier, and a Gothic bishop from the north. Constantine's object in convening the council, as announced in his opening address, was to heal the divisions in the church, the system of which, he said, had surprised and distressed him. There were two principal controversies then raging—one of them doctrinal, relating to the nature of Christ, and the other ritualistic, having reference to the time for the observance of Easter. At the opening of the discussions on the former there seemed little prospect that the emperor's prayer for harmony among the delegates would be answered. Accusations and recriminations were banded to and fro without regard to his presence. He was unmoved amid the angry voices, turning from one side of the hall to the other, giving attention to the questions proposed, and bringing together the angry partisans. Laying aside his stately Latin he addressed them in broken Greek, praising some, persuading others, shaming a third class, and directing all his energies to the one point of securing unanimity of decision. The first sessions were devoted chiefly to a discussion of the Arian views, accompanied with an examination of Arius himself. He maintained that the Son of God was a creature, though indeed the most exalted of all; that he had been made out of nothing; that there was a time when he did not exist; and that, in his own free will, he was capable of right and wrong. The songs which he had written to popularize his opinions were sung in the council; and, apparently by himself, dancing like an eastern dervish while he uttered their wild, abstract statements in long straggling lines. The first attempt to reach a decision was made by producing an ancient creed of Palestine, the basis of that which was ultimately adopted, but opposed at first by the orthodox—the more violently, because the Arians were willing to adopt it. A letter having been read from Eusebius of Nicomedia, in which he declared that to assert the Son to be uncreated would be to say that he was of one substance (ὁμοούσιος with the Father; the expression was laid hold of as furnishing the very test for which they were seeking. The creed, as finally adopted, was as follows: "We believe in one God, the Father, Almighty, Maker of all things, both visible and invisible; and in one Lord, Jesus Christ, the Son of God, begotten of the Father; only begotten—that is to say—of the substance of the Father; God of God, Light of light, very God of very God; begotten—not made—being of one substance with the Father; by whom all things were made, both things in heaven, and things in earth; who for us men, and for our salvation, came down and was made flesh, and was made man; suffered, and rose again on the third day; went up into the heavens; and is to come again to judge the quick, and the dead; and in the Holy Ghost." But those that say "there was when He was not," and "before He was begotten He was not;" and that "He came into existence from what was not;" or who profess that the Son of God is a different person or substance; or that he is created, or changeable, or variable, are anathematized by the Catholic church. The second controversy determined at the first council of Nice had reference to the time for observing Easter, and was the most ancient in the church. Its name—the "quartodeciman"—or, fourteenth-day controversy, was derived from the Jewish rather than the Christian calendar. The question in dispute was, Ought the Christian passover to be celebrated on the same day as the Jewish—the 14th day of the month Nisan—or on the following Sunday? This fundamental question became entangled with others relating to the fast of 40 days, and to the changes in the vernal equinox. On the one side were the apostolic traditions, and on the other the new Catholic spirit seeking separation from Jewish ideas. At the date of the council the Judaic time was observed by the principal eastern churches; and the Christian time by the western churches, with a part of the eastern. The decision was in favor of the Christian time; not as a matter of doctrine to be received under penalty of anathema, but as determined by common consent on the principle that the will of the majority should prevail. Some smaller matters also were decided by the council, and 20 canons passed on various subjects pertaining to morality and religion. II. The second council of Nice, incorrectly called the seventh ecumenical, convened first in 786 by the empress Irene and her son Constantine, was dissolved, because of the tumults raised by the image-breaking party, and reassembled the following year. Three hundred and seventy-five bishops attended from Greece, Thrace, the isles of the Archipelago, Sicily, and Italy. The council was occasioned by the emperor's ill-judged severity in forbidding the use of images for any purpose, and causing them everywhere to be removed and destroyed; and by the violent opposition to his course. At a council assembled 754, in Constantinople, consisting of 338 bishops, a decree was published against the use of images. To revoke this decree was the object for which Irene summoned the second council of Nice. At the fifth session this object was accomplished by the passage of an order that images should be restored to their places, and car-

ried in procession as before. At the next session it was affirmed that the eucharist is nowhere spoken of as the *image* of our Lord's body, but as the very body itself. At the seventh session it was decided that images ought to be exposed to view in order to excite love toward the objects represented by them, and that salutation and adoration of honor ought to be paid to them, but not the worship which belongs to God alone. For a long time this council was not recognized by the French. Their chief objections to it, as contained in the Caroline books, written by order of Charlemagne, were: 1. That no western bishops, except the pope, by his legatees, were present. 2. That the decision was contrary to their custom, which was to use images, but not in any way to worship them. 3. That the council was not assembled from all parts of the church; nor was its decision in accordance with that of the Catholic church. These objections were answered by pope Adrian, but with little effect on the Gallican church.

NI'CENE CREED, a detailed statement of doctrine, which forms part of the liturgy of the Roman, Oriental, and Anglican churches, and is also received as a formulary by many of the other Protestant communions. It was drawn up principally by Hosius of Corduba, and is called by the name of the council of Nice, although nearly one-half of its present clauses formed no part of the original Nicene formulary; while, on the other hand, that document contained a series of anathemas condemnatory of specific statements of Arius, which find no place in the present so-called Nicene creed. The distinctive characteristic of the creed drawn up in the council was the word *Homoousios.* (See HOMOOUSIAN.) Its clauses correspond (except in a few verbal details) with those of the modern formulary as far as the words "I believe in the Holy Ghost;" after which follow the anathemas referred to above. The remaining clauses of the present creed, although they seem to have been in public use earlier, were formally added in the first council of Constantinople (381), with the exception of the clause, "And from the Son," which was introduced in various churches of the west in the 5th and 6th centuries; and ultimately its formal embodiment in the creed, has continued a subject of controversy with the Greeks to the present day. See GREEK CHURCH. This creed appears to have been used in the public liturgy from the latter part of the 5th century. Its position in the lithurgy varies in the different rites. In the Roman liturgy it is read on all Sundays, feasts of our Lord, of the blessed Virgin Mary, apostles' days, and all the principal festivals, but not on week-days, or the minor saints' days.

Several Arian creeds, in opposition to that of Nice, were drawn up at Sirmium and elsewhere (see LIBERIUS), but none of them met with general acceptance.

NICEPHORUS, patriarch of Constantinople, 758–828; b. Constantinople. He was the son of Theodore, imperial secretary of Constantius Copronymus. He first held high office at court. In 787 he was present as imperial commissioner at the Nicene council, where, in defense of image-worship, he opposed the iconoclasts. This zeal for image-worship he inherited from his father. Soon after his return to the capital he retired to a convent, whence, in 1863, he was called to be patriarch of Constantinople. Leo the Armenian, who became emperor in 813, passed an edict in 814 against the worship of images. But neither menaces nor entreaties could induce Nicephorus to assent to it. He became unpopular at court, and in the ensuing year was deposed, and withdrew to the convent of St. Theodore, which he himself had founded, and remained there till his death. He is sometimes called *Homologeta,* or *Confessor,* because of his vigorous opposition to the Iconoclasts, and his subsequent deposition. He published several valuable ecclesiastical works, characterized by great beauty of style. His historical productions are distinguished for accuracy, discernment, and erudition. The most important are *Breviarium Historicum,* a historical abridgement, published with a Latin translation and notes by father Petran, in Paris, in 1616; and M. Cousins has given a French translation of it in his *History of Constantinople; Chronographia Brevis,* a short chronicle of events from the beginning of the world to the author's time, with the series of kings, emperors, patriarchs, bishops, etc. It was translated into Latin, and published with notes, by father Goar, Paris. Niuphorus is numbered among the saints in both the Greek and Roman churches.

NICHE, a recess formed in a wall to contain a statue or some ornamental figure. In classical architecture, the niches are generally square recesses with canopies formed by small pediments. In Gothic architecture, the niche is one of the most frequent and characteristic features; the door-ways, buttresses, and every part of the buildings being in many instances ornamented with niches and statues in endless variety.

NICHIREN, b. at Kominato, province of Awa, Japan, 1222; the founder of one of the largest, wealthiest, and most influential sects of Japanese Buddhists, and the great revivalist of Buddhism in the 13th century. He became a profound student of those Chinese and Sanscrit texts containing the writings of Buddha's first apostles, whose richness and genuineness prof. Max Müller has recently acknowledged. After many years spent in preaching, founding temples, and making missionary tours, he died at Ikegami, near Tokio. He was several times exiled, wrote several works, still extant, and probably did more than any other man to bring all Japan under the tenets of Buddhism. His place of deccase is visited annually by thousands of pilgrims, who come on foot or by railway. The Nichirenites are the "ranters" of Buddhism; and probably the grossest form of the

modern degenerate religion of Buddha, finds its expression, among an outward show of great intellectual ability, among the disciples of Nichiren.

NICHOL, John P., LL.D., b. Scotland, 1833 ; only son of prof. John P. Nichol, late professor of astronomy ; received an education at the university of Glasgow, 1848–55. In the latter year he went to Balliol college, Oxford, where he pursued his studies until 1859 ; and in 1861 he was appointed professor of English literature in the university of Glasgow. In 1873 the degree of LL.D. was conferred upon him by the ministry of St. Andrews. He has been a successful tutor, having directed the studies of 150 candidates for Oxford ; and is popular as a lecturer, having given more than 200 addresses on miscellaneous subjects, and to classes of ladies in special branches of study, in various parts of Great Britain. During the American civil war he espoused the union cause, and, as well by its advocacy as by his Broad church doctrines, made himself a mark for hostile comment in Scotland. He has contributed to the *Westminster*, *North British*, and other reviews; is one of the writers on the *Encyclopædia Britannica ;* and has published *Fragments of Criticism*, a volume of essays (1860), *Hannibal*, a classical drama (1872), *Byron*, in the *English Men of Letters* series (1880), *American Literature, an Historical Review* (1882), *Landmarhs of English Literature* (1882), etc.

NICHOL, John Pringle, 1804–59; b. Scotland; at first a school-teacher, then a minister. His fondness for scientific studies led him to give up the ministry, and he became a popular lecturer and writer on astronomy. Among his numerous works on this subject may be mentioned *The Architecture of Heaven* (1838); *Contemplations on the Solar System* (1844); *Exposition and History of the Planet Neptune* (1848); *The Stellar Universe* (1848); *The Planetary System, its Order and Physical Structure* (1851). He published also *A Cyclopædia of the Physical Sciences* (1857). He was professor of practical astronomy at the university of Glasgow.

NICHOLAS, a co. in n.e. Kentucky, intersected by the Kentucky Central railroad; 225 sq.m.; pop. 80, 11,869—11,679 of American birth, 1750 colored. It is drained by Licking river, forming its n.e. boundary, and the South Fork as its s.w. border. Its surface is undulating, rising in the n. into considerable elevations. Blue Lick spring is celebrated for its medicinal qualities. The soil is calcareous and very fertile, producing every variety of grain, dairy products, tobacco, wool, and sorghum. It has distilleries and manufactories of flour, and lumber. Co. seat, Carlisle.

NICHOLAS, a co. in central W. Va., intersected centrally by the Ganley river forming a part of its w. boundary; about 700 sq.m.; pop. '80, 7,223—7,155 of American birth, 58 colored. It is drained by Meadow river and Buffalo creek, also Birch river in the n.e. and numerous riverlets. Its surface is diversified, much of it rising into high hills, in the n.e. is Birch mountain. Its soil is moderately fertile, producing corn, oats, wool, dairy products, and sorghum. Live stock is raised. A large proportion of the surface is covered with forests, and coal and iron are found. Co. seat, Nicholas Court House.

NICHOLAS, the name of five among the Roman pontiffs, of whom the following alone appear to call for separate notice.—Nicholas I. was born of a noble Roman family, and on the death of Benedict III., in 858, Nicholas was elected to succeed him, and was consecrated in St. Peter's church, in the presence of Ludwig II., emperor of Germany. The earliest incident of importance of his pontificate is his confiict with Photius (q.v.), who had been intruded into the see of Constantinople after the deprivation of Ignatius. Nicholas demanded from the emperor the restoration of Ignatius, as well as the withdrawal of certain attempted invasions of the jurisdiction of the west. On the refusal of his demand, Nicholas excommunicated Photius (see Greek Church), and that patriarch, in return, assembled a council at Constantinople, and retorting upon his rival the same sentence, alleged that with the translation of the seat of civil sovereignty from Rome to Constantinople the ecclesiastical supremacy was likewise transferred. The emperor Michael supporting Photius in his claim, Nicholas failed to command submission to his sentence; nor was it till the following reign, that of Basil the Macedonian, that Photius was deposed, and Ignatius restored to his see. Meanwhile, however, Nicholas had been embroiled with the emperor Ludvig. The pope had been appealed to by the unjustly divorced wife of Ludvig's younger brother, Lothaire, king of Lorraine, and had appointed legates to inquire into and report upon the case; and the legates having exceeded their powers by giving a sentence in favor of Lothaire, the pope declared their sentence null, and excommunicated them. Ludvig espoused their cause, and marched his troops to Rome, in order to enforce satisfaction. After some hostile demonstrations, the emperor, terrified, it is said, by his own sudden illness and some fatalities which befell his followers, desisted from the enterprise, and withdrew his troops. Lothaire was forced to make submission; the decree of Nicholas was enforced, and Theutberga was formally reinstated in her position as a wife and queen. Nicholas died in 868.—Nicholas V. was originally called Thomas Parentucelli. Born at Pisa in 1398, he was educated at Florence and Bologna, and having fixed his residence in the latter city, he was eventually named bishop of that see by the pope, Eugenius IV. During the troubled period of the councils of Basel and Florence, and in the difficult negotiations with the German and other churches which arose therefrom, he conducted himself with such ability and prudence, that on the death of Eugenius IV. he was chosen to succeed him on Mar. 6, 1447. At this time, the anti-pope, Felix V., still maintained

himself, although supported by a very small party; but Nicholas prevailed on him to abdicate, and thus restored the peace of the church in 1449. In the judgment of the literary world, however, the great distinction of the pontificate of Nicholas lies in the eminent service which he rendered to that revival of letters which dates from his age. The comparative repose in which he found the world at his accession, enabled him to employ, for the discovery and collection of the scattered master-pieces of ancient learning, measures which were practically beyond the resources of his predecessors. He dispatched agents to all the great centers, both of the e. and the w. to purchase or to copy every important Greek and Latin manuscript. The number collected by him was about 5,000. He enlarged and improved the Roman university. He remodelled, and may almost be said to have founded, the Vatican library. He caused translations to be made into Latin of most of the important Greek classics, sacred and profane. He invited to Rome the most eminent scholars of the world, and extended his especial patronage to those Greeks whom the troubles of the native country drove to seek a new home in the west. Alarmed by the progress of the Turkish arms in Asia, he endeavored to arouse the Christian princes of Europe to the duty of succoring their brethren of the e.; but the age of enthusiasm was past, and he was forced to look on inactively at the fall of Constantinople in 1453. This event, by forcing a large number of learned Greeks to repair to Italy and other countries of the w., contributed powerfully to that progress of learning which Nicholas had deeply at heart; but he scarcely lived to enjoy this result, having died two years later, in 1455, at the comparatively early age of 57. He must not be confounded with an anti-pope of the same name, Peter de Carborio, who was set up, in 1328, by Ludvig of Bavaria, in antagonism to John XXII. (q.v.).

NICHOLAS, Saint, a highly popular saint of the Roman Catholic church, and reverenced with still greater devotion by the Russian church, which regards him as a special patron, was one of the early bishops of Myra in Lycia. The precise date of his episcopate is a subject of much controversy. According to the popular account he was a confessor of the faith in the last persecution under Maximinian, and having survived until the council of Nice, was one of the bishops who took part in that great assembly. This, however, seems highly improbable. His name does not occur among the signatures to the decrees, nor is he mentioned along with the other distinguished confessors of the faith who were present at the council, either by the historians, or what is more important, by St. Athanasius. He may, with more probability, be referred to a later period; but he certainly lived prior to the reign of Justinian, in whose time several of the churches of Constantinople were dedicated to St. Nicholas. Of his personal history hardly anything is certainly known, and the great popularity of the devotion to him rests mainly on the traditions, both in the w. and in the e., of the many miracles wrought through his intercession. He is regarded, in Catholic countries, as the especial patron of the young, and particularly of scholars. In England, his feast was celebrated in ancient times with great solemnity in the public schools, Eton, Sarum cathedral, and elsewhere; and a curious practice founded upon this characteristic of St. Nicholas, still subsists in some countries, especially in Germany. On the vigil of his feast, which is held on Dec. 6, a person in the appearance and costume of a bishop assembles the children of a family or of a school, and distributes among them, to the good children, gilt nuts, sweetmeats, and other little presents, as the reward of good conduct; to the naughty ones, the redoubtable punishment of the "Klaubauf." The supposed relics of St. Nicholas were conveyed from the e. to Bari, in the kingdom of Naples, towards the close of the 11th c.; and it is a curious fact that in the Russian church the anniversary of this translation, May 8, is still observed as a festival.

NICHOLAS, Saint (*ante*), regarded also as the patron saint of sailors, of parish clerks, and of thieves or "knights of S. Nicholas." From the nearness in time of the saint's festal day to that of the Nativity, St. Nicholas became connected with the legends and festivities of Christmas week, and synonymous or nearly so with Santa Claus and the Dutch Kriss Kringle. By the Dutch settlers of New York St. Nicholas was regarded with special favor, and to this day his festival is annually observed with great hilarity by the St. Nicholas society of Manhattan island. *The Visit from St. Nicholas* is the title of Dr. Moore's well known song, beginning: "'Twas the night before Christmas, and all through the house, etc." In art St. Nicholas is represented as clad in episcopal robes and carrying three purses, three golden balls, or three children, referring to three different stories illustrating the saint's charity.

NICHOLAS I., more properly Nikolai Paulovitch, emperor of Russia, was the third son of Paul I., and was b. at St. Petersburg, July 7, 1796. He was very carefully educated under the eye of his mother, a princess of Würtemberg, and subsequently devoted his attention to military studies and political economy, without, however, giving evidence of any natural capacity for these subjects. He visited England and other European countries in 1816, and in the same year made a tour through the Russian provinces. On July 13, 1817, he married Frederika-Louisa-Charlotte-Wilhelmina, the eldest daughter of Frederic William III. of Prussia, and lived in domestic retirement till the death of Alexander I. (December 1825), when, owing to the resignation of his elder brother Constantine, he succeeded to the throne of Russia. A long-prepared military conspiracy broke out immediately after his accession, which he suppressed with

great vigor and cruelty. Capital punishment, which had been abolished by the empress Elizabeth, was revived, for the purpose of inflicting it upon the leaders of the insurrection. The rebels were hunted down with merciless energy, and in no case, even after the rebellion ceased to be in the least degree dangerous, was their punishment commuted. Instead of pursuing the course upon which Alexander had entered—cultivating the mind of the nation, so as to base his government upon education and intelligence—Nicholas, after a brief ebullition of reformatory zeal, reverted to the ancient policy of the czars, absolute despotism, supported by mere military power. His first great measure, the codification of Russian law, was commenced in 1827, and completed in 1846.

Soon after his accession, a war with Persia commenced, but it was concluded on Feb. 28, 1828, by the peace of Turkmanshai, which gave a considerable extent of territory to Russia. In the same year he entered upon a war with Turkey, in which victory, though at enormous cost, constantly attended his arms, and the peace of Adrianople (q. v.) obtained for Russia another increase of territory, the free navigation of the Danube, with the right of the free passage between the Black and Mediterranean seas. The political movements of 1830, in the west of Europe, were followed by a national rising of the Poles, which was suppressed after a desolating contest of nine months, in which the utmost efforts of the whole military resources of Russia were required. Nicholas punished the rebellion by converting the kingdom of Poland into a mere Russian province, and strove to extinguish the Polish nationality. This policy, however, was viewed with great dissatisfaction throughout Europe, and the vanquished Poles were everywhere regarded with general sympathy. Russia, by Nicholas's mode of government, became more and more separated from the fellowship of the western nations. Intellectual activity was, as far as possible, restrained to things merely practical, education limited to preparation for the public service, the press was placed under the strictest censorship, and every means used to bring the whole mind of the nation under official guidance. His Panslavism (q. v.) also prompted him to Russianize as much as possible all the inhabitants of the empire, and to convert Roman Catholics and Protestants to the Russian Greek Church, of which the Czar is the head. The independence of the mountaineers of the Caucasus was inconsistent with his schemes, and war was consequently waged against them with the greatest energy and perseverance, although with little success, and at the cost of immense sacrifices both of money and lives. The extension of British influence in Central Asia was also viewed by him with alarm, and was attempted to be counteracted by various means, amongst which was the expedition for the conquest of Khiva in 1839, which failed so signally (see KHIVA). Between 1844–46, he visited England, Austria, and Italy. During the political storm of 1848–49 he abstained from interference, watching, however, for an opportunity of doing so with advantage to Russian interests. The opportunity was at last found in the request of the emperor of Austria for his assistance to quell the Hungarian insurrection. This good service rendered Austria, as he thought, a faithful and firm ally. He succeeded at the same time in drawing closer the bonds of alliance between the Russian and Prussian monarchies, a proeeeding fraught with the most mischievous consequences to the latter power. The re-establishment of the French empire still further tended to confirm these alliances, and led Nicholas to think that the time had at length come for carrying into effect the hereditary Russian scheme for the absorption of Turkey; but the unexpected opposition of Britain and France, and his own invincible repugnance to give up his long-planned scheme of conquest, brought on the Crimean war, during the course of which he died at St. Petersburg, Mar. 2, 1855, of atrophy of the lungs; but his death was undoubtedly hastened by chagrin at the repeated defeats which his arms sustained, and by over-anxiety, and the excessive labor he underwent to repair his losses. He was remarkable for temperance, frugality, and patriotism, but equally so for vanity and ostentation. He was fanatically beloved by his Russian subjects, and was at the same time regarded by them with feelings of awe, a tribute to his lofty stature and imperial deportment, which gave him the most intense pleasure. This extreme vanity seems, to some extent, to have affected his mind, and to have been partly the cause of his political blundering towards the close of his reign.

NICHOLAS I., Prince of Montenegro, b. 1841; educated in Cettigue, Trieste, and at the Paris military academy, returning to Cettigue when about 20 years old. In 1860 occurred the assassination of prince Danilo the uncle of Nicholas, who was immediately proclaimed prince; and the same year married the daughter of the waywode Peter Valsetitch, by whom he has an heir, Danilo Alexander, now ten years old, and several daughters. In the first part of his reign he traveled extensively, visiting all the European countries. He introduced many reforms in education, civil administrations, and army organization. On Jan. 19, 1878, the subjects of prince Nicholas captured Dulcigno and by the Berlin treaty of the same year, Montenegro was reeognized as an independent power, the sovereignty up to that time having been claimed by the Porte. Various districts of Herzegovina and Albania were ceded to Montenegro by the same treaty. In the complications which followed both with the Albanians and with the port, Nicholas showed much political sagacity, but in the seizure of Gusinje (Oct. 1879,) his reign was disgraced by pillage and slaughter of women and children. Up to the present time the cession has not been fully carried out, though much pressure has been exercised by the other powers.

NICHOLAS, Grand Duke of Russia, b. Russia, 1831; son of Nicholas I, and brother of the late emperor, Alexander II. He entered the military service in 1847, spent a few days at Sebastopol in 1855, during the siege, and was for two years on the staff of the army in the Caucasus, where he took part in several skirmishes against the seven cherkesses. He was soon made general, and inspector-general of engineers, and commander-in-chief of the army. In the Russo-Turkish war, he was commander-in-chief of the army of the Danube, which invaded Roumania in April, 1877; he resigned in April, 1878, and was succeeded by gen. Todleben. He married, in 1856, princess Alexandra of Oldenburg, by whom he has two sons.

NICHOLAS, George, d. 1799, b. Va., son of Robert Carter, Nicholas chancery judge of Virginia, graduated in 1772 from William and Mary college, Williamsburg, Va. In the revolutionary war he was major of the 2d Va. regiment in 1777, and afterward held the rank of colonel. He was distinguished for bravery in the field, and wisdom in council, and had high reputation as statesman, and jurist. He was a member of the convention which made valid the federal constitution, and wielded a powerful influence in the house of delegates. In 1790 he removed to Kentucky, was the first attorney general of that state, and one of the original framers of its constitution April 1, 1792. He died in Lexington, Ky.

NICHOLAS, Wilson Cary, d. 1820, b. in Virginia, and was educated at William and Mary college. On the outbreak of the revolution he entered the army, became the commander of Washington's life-guard, and continued in that position until its disbandment in 1783. He was a member of the Virginia convention which ratified the U. S. constitution, was U. S. senator 1799—1805, and was elected to congress in 1807; previous to that time he was collector of the ports of Portsmouth and Norfolk. In 1814 he was elected governor of Virginia by the Jeffersonian democrats.

NICHOLLS, Francis T. See page 890.

NICHOLS, Edward Tatnall, b. Geo., 1823; entered the navy midshipman in 1836, and was made lieutenant in 1850. He commanded the steamer *Windna*, in 1862, and took part in the bombardment of forts Jackson and St. Philip, the latter of which surrendered to him April 28. The following summer, he was at the passage of the Vicksburg batteries, and fought the confederate ram *Arkansas*. In 1863 he took command of the steamer *Alabama*, in the West India squadron, and in 1864 of the *Mendota* in the blockake squadron in the n. Atlantic, fighting a confederate battery on the James river in June. He was made captain in 1866, and commodore in 1872.

NICHOLS, Ichabod, 1784–1859, b. Portsmouth, N. H.; educated at Harvard. After graduating he studied theology at Salem and was for four years a tutor in mathematics at the university. In 1809 he became associate pastor of a Portland unitarian church; in 1814 became sole pastor and remained so for more than 40 years; and in 1855 removed to Cambridge, Mass. His published works are *Natural Theology*, 1830; *Remembered Words from the sermons of the Rev. J. Nichols*, 1860, and *Hours with the Evangelists*, 1861. His doctrinal views were of the evangelical type.

NICHOLS, John, 1745–1826, b. near London; apprenticed when a boy to Wm. Bowyer, the last of the learned printers. He rapidly rose in the favor of his master, in 1766 was taken into partnership, and on the death of Bowyer, about ten years later, was at the head of the business. For the next 40 years he devoted himself to writing and printing a very large number of works (said to have been 57 as early as 1812). These were occupied mainly with literary anecdotes and antiquarian research. His first book was *Biographical and Literary Anecdotes of William Bowyer, Printer, F.S.A.* (1782), afterwards expanded into six octave volumes and called *Literary Anecdotes of the Eighteenth Century*, and supplemented by seven large octavo volumes of the same character. In these books may be found a most extensive collection of literary and biographical anecdote and of correspondence of eminent men. From 1778 until the time of his death Mr. Nichols was editor of the *Gentleman's Magazine*, where his taste for minute biographical and topographical research found full scope. He was successful as publisher and printer, though he met the great misfortune of losing his office and warehouses by fire in 1808. At his death his son John Bowyer Nichols succeeded him in his business, and continued the series of *Literary Anecdotes of the Eighteenth Century* then being published. John Gough Nichols, b. 1807, was the son of John Bowyer Nichols; was for many years previous to 1856 the editor of the *Gentleman's Magazine*, and wrote many topographical and genealogical articles, among others *The Herald and Genealogist;* d. 1873.

NICHOLS, Richard, about 1620–80; b. in England; in 1664 was appointed one of four commissioners to look into complaints made in various parts of New England and to overpower the Dutch of Manhattan. The latter surrendered in the same year and Nichols was recognized as governor of New York and New Jersey. In 1667 he returned to England, resigning the administration of New York to col. Lovelace, and that of New Jersey to Carteret.

NICHOLS, William A., 1817–69, b. Penn., educated at West Point and after graduating in 1838 was commissioned in the 2d artillery. In the Mexican war he served as aid-de-camp to Gen. Quitman and was made brevet assistant adj.gen. in 1852 with rank of captain, for his gallant services at Monterey, Churubusco and Molino del Rey. At the outbreak of the civil war he was a lieut.col., was made col. in 1864, and brevetted

brig.gen. in 1864 and maj.gen. in 1865. After the war he was made adj.gen. of the department of the Missouri.

NICHOLSON, Sir Francis, d. 1728; b. England; lieut.gov. of New York under Andros 1687–89. He was governor of Virginia 1690–92, and again 1699–1705. He was governor of Maryland 1694–99; commanded the expedition against Port Royal in 1710, and the unsuccessful expedition against Canada in 1711. He was governor of Nova Scotia 1712–17, was knighted in 1720, and was governor of South Carolina 1721–25, when he was made lieut.general.

NICHOLSON, J. W. A., b. Mass. 1821; midshipman in the navy 1838–44; became passed midshipman, and in 1852 was raised to lieutenant. In 1853–55 he accompanied the Japan expedition in the sloop *Vandalia*. During the war of the rebellion he was in actions which required great coolness and bravery in a commander. He took part in the engagement at Aquia creek, a branch of the Potomac river near Fredericksburg, Virginia. He commanded the steamer *Isaac Smith*, of the South Atlantic blockade squadron, in the battle of Hilton Head at Port Royal, Beaufort, S. C., Nov. 7, 1861, when the naval, combined with the land forces under Gen. W. T. Sherman, captured forts Warren and Beauregard. In 1862 he was promoted to commander, and in the same year was in action with the confederate flotilla on the Savannah river. At the battle of Mobile bay Aug. 5, 1864, he commanded the monitor Manhattan, attached to the w. Gulf blockade squadron, under admiral Farragut, destroying and capturing the confederate fleet in a short sharp conflict resulting in the surrender of fort Gaines; he also engaged in the bombardment of fort Morgan. In 1865–66 he commanded the steamer *Mohongo* in the Pacific squadron, and was promoted to captain in 1866. In 1867–68 he commanded the Wampanoag, and was raised to the rank of commodore in 1873.

NICHOLSON, James, 1737–1804, b. Md.; adopted a sea-faring life as did two of his brothers, who afterward rose to be captains in the navy, He participated in the capture of Havana in 1862, and in 1763 took up his residence in New York. In 1775 he was appointed captain of the *Defense*, in the American navy, and in 1776, he regained from the British several vessels which they had captured. The same year, he took command of the *Virginia*, carrying 26 guns, and the next year, he was appointed commander-in-chief of the navy, succeeding commodore Esek Hopkins, and remaining in that position till the close of the war. His vessel being prevented from going to sea by a strict blockade, he volunteered with his crew in the American army, and took part in the battle of Trenton. Soon afterward in putting out to sea, his ship ran aground and was taken, but he succeeded in escaping, and most of the crew was saved. In 1780, in command of the *Trumbull* of 38 guns, he fought for 3 hours with the British ship *Wyoming*, losing 30 men; neither ship gained a decided advantage. In 1781, off the Delaware capes, after a stubborn resistance, he was captured by the *Iris* and *General Monk*. At the close of the war, he returned to New York city, where he was appointed commissioner of loans. He was the father-in-law of Albert Gallatin.

NICHOLSON, John, British general, one of the most distinguished of the later school of Indian soldiers, was born in Dublin, Dec. 11, 1821. His father, a physician of considerable reputation in that city, died when the boy had just completed his 8th year. By his mother, a woman of strong sense and much practical piety, he was carefully educated; and from her he seems to have inherited or imbibed a certain religious gravity and earnestness of character which was early noted in him. and continued, to distinguish him through life. Through the influence of her brother, Sir James Weir Hogg, an Indian cadetship was obtained for him; at the age of 16, he arrived in Calcutta, and was soon after posted to the 21st native Bengal infantry, then stationed at Ferozepore. In 1840, his regiment was ordered to Ghizni in Afghanistan, where two years after, in the disastrous insurrection which avenged our occupation of the country, it was compelled to surrender to the enemy. After a time of miserable captivity, he regained his liberty, and joined the relieving army under gen. Pollock, to be saddened immediately after by the death, in action, of his brother Alexander. A period of inactivity ensued, during which he was stationed at Meerut, doing duty as adjt. of his regiment. On the breaking out of the Sikh war in 1845, he served in the campaign on the Sutlej, and was present at the battle of Ferozeshah, though, as attached to the commissariat department, without special opportunity of distinguishing himself. After the cessation of the war, through the recommendation of col. (afterwards sir Henry) Lawrence, Nicholson. now a lieut, was appointed assistant to the resident at the conquered capital, Lahore, and thus fairly transferred to the political branch of the service, in which most of his future time was passed. But shortly, with the outbreak of the Sikh rebellion in 1848, there came an interlude of military activity, in which he greatly distinguished himself. To Nicholson's daring and promptitude was due the preservation to us of the important fortress of Attock; and soon after, his success at the Margulla pass, in intercepting and defeating a large body of the insurgents, brought his name prominently before the world. Throughout the struggle which followed, he rendered important service; and at the great battles of Chillianwalla and Gujerat successively, he earned the special approval of lord Gough, to whom he was immediately attached.

The Punjab having finally become a British province, capt. Nicholson was appointed

a deputy-commissioner under the Lahore board, of which sir Henry Lawrence was president. He had now been nearly ten years in India; his strength was somewhat shaken by arduous service, and various illnesses which from time to time had assailed him; and above all, he was anxious to visit and console his widowed mother, then prostrated by the death in India, by an accident, of William, his younger brother. In 1850, accordingly, he took his furlough, and returned home, taking Constantinople *en route*, and visiting, with an eye to professional instruction, the capitals of all the great military powers of the continent. On his return to India, he was again appointed by Lawrence a deputy-commissioner in the Punjab, and for five years subsequently his work lay among the savage tribes of the frontier. His success in bringing them under thorough subjection to law and order, was something marvellous; and such were the impressions of fear and reverence wrought by the force and massive personalty of the man, that he became among these rude populations, under the title of "Nikkul Seyn," the object of a curious kind of hero-worship. So far was this carried, that a sect actually arose, of Nikkul-Seynees, who consecrated him as their Guru (or spiritual guide), and persisted—despite of severe floggings regularly inflicted by the worthy man, indisposed to accept divine honors—in falling at his feet, and making him an object of express adoration.

With the outbreak of the great mutiny in 1857 came Nicholson's supreme opportunity, and the brief career of glorious achievements in which he developed in the eye of the world the full power and splendor of his military genius. In the saving of the Punjab, virtually India was saved to us; and under sir John Lawrence, who had succeded his brother, sir Henry, Nicholson—though not without noble coadjutors to divide with him the honor—perhaps did more than any other single man to hold firm our grasp of the Punjab. He it was who suggested the formation of the famous movable column, by which mainly the work was done, and presided over its organization. Shortly, he was appointed to command it; and in his dealings with the suspected regiments of sepoys, he exhibited a particular combination of boldness with subtlety, discretion, and astuteness, scarcely too much to be admired. At Trimmu Ghaut, on the 12th and 14th of July, he brought to bay, and nearly utterly annihilated, a large force of the declared rebels. Things thus made safe behind him, he marched to re-enforce the army of gen. Wilson, engaged in the siege of Delhi, arriving in camp on Aug. 7. His presence and counsels gave new impulse to the operations; and in every way he strove, with fiery and impatient energy, to expedite the delayed assault. A strong body of the enemy having tried to make their way into the British rear, to Nicholson was assigned the task of intercepting and bringing them to battle. This he achieved on Aug. 24, near Nujuffghur—under circumstances of extreme difficulty, in the most masterly manner surmounted—obtaining a most brilliant result in the complete ruin and dispersion of the mutineers. When the assault on the city was at last ordered, gen. Nicholson (for to this rank he had now attained) was selected for the post of honor; and on the morning of Sept. 14, he led the first column of attack. After the troops had forced their way into the city, an unforseen check occurred, and Nicholson, ever in front, exposed himself in the most fearless manner to animate his men to advance. Conspicuous by his towering stature, he became the mark of the enemy's bullets, and fell, shot through the body. He lingered for some time in great suffering, and died on the morning of the 23d. Over the whole of India, the victory was saddened by his death; for it was felt that in John Nicholson, to use lord Canning's expression, "a tower of strength" had fallen. During the whole war of the mutiny, though it claimed many noble victims, there fell no man more regretted in his death than Nicholson, or in his death more worthy of regret. Throughout his career, he shone—as opportunity offered—a veritable "king of men;" one of those born to command, who naturally and inevitably rise to it, and however great in achievement, seem to need only the hap of ampler opportunity in the future, to outsoar their great achievements in the past. No one ever seems to have come fairly in contact with him without being strangely impressed with this sense of a magnificent reserve of *power* in him. It remains only to add, that his nature was on the one side as gentle, tender, and affectionate, as on the other it was strong and brave: and that, by all who had intimate relations with him, he was not less beloved for his mild virtues, than for his sterner gifts honored and admired. To his memory all honor was paid. The queen commanded it to be officially announced that, had he lived, he would have been created a knight commander of the bath; and by the East India company, a special grant of £500 a year was voted to the mother who survived to mourn for him.—For further details of the life of this man of right noble and heroic mold, the reader is referred to the account of him—from which this little sketch is redacted—given in Kaye's most interesting work entitled *Lives of Indian Officers* (2 vols., Lond., A. Strahan & Co., 1867).

NICHOLSON, John B., 1783–1846; b. Va., joined the U. S. navy as midshipman in 1800. In 1812 he was promoted to lieut., and on the breaking out of the war with England was ordered on board the *United States*, serving as 4th lieut. He was present at the engagement which terminated in the capture of the *Macedonian*, and was 1st lieut. of the *Peacock*, bringing in the prize ship *Epervier*. In 1828 he was promoted capt., and afterward to the rank of commodore.

NICHOLSON, Samuel, 1743–1811; b. Md.; brother of James. He was lieut. under Paul Jones in the *Bon Homme Richard*, and took part in the fight between her and the

Serapis. He was promoted to a captaincy in 1779, and in 1782 commanded the frigate *Dean,* of 32 guns, and made a long cruise, during which he captured a number of prizes, including 3 sloops-of-war. He retained the rank of capt. after the reorganization of the navy, and was the first commander of the frigate *Constitution.* At the time of his death he was the senior officer in the service.

NICHOLSON, WILLIAM CARMICHAEL, 1800–72: b. Md., entered the navy in 1812. He was attached to the *President,* under Decatur, and took part in the engagement off Long Island, in Jan., 1815, which resulted in her capture by a British squodron. He was made lieut. in 1821, and commander in 1841. He commanded the sloop *Preble* in the Mediterranean squadron in 1843, and the schooner *Boxer* in the Pacific squadron in 1850. He was appointed fleet-capt. of the Pacific squadron in 1855, and commanded the steam-frigate *Mississippi* in the East India squadron 1858–60. He was stationed at the naval asylum in Philadelphia at the beginning of the rebellion, and soon afterwards was placed in command of the steam-frigate *Roanoke.* He became commodore in 1862, and was retired in 1864.

NICHOLSON, WILLIAM RUFUS, D.D. See page 890.

NIC'IAS, a famous Athenian statesman and gen. during the Peloponnesian war, was the son of Niceratus, a very wealthy citizen, who had acquired his fortune by working the silver-mines at Laureium. Nicias belonged to the aristocratic party, and after the death of Pericles presented himself as the opponent of Cleon, the great popular or demagogic leader. He was not a man of quick, brilliant, audacious genius, like Alcibiades; on the contrary, he was remarkably wary and cautious, even at times to timidity. Success generally accompanied his enterprises against the Spartans and their allies. In 427 B.C., he captured the island of Minoa; next year he ravaged the island of Melos and the coasts of Locris; the year following that he obliged the Spartan force in Sphacteria to surrender, and also defeated the Corinthians. In 424 B.C. he made havoc of part of Laconia, captured the island of Cythera, and achieved several other successes. After the death of Cleon he brought about a peace between the Spartans and Athenians, 421 B.C. Six years afterwards the Athenians, at the instigation of Alcibiades, resolved on a great naval expedition against Sicily. Nicias was appointed one of the commanders, although he had strongly protested against the undertaking. In the autumn of 415 B.C. he laid siege to Syracuse, and was at first successful, but subsequently experienced a series of disasters; his fleet was destroyed, and his troops began a retreat towards the interior of Sicily. They were speedily forced to surrender, and Nicias was put to death 414 B.C. See Thirlwall's and Grote's *Histories of Greece,* and Plutarch's *Life of Nicias.*

NICKEL (symbol, Ni; equiv. 29·5— new system, 59—sp. gr. 8.8) is a grayish-white glistening metal, capable of receiving a high polish, of about the same hardness as iron, and, like that metal, malleable and ductile. It has about the same fusibility as wrought iron, but is less readily oxidized than that metal, since it remains unchanged for a long time in a moist atmosphere, and is very little attacked by dilute acids. It is strongly magnetic, but loses this property when heated to 600°. It dissolves in hydrochloric and dilute sulphuric acid with a development of hydrogen gas, and is very readily oxidized in nitric acid.

Nickel only occurs in the native state in meteoric stones, in which it is always present in association with the iron which forms the principal part of those masses. It is found in tolerable abundance in Saxony, Westphalia, Hungary, Sweden, etc., where it occurs in the form of *kupfernickel* (so called from its yellowish-red color), which is a combination of nickel and arsenic. The metal is obtained on the large scale for the purpose of making German silver (q.v.) and other alloys, either from this compound or *speiss,* which is an impure arsenio-sulphide of nickel, formed during the manufacture of *smalt* (q.v.), by somewhat complicated chemical processes. In small quantities it may be obtained by reducing one of its oxides by means of hydrogen at a high temperature, or by exposing the oxalate to a very high temperature in a crucible lined with charcoal.

Nickel forms two compounds with oxygen—viz., a protoxide, NiO, and a sesquioxide, Ni_2O_3, which is not basic, and may be passed over without further notice. The *protoxide* occurs as a greenish-gray powder, which exhibits no magnetic properties, and is insoluble in water. It is obtained by heating the carbonate or the *hydrated protoxide* in a closed crucible. The hydrated protoxide, NiO,HO, is obtained by precipitation from a solution of one of its salts by potash. The salts of the protoxide and their solutions are of a delicate, very characteristic green color; but in the anhydrous state most of them are yellow. The neutral salts, soluble in water, slightly redden litmus, have a sweetish, astringent, metallic taste, and when administered in moderate doses excite vomiting. The most important of the salts is the sulphate (NiO,SO_3+7 Aq), which crystallizes in beautiful green rhombic prisms. It is obtained by dissolving the metal or its oxide in dilute sulphuric acid; and is the source from which the other salts of nickel, the carbonate, oxalate, etc., are obtained. The principal use of nickel is in the composition of various alloys, such as German silver (q.v.).

The sulphate of nickel has been prescribed successfully by professor Simpson in cases of severe headache.

NICKEL (*ante*). Nickel has three sulphides, or sulphurets, a subsulphide, Ni_2S, which is formed by reducing the sulphate with charcoal or hydrogen; the protosulphide, NiS, formed by fusing sulphur and nickel, and also found native in the mineral

millerito; and the disulphide NiS_2, obtained by heating the carbonates of nickel and potash with sulphur to redness. An anhydrous carbonate $NiCO_3$, is made by heating chloride of nickel with carbonate of potash or soda in a sealed tube. It crystallizes in minute rhombohedrons. A hydrocarbonate, $NiCO_3$, 2 Ni $(H_2O)_3$, also exists as a native mineral, called emerald nickel, and found in mines in the form of incrustations and short stalactites; sometimes massive; pearly luster, emerald-green color, transparent, translucent; hardness 3 to 3.25; sp. gr. 2.57 to 2.69. Occurring in Lancaster co., Penn., associated with serpentine, and also in the Shetland islands. The nitrate $Ni,2NO_3,6H_2O$ crystallizes in 8-sided emerald-green prisms, soluble in twice their weight of cold water. It is made by dissolving the metal in nitric acid. Sulphate of nickel, $NiSO_4 7H_2O$ crystallizes in green rhombic prisms, soluble in 3 parts of cold water. It is made by the action of dilute sulphuric acid on the metal. When these crystals are exposed to the light they subdivide, without falling apart, into minute regular octahedrons. If the crystallization takes place between 59° and 77° F. it will be octahedral, and instead of 7, there will be only 6 molecules of water. The methods of smelting and working nickel ores are complicated, and some of them are not generally known. The uses of nickel until recently were principally for forming alloys with other metals. In some countries besides the United States, coins of small value have been made of an alloy of nickel, zinc, and copper. The U. S. cent, authorized by the act of Feb. 21, 1857, was composed of 88 per cent of copper and 12 per cent of nickel. The metal is used in the preparation of the alloy called German silver, which contains 2 parts of copper and 1 of zinc and nickel each. White copper, or *pakfong*, of China, consists of copper, 40.4; nickel, 31.6; zinc, 25.4; iron, 2.6. Recently nickel has been used for plating other metals, and this use has made it one of the most valuable of metals. Chemists had for some time known that a brilliant deposit of nickel could be obtained by electrolysis from solutions of nickel salts, but no advantage was taken of this knowledge till Mr. Isaac Adams of Boston devised a method of rendering nickel-plating practicable and profitable. He employs a double chloride of nickel and ammonium, or of sulphate of nickel and ammonium. See *Electrolysis*, *Electro-Metallurgy*, and *Electrotype*, in art. GALVANISM, *ante*. It is important to have the salt which is used in the process perfectly pure, and it must therefore be made from pure nickel. Mr. Adams found that it was not practical to use a plate of pure metal as the *anode*, because it would not dissolve sufficiently fast to satisfy the demands of the solution (the deposit of metal on the *cathode*, and consequently its separation from the salt, being the greater). This was remedied by combining the nickel *anode* with carbon, forming a carbide. This causes the metal to dissolve exactly as fast as it is deposited. Since 1880, large pieces of malleable nickel have been manufactured.

NI'COBAR ISLANDS, a group of islands in the Indian ocean, n.w. of Sumatra, and forming, with the Andamans (q.v.), an extension of the great island chain of which Java and Sumatra are the principal links. Lat. 6° 40′ to 9° 20′ N., long. 93° to 94° east. They are divided by the Sombrero channel into two groups, of which the principal members are the Great Nicobar (area 260 sq.m.), and the little Nicobar (area 86 sq.m.). The inhabitants, who are not numerous, are distinct from Malays and Burmese, and are said to resemble the hill-tribes in Formosa. The Danes made a settlement here in 1754, were dispossessed by Great Britain from 1807 to 1814, and finally withdrew in 1848. In 1869, the Indian government took possession of these islands, and affiliated the new settlement at Nancowry harbor to the great penal colony at Port Blair in the Andaman islands. The soil is fertile, and the cocoa-nut palm grows abundantly.

NIC'ODEMUS, a Pharisee, member of the Jewish sanhedrim, or great council of the nation, who, impressed by what he had heard of Jesus, and perhaps convinced that he was the Messiah, came by night for fuller private converse. He may have come in secret through fear or prudence; he may have found it impossible to meet Christ alone without interruption in the day time. He received memorable instruction, (John iii.) He appears in two scenes afterwards—the first, when at the sitting of the great council he ventured in a few words to defend Jesus against the unjust suspicions of the Jews; the second, when he united with his colleague Joseph of Arimathea in rendering the last honors to the crucified Jesus. Scripture gives no other information of him Tradition relates that having declared himself a follower of Christ, and been baptized by Peter, he was removed from his office and expelled from Jerusalem; that he found refuge in a country-house of Gamaliel his cousin, with whom he remained until his death. The so-called *Gospel of Nicodemus* or *Acts of Pilate* is undoubtedly spurious, and of no value.

NICOL, HENRY, 1846–81, b. England; completed what education he received at school before he was seventeen, being then obliged to take a clerkship in a merchant's office, and which he continued to hold until failing health necessitated his relinquishing it a year before his death. He devoted his leisure from business to the study of philology, and with such success that he eventually gained a European reputation for his wide range of knowledge in that department of research. He particularly attached himself to the study of old French; and concerning this *The Academy* said at the time of his death: "England has lost its first romance and old-French scholar, and one of its foremost English and general philologists."

NICOLAI, CHRISTOPH FRIEDR., a celebrated German author, bookseller, and publisher, was b. Mar. 18, 1733, at Berlin, where his father was also a bookseller. He

devoted himself very earnestly to literary and philosophical studies, and early distinguished himself by his *Briefe über den jetzigen Zustand der schönen Wissenschaften* (Berl. 1756), in which he exposed the errors of both Gottsched and Bodmer, then carrying on a controversy which was agitating the literary world of Germany. He became the associate of Lessing and Moses Mendelssohn. Jointly with the latter he edited for some time the admirable *Bibliothek der schönen Wissenschaften* (Leip. 1757–58); and with Lessing, he gave to the world *Briefe, die neueste deutsche Literatur betreffend* (24 vols. Berl. 1759–65). By this he was led to conceive the plan of the *Allgemeine deutsche Bibliothek* (106 vols. 1765–92), a periodical which he edited for many years, and which contributed much, particularly in the early period of its existence, to the progress of literature and improvement of taste in Germany, but was too frequently characterized by an undue acerbity of tone. Nicolai's hostility to the new schools of literature and philosophy, which sprang up in Germany, exposed him to attacks from the pens of Herder, Goethe, Schiller, Lavater, and Fichte. His death took place Jan. 8, 1811.

Among Nicolai's works may be mentioned his *Topographisch-historische Beschreibung von Berlin und Potsdam* (Berl. 1769, 3d edit. 1786); *Characteristischen Anecdoten von Friedrich II.* (Berl. 1788–92), both of permanent value; some novels, as his *Leben und Meinungen des Magisters Sebaldus Nothanker* (4th edit. Berl. 1799); *Geschichte eines dicken Mannes*, a sharply satirical performance (2 vols. Berl. 1794); *Beschreibung einer Reise durch Deutschland und die Schweiz* (Berl. 1781; 3d. edit. 12 vols. 1788–96); an autobiography, published in the *Bildnisse jetzt lebender Berliner Gelehrten;* and a work entitled *Ueber meine gelehrte Bildung, über meine Kenntniss der Critischen Philosophie und meine Schriften dieselbe betreffend* (Berl. 1799).

NICOLAI, Otto, a German musical composer of note, b. at Königsberg in 1809. His early life was a struggle with poverty and difficulties. He studied for three years in Berlin under Klein; and in 1835 went to Rome, where he went through three more years of study under Baini. After traveling for ten or twelve years over Europe, he became, in 1847, Kapellmeister at Berlin, a post which he soon resigned. He appeared as a composer of dramatic music as early as 1831; but his first work of importance was *Il Templario*, founded on Scott's romance of *Ivanhoe*, which, produced at Turin in 1841, attained a high and permanent reputation. In 1848 he wrote at Berlin *Die Lustigen Weiber von Windsor*, on which his renown as a musician is founded, a work charming for its clear design and lively vigorous tone, whose overture is almost worthy of Weber. Two months after the production of this his *chef-d'œuvre*, its composer died at Berlin.

NICOLAITANS, a class of persons, spoken of Rev. ii. as found in the churches of Ephesus and Pergamos, whose doctrine and deeds were hateful to Christ. Irenæus, who wrote near the close of the 2d c., and is the earliest author who mentions them, says that they were followers of Nicolas of Antioch, one of the seven deacons chosen at Jerusalem. As there was a traitor among the "twelve," there may have been an immoral man among the "seven;" but in the absence of all contemporary evidence a statement made a hundred years after the writing of the Revelation has no force against the presumptive evidence that a man who was one of seven selected from the whole church of Jerusalem as of "tested character, full of the Holy Ghost, and of wisdom," did not afterwards become notorious as a teacher and perpetrator of abominable crime. As to the particular character of the offenses taught and practiced by these persons, many vain conjectures have been made. The ingenious suggestion of Michaelis is not improbable, that those thus condemned by Christ were of similar character with "the followers in the way of Balaam;" described by Peter in his second epistle; and that *Nicolaitans* is simply the Greek translation of the Hebrew "*Balaam*," both signifying *conquerors* or *masters of the people.* This theory is supported by the fact that in the Revelation, while the church of Pergamos is censured for tolerating within it persons who held the doctrine of Balaam, after the special character of the crimes he had taught Israel to commit has been described, it is added "*even so* thou also hast those who hold the doctrine of the Nicolaitans."

NICOLAS, Nicholas Harris, 1799–1848; b. England; entered the navy as a midshipman in 1808, and after some years of active service was promoted to the rank of lieut. Shortly afterwards, however, he retired from the service and devoted himself to the study of English law and antiquarian literature, and in 1825 was called to the bar. He soon distinguished himself as a peerage lawyer and a writer on antiquarian subjects. In 1826 he became joint editor of *The Retrospective Review;* and in 1831 he was made a knight of the Hanoverian Guelphic order. Among his numerous works, those which are best known are, *Synopsis of the Peerage of England* (1825); *Testamenta Vetusta* (1826); *Chronology of History* (1835); *History of the Battle of Agincourt; Dispatches and Letters of Lord Nelson* (1844); and *Memoirs of Sir Christopher Hatton* (1847).

NICOLE, Pierre, 1625–95, b. Chartres, France; at an early age attained unusual proficiency in philosophy and classical studies, and when but fourteen began at Paris a course of philosophical and theological study. Here he came much under the influence of Anthony Arnauld (q.v.), and was deterred from taking orders by his views on the Jansenist discussion and his dislike of the Jesuit power. He attached himself to the recluses (*solitaires*) of Port Royal (q.v.) at Les Granges, and became an instructor in the Jansenist schools, while continuing the study of theology at the Sorbonne. From this

time he devoted his pen to extending and expounding the doctrines of Jansenism, though he did not fully agree with the extreme advocates of that system. The number of his moral, religious, and controversial treatises is large, all characterized by purity of style, subtilty of discrimination, and a broad and generous humanity. To him more than any other writer is the Port Royal logic (*La Logique, ou l'art de Penser*, 1668) to be attributed. Others of his works are: *Perpétuité de la Foi; Les Visionnaires; Essais de Morale*, in 6 volumes, 2 published posthumously; his philosophical reputation rests mainly on the essays and logic. Personally, he was a man of great humility and modesty, and was so far from seeking public applause that in more than one instance he did not deny the belief that a work of his own was written by others of the Port Royal brotherhood. He labored incessantly in his chosen work till, worn out by the controversy which was so little suited to his natural disposition, in 1693 he was compelled by increasing illness to desist, and 2 years afterwards was followed to his grave by the most distinguished men of his time.

NICOLET, a co. in s. Quebec, having the St. Lawrence river for its n. and n.w. boundary, drained by the Becancour river, the Nicolet and West Branch, which form part of its s.w. border; 595 sq.m.; pop. '81, 26,611. It is traversed by the Three Rivers division of the Grand Trunk railway. It has several flour and saw mills, boot and shoe factories, and an extensive trade in lumber. Its soil is fertile along the rivers, and its surface is covered with immense forests, diversified with plains adapted to the cultivation of grain. Co. seat, Becancour.

NICOLLET, a co. in s. Minnesota, having the Minnesota river for its e., s., and w. boundary; 470 sq.m.; pop. 12,344—7,153 of American birth, 1 colored. It is intersected by the Winona and St. Peter, and the St. Paul and Sioux City railroads, forming a junction at St. Peter. It is drained by numerous lakes, the largest, Swan lake, nearly 9 m. long. Its surface is extensively covered with forests, but a large proportion stretches out into broad prairies. The foundation of the soil in some portions is silurian limestone. Its products are grain, potatoes, wool, sorghum, the products of the dairy, and live stock. Its leading industries are the manufacture of brick, furniture, leather, and flour. Co. seat, St. Peter.

NICOLLET, Jean Nicolas, 1786–1843. b. France; studied under Laplace, and in 1817 was appointed librarian of the Paris observatory. In 1802 he came to this country on a scientific expedition, and explored the territory drained by the Missouri, Arkansas, and Red rivers, and the upper Mississippi. He obtained much valuable information on the natural history of the districts which he visited, and on the languages and customs of the Indian tribes. Soon after his return he was sent, with John C. Fremont, to the western territories, to make a general report of their resources and draw up a map of them. He published *Mémoire sur la mesure d'un arc de parallèle moyen entre le pôle et l'equateur;* and *Lettre sur lés assurances qui ont pour base les probabilités de la durée de la vie humaine.*

NICOMACHUS, a Greek painter in the 4th c. B.C., a son and scholar of Aristodemus. Little is known of his life. Plutarch compares his paintings to the poems of Homer, and Cicero ranks him with Protogenes and Apelles. Pliny notices the following of his works: *The Rape of Proserpine*, in the temple of Minerva, on the capitol; *Victory riding in a four-horse chariot*, also in the capitol; *Apollo and Diana*, *Cybele on a Lion*, *Female Bacchanals*, and *Scylla*. He was celebrated for the swiftness with which he executed. Among his scholars were several great painters, such as his brother Aristides, his son Aristocles, Philoxenus of Eretora, Nicophanes, and Corybar

NICOME'DEIA, the capital of ancient Bithynia, was situated at the north-eastern angle of the gulf of Astacus, in the Propontis, now called the bay of Ismid; was built about 264 A.D. by Nicomedes I., who made it the capital of his kingdom, and it soon became one of the most magnificent and flourishing cities in the world, and some of the later Roman emperors, such as Diocletian and Constantine the great, selected it for their temporary residence. It suffered greatly both from earthquakes and the attacks of the Goths. Constantine died at a royal villa in the immediate vicinity. Hannibal committed suicide in a castle close by. It was the birthplace of the historian Arrian. The small town of Ismid or Isnikmid now occupies its site, and contains many relics of ancient Nicomedeia.

NICOP'OLIS, recently a Turkish fortress, but since 1878 a city of the newly-constituted principality of Bulgaria, is on the Danube, about 56 m. w. of Rustchuk. The fortifications, though extensive, were never of much importance, and the Berlin congress of 1878 provided for their demolition. The city used to be divided into two portions: the fortress and Turkish town, defended on every side by batteries and ramparts, and the eastern quarter, comprising the dwellings of the Bulgarians, Wallachs, and Jews. Nicopolis is widely built, most of the houses being surrounded by gardens. It is an important market for Wallachian wares, but otherwise is not a great center of trade. Wine is produced in the vicinity. Pop. 16,000.

Nicopolis, the ancient *Nicopolis ad Istrum*, was founded by Trajan, and fragments of the old wall still remain. Here the Hungarians, under their king Sigismund, were defeated by the sultan Bajazet I. in 1396. The city gives title to a Greek archbishop and to a Catholic bishop

NICOPOLIS in Epirus, one of the many cities bearing the same name—"city of victory"—founded by Augustus to commemorate his victory over Antony in the battle of Actium; immediately after which he inclosed and dedicated to Neptune the space where his tent had been pitched, on a height which commanded a view of both the land and sea forces. Here he afterward built the city, and made it a Roman colony. "Some of the finest parts," Josephus says, "were the work of Herod, who was one of the greatest builders of his day." His connection with it, added to the well-known wide diffusion of the Jews into all the principal countries and cities, renders it probable that many of them lived there. Paul, in his letter to Titus, announced his purpose to pass the winter at Nicopolis; the subscription to the epistle asserts that Paul wrote it at Nicopolis of Macedonia, implying that it was there that he intended to pass the winter. But his language shows that he had not yet gone to Nicopolis, and the subscription to the epistle has no authority. Jerome's opinion is generally adopted, that it was the Augustan Nicopolis to which Paul referred. Its situation was convenient, as a central point, in some of his journeys east and north. He had, long before, preached at Illyricum, and one of his last official acts was to send Titus—probably after he had joined him at Nicopolis—on a mission to Dalmatia. Possibly he was arrested at Nicopolis soon afterward, and taken finally to Rome. At this time the city, though only about 30 years old, had become the chief place in western Greece. As it owed its origin and importance to war, so it was destroyed by hostile armies. Julian, finding it in ruins, rebuilt it. Again destroyed by the Goths, Justinian restored it a second time. During the middle ages a new city was built at the point of the promontory, and the "city of victory" was deserted. The ruins, covering a large portion of the isthmus, still show its original grandeur and size. Wordsworth thus speaks of them: "A lofty wall spans a desolate plain; to the north of it rises, on a distant hill, the shattered stage of a theater; and to the west, the extended though broken line of an aqueduct connects the distant mountains with the main subject of the picture—the city itself." There are also ruins of a mediæval castle and other buildings on the low, marshy, and now desolate plain.

NICOSI'A, a city of Sicily, in the province of Catania, 70 m. s.w. from Messina. It is situated on the crest of a steep, conical hill between two head-branches of the Salso. It has scarcely any manufactures, but carries on some trade in corn, wine, oil, and cattle. Near it are beds of alum, schist, a rich mine of rock-salt, and springs of petroleum. Pop, 14,250.

NICOSIA. See LEFKOSIA, *ante*.

NICOT, JEAN, 1530–1600, b. France; a diplomatist appointed by Francis II. ambassador to Portugal. During his residence at Lisbon he obtained, from a Flemish trader, some seeds of the tobacco plant from Florida. Nicot subsequently introduced tobacco into France, and it was called, in his honor, *Nicotiana*. He wrote a treatise on navigation, and *Treasury of the French Language*, one of the earliest French dictionaries.

NICOTIA'NA. See TOBACCO.

NI'COTINE, or NICOTY'LIA ($C_{20}H_{14}N_2$), is one of the natural volatile oily bases destitute of oxygen, and constitutes the active principle of the tobacco plant, in the leaves, roots, and seeds of which it occurs in combination with malic and citric acids. It is likewise contained in the smoke of the burning leaves. It is a colorless, intensely poisonous liquid, of specific gravity 1.027 at 66°, which boils at 480°, evolves a very irritating odor of tobacco, especially on the application of heat, is very inflammable, and burns with a smoky flame. It is moderately soluble in water, and dissolves readily in alcohol and ether. If exposed to the air, it absorbs oxygen, and becomes brown, and ultimately solid. The quantity of nicotine contained in tobacco varies from 2 to 8 per cent; the coarser kinds containing the larger quantity, while the best Havana cigars seldom contain more than 2 per cent, and often less.

A remarkable case of poisoning by nicotine—that of the count Bocarmè, who was tried and executed in Belgium for the murder of his brother-in-law—is recorded in the *Annales d'Hygiène* 1851, and was the occasion of Orfila's publishing his *Mémoire sur la Nicotine*. A distinguished student of the college of chemistry subsequently employed it for the purpose of suicide. The deaths that have taken place from the use of tobacco in the form of injection—of which several cases are on record—were doubtless due to the action of this substance.

NICO'YA, GULF OF, opens into the Pacific ocean from n.w. Costa Rica, lying between the main land and the peninsula of Nicoya, which terminates in cape Blanco; this cape being situated at the w. side of the gulf of Nicoya, at its mouth, and cape Herradura on the east. It is about 55 m. long, lying n. and s., and 30 m. wide at its mouth. Punta Arenas, the sole port of entry on the Pacific side of Costa Rica, is situated on the e. side of the gulf. In it are a number of small islands among which are San Lucar, Bejuca, Chira, and Venado. Several streams empty into it, the chief of which are the Tempisque, Rio Grande, and Nicoya rivers.

NIEBUHR, BARTHOLD GEORG, one of the most acute historians, critics, and philologists of modern times, was b. Aug. 27, 1776, at Copenhagen, where his father, Karsten Niebuhr (q.v.), then resided. The aptitude for learning which Niebuhr displayed, almost from infancy, led him to be regarded as a juvenile prodigy, and unlike many

other precocious children, his powers of acquiring knowledge kept pace with his advancing years. After a carefully conducted preliminary education, under the superintendence of his father, he spent a session at Göttingen studying law, and from thence proceeded in his 19th year to Edinburgh, where he devoted himself more especially to the natural sciences. On his return to Denmark, he became private secretary to the finance minister, Schimmelmann, and from that period till 1804 held several appointments under the Danish government, which, however, he was led to resign in consequence of his strongly pronounced political tendencies, which made him enter heart and soul into the feeling of hatred of Napoleon, which was at that time agitating the minds of Germans. In accordance with these views, Niebuhr entered the Prussian civil service in 1806, and during the three succeeding years he shared in the vicissitudes which befell the government of his chief, count Hardenberg, after the disastrous battle of Jena, and the consequent pressure of the Napoleonic influence on the management of the state. The opening of the university of Berlin in 1810 was a new era in the life of Niebuhr, who, with a view of promoting the interests of the new institution, gave a course of lectures on Roman history, which, by making known the results of the new and critical theory which he had applied to the elucidation of obscure historical evidence, established his position as one of the most original and philosophical of modern historians. His appointment, in 1816, to the post of Prussian ambassador at the papal court, where he remained till 1823, gave him an opportunity of testing on the spot the accuracy of his conjectures in regard to many questions of local and social bearing. On his return from Rome, Niebuhr took up his residence at Bonn, where, by his admirable lectures and expositions, he contributed very materially to the development of classical and archæological learning. He was thus employed when the revolution of 1830 roused him from the calm of his literary pursuits. Niebuhr's sensitive nature, unstrung by physical debility, led him to take an exaggerated view of the consequences of this movement, and to anticipate a recurrence of all the horrors of the former French revolution, and the result was to bring about a state of mental depression and bodily prostration, which ended in his death in January, 1831. Niebuhr's attainments embraced a more extensive range than most men are capable of grasping, for he was alike distinguished as a shrewd man of business, an able diplomatist, an accurate scholar, and a man of original genius. He had mastered 20 languages before the age of 30, while the mass of facts which his tenacious memory retained, and the intuitive sagacity that enabled him to sift true from false historic evidence, and often to supply by felicitous conjecture the link wanting in some imperfect chain of evidence, exhibit the extraordinary scope of his intellect. It is not to be denied, however, that he is often arbitrary and unhistorical in his conjectures, and the stricter sort of skeptical critics, like the late sir George Cornewall Lewis, even go so far as to regard his effort to construct a continuous Roman history out of such legendary materials as we possess as, on the whole, a failure. Among the many important works with which he enriched the literature of his time, the following are some of the most noteworthy: *Römische Geschichte* (3 Bde. Berl. 1811–32; 2d edit. 1827–42; 1833; 1853), the first two volumes have been translated by J. C. Hare and C. Thirlwall, and the third by Dr. W. Smith and Dr. L. Schmitz; *Grundzüge für die Verfassung Niederlands* (Berl. 1832); *Griech. Heroengeschichte* (Hamb. 1842), written for his son Marcus; the *Kleinen historischen und philologischen Schriften* (2 Bde. Bonn, 1828–43), contain his introductory lectures on Roman history, and many of the essays which had appeared in the transactions of the Berlin academy. Besides these, and numerous other essays on philological, historical, and archæological questions, Niebuhr co-operated with Bekker and other learned annotators in re-editing *Scriptores historiæ Byzantinæ;* he also discovered hitherto unprinted fragments of classical authors, as, for instance, of Cicero's *Orations* and portions of Gaius, published the *Inscriptiones Nubienses* (Rome, 1821), and was a constant contributor to the literary journals of Germany. See Miss Winkworth's *Life and Letters of Niebuhr* (3 vols., 1852); Classen's *Niebuhr* (1876).

NIEBUHR, Karsten, a distinguished geoprapher and traveler, was b. in 1733, in the Hanoverian territory of Hadeln, on the confines of Holstein. Being early thrown on his own resources, he spent several years of his youth in the position of a day-laborer; but his natural energy having led him to apply himself to the study of geometry, and having acquired a small property, he went to Göttingen, where he attended the classes at the university until his resources were wholly exhausted. At this period he entered the Danish service, and in 1761 he joined the scientific expedition which king Frederick V. sent to explore certain portions of Arabia, with a view of illustrating some passages of the Old Testament. The expedition reached Cairo at the close of the year 1761, and after having carefully explored the pyramids, and crossed the desert to mount Sinai and Suez, proceeded to Arabia Felix. Here, however, the various members of the expedition, which included the eminent naturalist Forskäl, all perished with the exception of Niebuhr, who had himself suffered severely from fever. After the untimely death of his companions, he adopted the diet and dress of the natives—a measure to which he was probably indebted for the good health which he enjoyed during the rest of the travels, which he prosecuted with extraordinary resolution for more than six years. He proceeded as far as India, visiting also Persia and Asiatic Turkey, and continued the observations and researches of his late colleagues in addition to his own special geographical

investigations. On his return to Denmark, in 1767, Niebuhr at once devoted himself to the task of publishing the results of his important mission, which appeared in German under the following titles, *Beschreibung von Arabien* (Copenh. 1772), and *Reisebeschreibung von Arabien und andern umliegenden Ländern* (Copenh. 1774–78, 2 vols.); the publication of the third volume of this work was unfortunately delayed, in consequence of the pressure of numerous other engagements arising from his professional and official duties, and it was not till more than 20 years after his death that the book made its appearance under the supervision of Niebuhr's daughter, and through the liberality of the eminent bookseller Perthes of Hamburg. In addition to these valuable observations, Niebuhr edited and published at his own cost the natural-history notes of his deceased friend and fellow-traveler, P. Förskäl, which he arranged in two works, *Descriptiones Animalium*, etc. (Copenh. 1775), and *Flora Ægyptiaco-Arabica* (Copenh. 1776). The accuracy of detail, fidelity of delineation, and careful avoidance of all exaggeration, which characterize Niebuhr's geographical and social descriptions of Arabia and other Asiatic countries, have made his works classical text-books for all who wish to study the subject. Although Niebuhr accepted, in 1778, a civil post, which fixed his residence in the remote provincial town of Meldorf, in the Ditmarsh district of Holstein, where he devoted himself during the rest of his life to the fulfillment of his official duties, he never relinquished his interest in scientific inquiry, and contributed several valuable papers on the geographical and political history of the nations of the East to the *Deutsche Museum*, and other periodicals. He died in 1815, leaving a character of being at once one of the most truthful and scientifically exact travelers of modern times.

NIÉDERMEYER, Louis, 1802–61, b. in Switzerland; when very young showed a strong taste for musical composition; afterward studied under Moscheles and other eminent masters at Vienna and Rome. His first opera was produced at Naples, but of several composed by him, *Stradella* (1836) was the only one which had much success. He also set to music a number of songs by Victor Hugo, Lamartine, and Manzoni. Perhaps the best of his works are his religious compositions which display great originality.

NIEL, Adolphe, 1802–69; b. France, having studied at the École polytechnic in 1821, and received a military education at the military academy of Metz, in 1827 he was made lieut. of engineers, in 1835 was promoted to capt., and accompanied the expedition against Constantine in Algeria, under generals Damrémont and Vallé in 1836–37. Gaining much distinction for bravery, he was raised to *chef-de-battaillon* and placed in command of the engineering corps in Algeria. He was raised to the rank of col. in 1846. In 1849, as the head of the staff of engineers he took part in the suppression of the revolutionary movements at Rome then defended by Garibaldi who surrendered after a siege of two months. He was then promoted to the rank of brig.gen. and accomplished the official duty delegated to him, of carrying the key of the city to the pope at Gaeta. Returning to Paris he was appointed director of the engineering department in the ministry of war, and in 1853 was raised to the rank of gen. of division, and in alliance with the English fleet, conducted the siege which destroyed the important Russian fortress of Bomarsund in Aug., 1854. He planned the operations through which Sevastopol was overcome, by the allied armies of England and France, in 1854–55, after a siege of 11 months, and commanded the engineers in the Crimea. He was aid-de-camp to the emperor, and after the taking of the Malakoff was decorated with the cross of the legion of honor. In 1859 he was sent as ambassador to the court of Victor Emmanuel, to demand the hand of princess Clothilde for prince Napoleon. He distinguished himself in the campaign in which occurred the battle of Solferino, June 24, 1859, and was made a marshal of France. In 1867 he was minister of war, and throughout his career sustained a high reputation as a scientific military officer.

NIEL'LO-WORK, a method of ornamenting metal plates by engraving the surface, and rubbing in a black or colored composition, so as to fill up the incised lines, and give effect to the intaglio picture. It is by no means quite certain when this art was originated; Byzantine works of the 12th c. still exist to attest its early employment. The finest works of this kind belong to the former half of the 15th c., when remarkable excellence in drawing and grouping minute figures in these metal pictures was attained by Maso di Finiguerra, an eminent painter, and student of Ghiberti and Massacio. In his hands it gave rise to copper-plate engraving (see Engraving), and hence much interest attaches to the art of niello-cutting. Genuine specimens of this art are rare, some of those by Finiguerra are very beautiful and effective, the black pigment in the lines giving a pleasing effect to the surface of the metal, which is usually silver. Those of his works best known are some elaborately beautiful pattines wrought by him for the church of San Giovanni at Florence, one of which is in the Uffizia, and some are in various private collections. In the collection of ornamental art at South Kensington, there are no less than 17 specimens of this art.

NIEMANN, Albert, b. Germany, 1831; at first a singer in the chorus at Dessau. The magnificence of his tenor voice attracted the attention of the king of Hanover, who took him into his service. Wagner selected him to sing in *Tannhäuser* on its first production in Paris in 1861.

NIEMBSCH VON STREHLENAU. See LENAU, NIKOLAUS, *ante.*

NIEMCEWIECZ, JULIAN URSIN, 1757–1841, b. Poland; entered the army as an adjutant at the age of 20, and became an intimate friend of Kosciuszko. After a tour in England and on the continent, he left the army in 1788, and entered the Polish diet as a deputy from Livonia, and became an advocate of the patriotic party. In 1791 with his colleague Weysscnhoff, he began the publication of the *National and Foreign Gazette,* and he also encouraged the spirit of nationality by his poems and dramas. He drew up the so-called "constitution of the 3d of May," which changed Poland from an elective to an hereditary monarchy, and abolished many of the privileges of the nobility. In the insurrection caused by the second partition of Poland, Niemcewiecz was the adviser and aid-de-camp of Kosciuszko; and he was wounded and taken prisoner at the disastrous battle of Macieiowice. During his imprisonment of 2 years, at St. Petersburg, he familiarized himself with the English poetry of the 18th c., and translated Pope's *Rape of the Lock.* On his release he came with Kosciuszko to this country, where in 1800. he married Mrs. Livingston-Kean of New York. Among his acquaintances in America, were Jefferson, and the exiled duke of Orleans, who afterwards became king Louis Philippe. In 1802 he was allowed to return to Poland on the death of his father. He came back to the United States for a brief period; but when Napoleon entered Poland in 1806, he sailed for Europe, and on the establishment of the grand-duchy of Warsaw, the king of Saxony made him secretary of the senate, inspector of schools, and member of the supreme council of public instruction. After Poland again passed under the power of Russia, though retained by the emperor Alexander in his office of perpetual secretary, he kept alive the memories of Polish nationality, in his *Historical Ballads,* 1816. He delivered a funeral oration over Kosciuszko in 1817, and in 1822 began the publication of his *Collection of Memoirs on Ancient Poland,* celebrating the national heroes of Poland. He took part in the unsuccessful revolution of 1830, and spent the rest of his life in exile. Besides the works already named, he published novels, comedies, and tragedies. His *Notes on My Captivity in St. Petersburg,* appeared in 1843, and was translated into English, the next year. A volume of memoirs of his own time was published at Paris, in 1848.

NIE'MEN (called by the Germans *memel*) a river in Prussia, rises a few miles s. of the city of Minsk, flows westward to Grodno 180 m., n. and w. along the frontiers of the Polish province of Augustowo, and w. through East Prussia to the Kurische Haff. Entire length, 640 miles. It is navigable for large craft at Grodno, 400 m. from its mouth, and is free of ice from March to November. Between Grodno and Kovno there are 55 rapids and shallows, and pilots are therefore required for the navigation of the river. At Winge, 8 m. below Tilsit, the Niemen divides into two branches, of which the northern, the Russ, reaches the Kurische Haff by nine months; and the southern, the Gilge, by seven mouths. The delta is traversed by several canals. The Niemen is of considerable commercial importance. Large barges bring down the produce of Lithuania and of a portion of Poland to Konigsberg and Memel. Corn, hemp, flax, hides, and bacon, are the principal articles brought from the interior. Its principal affluent is the Vilna on the right.

NIEPCE, JOSEPH NICEPHORE, 1765–1833, b. France; entered the army, but resigned on account of ill-health, and in 1795 became civil administrator of the district of Nice. He resigned in 1801, and thenceforward pursued the study of chemistry and mechanics. In 1813 he made researches in regard to the production of pictures upon metallic plates by means of light. In 1824 he was able to fix images by light upon plates of glass, and afterwards of copper, and of silver covered with a thin coating of bitumen. He entered into a partnership with Daguerre in 1829.

NIEPCE DE ST. VICTOR, CLAUDE-FELIX-ABEL, a French chemist and photographer, was b. at Saint Cyr, near Chalon-sur-Saone, July 26, 1805. He served for some time in the army; but having made an important chemical discovery in connection with dyeing, he was permitted to exchange into the municipal guard of Paris, that he might pursue his scientific studies with more facility. This was in 1845, at which time his attention having been forcibly attracted to the important discoveries in photography which had been made by his uncle Nicephore Niepce (see PHOTOGRAPHY), he resolved to devote his energies to this subject. He was led, in 1847, to the discovery of methods for obtaining images on glass, coated with albumen, starch, or gelatine, and for reproducing designs by the use of vapor of iodine. His investigations were for a time interrupted by the revolution of 1848, but he soon resumed them, directing his attention more especially to the obtaining of photographic images in colors; and before the close of 1852, he had succeeded in obtaining faithfully colored images of flowers, natural and artificial, colored engravings, gold and silver lace, etc., upon silvered plates which had been sensitized by a chloride of copper. In obtaining these pictures, both photographic printing and the camera were employed; but to his intense disappointment, he found that the colors soon began to fade, and after a time disappeared. This process he named "heliochrome." His third and most important invention, that of the art of "heliography," or the production of engraved steel-plates by photography, was first communicated to the academy of sciences in May, 1853. He does not deserve the credit of having originated the idea; for his uncle, previous to 1839, had communicated an imperfect sketch of a similar invention to M. Arago; and Mr. Talbot and others had succeeded by a similar process in

obtaining images of simple objects on steel plates; but to Niepce belongs the credit of having removed the almost insurmountable manipulative difficulties, and rendered the process of much more general application, thus making it practically serviceable. He afterwards employed himself in improving and perfecting his various discoveries.

In 1855 he published the various memoirs in which he had at different times communicated his three great discoveries to the academy of sciences, under the title of *Recherches Photographiques*, which was followed, in 1856, by *Traité Pratique de Gravure sur Acier et sur Verre*. He presented to the academy a number of memoirs on the action of light on a variety of substances, the last being *Sur l' Action de la Lumière et de l'Electricité* (Feb., 1860). Niepce's scientific studies did not interfere with his military promotion, as he was successively appointed chef-d'escadron, and (1854) commandant of the Louvre. He died in April, 1870.

NIERIKER, Mary A. See Alcott, May.

NIER'STEIN, a market village (pop. 2,600) of Hessen-Darmstadt, in the province of Rhein-Hessen, and 9 m. s.s.e. of Mayence, gives name to a well-known and highly-prized variety of Rhenish wine, which is produced in the neighborhood.

NIESCHIN, a t. in Russia, on the Ostr river, 35 m. s.e. of Tchernigov; pop. 21,590. It contains a monastery, a cathedral, churches, an hospital, schools, and a gymnasium. The chief production and export is tobacco.

NIEU'WER AMSTEL, a t. of the Netherlands, in the province of North Holland, 5 m. s. by w. from Amsterdam. Pop. 8,066. A few miles to the e. of it is the village of Ouder Amstel, with about 3,000 inhabitants, on the Amstel, one of the smaller mouths of the Rhine, which passes through the city of Amsterdam, and falls into the Zuider Zee

NIEU'WVELDT MOUNTAINS, a portion of the most northerly of the three ranges of mountains in Cape Colony, which at various distances from the southern coast all run parallel to it. Of these three ranges, the most northern attains the greatest altitude, having an average height of 7,000 feet. The portion known as the Nieuwveldt mountains extend in lat. 31° 40′ to 32° 30′ s., and are intersected by the meridian of 22° e. longitude. From their southern slopes, the Gamka or Lion river draws its head waters; and from their northern, the Gariep or Orange river obtains an important tributary in the Upper Zak.

NIEVRE, a central department of France, occupies a portion of the watershed between the Loire and the Seine, and is bounded on the w. by the rivers Allier and Loire. Area, 2,620 sq. m.; pop., 1881, 347,576. Mountains occupy the eastern border, and extend in a line of heights from s.e. to n.w., dividing the department into two great declivities. The soil is generally rocky and sandy, cut up by ramifications, almost always wooded, of the mountains of Morwan. There are several plateaus more or less fertile, a number of hills covered with vines, and valleys productive in pastures; but the principal wealth of the department consists in its forests and minerals. The Nièvre, whence the name of the department, is an inconsiderable affluent of the Loire from the right. The three chief rivers—the Allier, Loire, and Yonne—are navigable, and the Yonne, which belongs to the system of the Seine, is connected with the Loire by a canal leading across the watershed. Of the entire area, more than 792,000 acres are cultivable land, and more than a third of the whole surface is covered with forests, the timber from which, forming one of the principal sources of wealth, is conveyed by water in great quantities to Paris, etc. About 6,000,000 gallons of wine are made yearly. From the mines of Nièvre iron of good quality is obtained in abundance; lead, copper, and silver are also found; and there are coal mines, and quarries of marble and granite. Arrondissements, Nevers, Château-Chinon, Clamecy, and Cosne; capital, Nevers.

NIFLHEIM (from the same root as Lat. *nebula*, cloud, and Eng. *home*), meaning the abode of clouds, was one of the nine separate abodes or homes, of which the old Scandinavians conceived the world as consisting in the beginning of time. It is the kingdom of cold and darkness, and is separated from Muspelsheim, the kingdom of light and heat, by a huge chasm (Ginungagap, yawning gap). Here flows the spring Hvergelmir, watched by the dragon Nidhugger; this spring sends out twelve ice-rivers, from the drops of which, thawed by sparks from Muspelsheim, sprang the chaotic giant Ymir and the cow Audhumbla. Niflheim was also the abode of Hel (q. v.), the goddess of death, who here received all who died of sickness or old age.

NIGEL'LA, a genus of plants of the natural order *ranunculaceæ*, having five colored spreading sepals; five or ten small two-lipped petals, with tubular claw; the carpels more or less connected together, many-seeded; the leaves divided into threadlike segments, the flowers solitary at the top of the stem or branches. They are annuals, natives chiefly of the countries near the Mediterranean and the warmer temperate parts of Asia. Some of them, occasionally seen in gardens in Britain, are vulgarly known by the names *Devil-in-a-bush* and *Devil-in-a-mist*. The seeds are aromatic, and somewhat peppery. Those of *Nigella sativa*, a species common in cornfields in the s. of Europe, are supposed to be the Black Cummin of the ancients, and perhaps the Cummin of the Bible. The seeds of a species of Nigella are much used by the Afghans for flavoring curries.

NI'GER, the great river of western Africa. Its name, according to Dr. Barth, is a contracted form of one of the native names, *N-eghírrĕu*, which, as well as all the other

names, *Dhiulibá* (*Joliba*), *Mayo*, *Isa*, *Kwara* (*Quorra*), and *Baki-n-ruwa*, means simply "the river." The principal head-water rises on the slopes of mount Loma, a peak of the Kong mountains, in a barren, desolate, and treeless region, in lat. 9° 25′ n., long. 9° 45′ w., about 1,600 ft. above sea-level. It flows n.e. to Timbuktu, where it bends eastward, and after flowing in that direction for about 250 m., it curves toward the s., and proceeds in a general s.s.e. course, until arriving at the head of its delta, in lat. about 5° 30′ n., it separates into many branches, and enters the gulf of Guinea, between the bights of Benin and Biafra. It is called the Timbri for the first 70 m. of its course, after which it receives the name of the Joliba, or more correctly Dhiúlibá; and after passing Timbuktu, it is known principally as the Quorra. Little is known of its course until it reaches Sego (lat. 12° 30′ n.), a distance of 350 m. from its source, but from that point it has been explored throughout nearly the whole of its course. From Sego to Timbuktu it flows through a fertile country, producing rice, maize, and vegetables, and abounding in good pasturage. In lat. 14° 10′ n., the river separates into two branches; the western is called the Joliba or Mayo, the eastern the Bara-Isa. These, as they proceed, are known as the White and Black rivers respectively; and they unite after inclosing the island of Jimballa, 220 m. in length, and from 2 to 20 m. in breadth The river again bifurcates before arriving at Timbuktu, and after passing that town, the two branches, on one of which—the northern—Cabra, the port of Timbuktu is situated, again unite. In the district of union in the s.w. of Timbuktu, the country far and wide is intersected by numberless streams, forming a complicated net-work of water-courses. The river then flows e., sending off many creeks and branches to Bamba; its banks here are low and marshy, and during the rainy season are overflowed. In this region, rice, tobacco, wheat, and even barley are grown. The river then passes the town of Burrum, where it curves to the s.e., and from this point—called from the bend, the *Knee of Burrum*—it bears the name of Kwara or Quorra until it reaches the delta. Immediately below *Burrum*, the Niger does not present an imposing appearance. Its bed resembles a broad marshy valley, inclosed by ridges of rock or high dunes, thickly overgrown with reeds and sedges, and cut up by numberless streams and creeks. At the ferry of Burri (lat. 15° 55′ n.), the breadth of the river is from 800 to 900 yards; and here the whole valley, about 10 m. broad, is fruitful, carefully cultivated, and well peopled. Further s., the towns of Garu and Sandu are passed, and here the bed is rocky and the navigation dangerous. At the town of Say, the Niger, after reaching a breath of from 2,500 to 3,000 paces, is narrowed to a width of 1,000 paces, flows at the rate of three miles an hour, and is inclosed by rocky banks. From Say to Wara, the course of the Niger remains still unknown. From Wara it flows e.s.e. to Rabba; and from this town to its mouth, the course of the river is comparatively well known. In lat. between 8° and 7° 30′ n., it flows round the eastern shoulder of the Kong mountains (2,000 to 3,000 ft. high), and here the banks of the Niger are extraordinarily beautiful. In lat. 7° 40′ n., it receives the Benne from the e. The delta consists of an immense mangrove forest, cut up into islands by the numerous branches (22 in number) of the river. The principal mouths are the Bonny, Mari, and Nun.

The existence of the Niger seems to have been first made known in ancient times by travelers from the s. shores of the Mediterranean, who, crossing the great desert, came upon the upper course of a great river flowing toward the rising sun. This river Herodotus supposed to be a branch of the Egyptian Nile. Pliny speaks of the *Nigris* of Ethiopia, but he also thought that it flowed into the Nile. No definite notion on the river had been formed until it was visited by Mungo Park in July, 1796, when this traveler explored its banks for a distance of 160 m. See PARK, MUNGO. Caillié explored the river from the town of Jennee to Timbuktu; and the English expedition of 1832, under Lander and Allen, proved that the Quorra was navigable from Boussa to the sea; information, however, which was obtained at an immense cost of human life from the unhealthiness of the climate. Subsequent expeditins have ended with similar results. In 1864, Dr. Barth followed the course of the river from Timbuktu to Say, and much of what is now known about the Niger is due to his labors. The entire length of the river is estimated at upwards of 2,500 miles.—Barth's *Travels in Central Africa.*

NIGHT-HAWK, *Chordeiles Virginianus*, a bird of the goatsucker family (*caprimulgidæ*) very common in America, from the Arctic islands to the West Indies. It is a bird of passage, visiting the north in summer. It is about nine inches in length, and 23 inches in expanse of wing. The gape is destitute of bristles. The tail is slightly forked. The general color is brown, but it is much mottled and marked with white; and there is a white mark on the throat, in shape like the letter V. The night-hawk is seen pursuing its insect prey in the air, chiefly before sunset, and before dawn, and attracts attention by its rapid repetition of a sharp impatient cry, which has gained for it the name *Piramidig.* It produces also in its flight a remarkable hollow booming sound, "like blowing into the bung-hole of a barrel," in the moments of its perpendicular descent through the air. Its movements in the air are extremely beautiful and rapid. When fat and plump, as it usually is on its southward migration, it is esteemed for the table, and great numbers are shot.

NIGHT HERON, *Nycticorax*, a genus of *ardeidæ* (See HERON), intermediate in form between bitterns and herons, but with shorter and thicker bill than either, and legs

shorter than in herons. The COMMON Night Heron (*N. Gardeni* or *Europæus*) is found in Europe, Asia, Africa, and North America, chiefly in the warmer temperate regions. It is most abundant in America, and is partly a bird of passage. It is a very rare visitant of Britain. Its length, from the tip of the bill to the end of the short tail, is fully two feet. It weighs nearly two pounds. Its plumage is soft, the general color ash-gray, passing into black on the neck and head, and into white on the breast and belly. The back of the head is adorned with three very long white feathers, which hang down on the neck. The nests are built in trees, and in general many together, forming a *heronry*. The night heron feeds chiefly by twilight or at night; and is never seen standing motionless, like herons, but walks about in search of prey, by the sides of ditches, ponds, etc.; its food consisting chiefly of fishes, frogs, and other aquatic animals. Its cry is very loud and hoarse.—Other species of night heron are found in Africa and Australia.

NIGHTINGALE, *Philomela*, a genus of birds of the family *sylviadæ*, approaching in character to the *merulidæ*, the young having their first plumage mottled, as in the thrushes, and the legs being longer than in the fauvettes and other *sylviadæ*, with which they are commonly classed. The bill is straight, slender, not quite as long as the head; the wings do not much pass beyond the base of the tail; the first quill is very short, the third is the longest; the tail is slightly rounded.—The COMMON NIGHTINGALE (*P. luscinia*) is well known as the finest of songsters. It is rather larger than the hedge-sparrow, with about the same proportionate length of wings and tail. It is of a rich brown color above, the rump and tail reddish, the lower parts grayish-white. The sexes are alike. It is a native of many parts of Europe and Asia, and of the north of Africa; and is a bird of passage, extending its summer migrations in the continent of Europe as far north as the south of Sweden, but in Britain it has scarcely ever been seen further north than Yorkshire. It is plentiful in some parts of the south and east of England, but does not extend to the western counties, and never appears in Ireland. It frequents thickets and hedges, and low damp meadows near streams. The extensive market-gardens near London are among its favorite haunts. It feeds very much on caterpillars and other larvæ. It arrives in England about the middle of April, the males ten or fourteen days before the females. It is at this season, and before pairing has taken place, that bird-catchers generally procure nightingales for cage-birds, as they then become easily reconciled to confinement, whilst, if taken after pairing, they fret and pine till they die. The nightingale makes its nest generally on the ground, but sometimes on a low fork of a bush. The nest is loosely constructed of dead leaves, rushes, and stalks of grass, with a lining of fibrous roots. The eggs are four or five in number, of a uniform olive-brown. The song of the male ceases to be heard as soon as incubation is over. In captivity, however, it is often continued through a more considerable period. The nightingale usually begins its song in the evening, and sings with brief intervals throughout the night. The variety, loudness, and richness of its notes are equally extraordinary; and its long quivering strains are full of plaintiveness as well as of passionate ecstasy. The nightingale has been a favorite from most ancient times; and is often mentioned in the poetry of India and Persia, as well as of Greece and Rome. The loves of the nightingale and the rose are a fanciful theme in which eastern poets delight. The nightingale much resembles the redbreast in manners, and is equally pugnacious. It has been known to breed with the redbreast in captivity.—There is another and rather larger species of nightingale in the east of Europe, faintly mottled on the breast.

NIGHTINGALE, FLORENCE, famed for her labors in reforming the sanitary condition of the British army, is the daughter of William Shore Nightingale of Embly park, Hampshire, and Leigh Hurst, Derbyshire, and was born at Florence in 1823. Highly educated, and brilliantly accomplished, she early exhibited an intense devotion to the alleviation of suffering, which, in 1844, led her to give attention to the condition of hospitals. She visited and inspected civil and military hospitals all over Europe; studied with the sisters of charity in Paris the system of nursing and management carried out in the hospitals of that city; and, in 1851, went into training as a nurse in the institution of Protestant deaconesses at Kaiserswerth, on the Rhine. On her return to England, she put into thorough working order the sanitorium for governesses in connection with the London institution. Ten years was the term of apprenticeship thus served in preparation for the work of her life. In the spring of 1854 war was declared with Russia and a British army of 25,000 men sailed to the east. Alma was fought Sept. 20, and the wounded from the battle were sent down to the hospitals prepared for their reception on the banks of the Bosporus. These hospitals were soon crowded with sick and wounded, and their unhealthy condition became apparent in a rate of mortality to which the casualties of the fiercest battle were as nothing. In this crisis Miss Nightingale offered to go out and organize a nursing department at Scutari. The late lord Herbert, then at the war-office, gladly accepted, and within a week from the date of the offer—viz., Oct. 21—she departed with her nurses. She arrived at Constantinople Nov. 4, the eve of Inkermann—the beginning of the terrible winter campaign—in time to receive the wounded from that second battle into wards already filled with 2,300 patients. Her devotion to the sufferers can never be forgotten. She has stood twenty hours at a stretch, in order to see them provided with accommodation and all the requisites of their condition. But she saw clearly in the bad sanitary arrange-

ments of the hospitals the causes of their frightful mortality, and her incessant labor was devoted to the removal of these causes, as well as to the mitigation of their effects. In the spring of 1855, while in the Crimea organizing the nursing-departments of the camp-hospitals, she was prostrated with fever, the result of unintermitting toil and anxiety; yet she refused to leave her post, and on her recovery remained at Scutari till Turkey was evacuated by the British, July 28, 1856. She, to whom many a soldier owes his life and health, had expended her own health in the physical and mental strain to which she had subjected herself. It is known that for years Miss Nightingale has been an invalid. It is not so well known that her sick-room has been the scene of the most arduous and constant labor for the improvement of the health of the soldier. In 1857 she furnished the "commissioners appointed to inquire into the regulations affecting the sanitary condition of the British army" with a paper of written evidence, in which she impresses, with the force and clearness which distinguish her mind, the great lesson of the Crimean war, which she characterizes as a sanitary experiment on a colossal scale. Her experience in the Crimea, the results obtained by the labors of the sanitary commission, results accumulated under her own eyes, showing that the rate of mortality among soldiers could be reduced to one-half of what it was in time of peace at home, turned the attention of Miss Nightingale to the general question of army sanitary reform, and first to that of army hospitals. In 1858 she contributed two papers to the national association for the promotion of social science, on hospital construction and arrangements, afterwards published, along with her evidence before the commissioners, by J. W. Parker and son. The *Notes on Hospitals*, from their clearness of arrangement and minuteness of detail, are most valuable to the architect, the engineer, and the medical officer. In 1858 she published her *Notes on Nursing*, a little volume which is already among the treasured text-books of many a household. At the close of the Crimean war a fund was subscribed for the purpose of enabling her to form an institution for the training of nurses. The interest of the fund amounts to £1400 per annum; and though no separate institution has been formed, it is spent in training a superior order of nurses in connection with St. Thomas's and King's college hospitals. In the year 1863 was issued the report of the commission on the sanitary condition of the army in India. The complete report, with evidence, occupies two folio volumes of nearly 1000 pages each. The second of these huge folios is filled with reports from every station in India, occupied by British and native troops. These reports were sent in manuscript to Miss Nightingale, and at page 347 of vol. i. are inserted her observations upon this immense mass of evidence. In these observations, the facts are brought together in an order, and with an incisive force of statement, which render it one of the most remarkable public papers ever penned. That report is likely to inaugurate a new era in the government of India; for the views of Miss Nightingale extend not only to the sanitary reform of the British army, but to that of the towns of India. In 1871 Miss Nightingale published *Notes on Lying-in-Institutions, together with a proposal for organizing an Institution for training Midwives and Midwifery Nurses;* in 1873, *Life or Death in India*, and (in *Fraser's Magazine*) "A 'Note' of interrogation," which attracted a good deal of attention, mainly on account of the way she handles religious beliefs and life.

NIGHT-JAR. See GOATSUCKER.

NIGHTMARE, *Incubus, Ephialtes,* consists in a horrible dream, the terror being inspired by a sense of weight or oppression referred to the pressure of mountains, giants, hags, serpents, upon the breast. It is attributed to acceleration or irregularity of the circulation in the chest or in the brain. It has been traced backward to plethora, posture, heavy suppers; and forward as a prognostic of heart disease or hydrothorax. It differs from ordinary dreams in possessing always the same characteristic of fear of some object in contact with the body, in a recognized inability to move or speak while there is a strong desire to do both, and in the presence of a semi-consciousness of the real source of the apprehension. The affection is recorded to have been epidemic; and modern instances have occurred where large communities have been agitated by night panics. A regiment of French soldiers, quartered in a ruined monastery, were awakened, at the same hour in two successive nights, by a black dog leaping on the breast of each. These veteran warriors, inured to danger, inaccessible to superstition, could not be prevailed upon to make a third trial. Such frightful impressions occur during the day, and during mere somnolency or drowsiness, but more generally at the moment of awakening during the night. The time, the distinct recollection retained of the circumstance, and the bodily perturbation which remained when consciousness was re-established, all conspired to convert these visions into the objective hobgoblins, the omens and supernatural revelations of past ages; and which still linger as matter of belief where the temperament or situation of the individual resembles those of our ancestors. In a very large number of instances such dreams represent, or are continuations of, the previous waking thoughts and emotions. They are so far voluntary that indigestible food or excess may induce them. Fuseli, for artistic purposes, created "chimeras dire" in sleep by supping on pork chops.

NIGHTSHADE, the English name of certain plants of the natural order *solanaceæ* (q.v.), possessing the narcotic properties frequently developed in that order. Among

them are some species of *solanum* (q.v.), particularly the COMMON NIGHTSHADE, or BLACK NIGHTSHADE (*S. nigrum*), an annual or biennial, with erect angular stem, ovate, sinuate-dentate leaves, drooping lateral umbels of white flowers, and globose black berries; a frequent weed in waste places in England and in most parts of the world. Few plants are more widely diffused. It is only slightly narcotic. The leaves, in a fresh state, are said to be injurious to animals which eat them, but seem to lose almost all narcotic property by boiling, and are used as spinach, particularly in warm climates. The berries, although generally dreaded or suspected, may also, it is said, be eaten, at least in moderate quantity, without danger. They contain, however, the alkaloid *solanine* found also in the shoots of the potato.—WOODY NIGHTSHADE, see BITTERSWEET. For DEADLY NIGHTSHADE, see BELLADONNA. For ENCHANTER'S NIGHTSHADE, see CIRCÆA.

NIGRITIA. See SUDAN, *ante*.

NI'HILISM is a term used of certain philosophical or half-philosophical systems of "negative" tendency, especially such as deny God, the soul, and the moral distinction between good and evil. Of late, however, it has become familiar throughout Europe as applied to the hyper-revolutionary programme of a Russian organization in various ranks of society. The young men at the universities seem to be largely addicted to Nihilism, and are equaled in their zeal by the "fair girl graduates" of Russia. The Nihilists are said to have adopted many of the socialistic views of Proudhon (q.v); but while their scheme is in other respects vague and ill-compacted, their foremost principle is the belief that society may be and ought to be regenerated by a sudden and sweeping overthrow of most existing social and political institutions. Towards preparation for this extensive undertaking, their bold propagandism is especially directed. While violently opposed to Pan-slavism (q.v.) as supporting old and obsolete notions of nationality and patriotism, cosmopolitan Nihilism is yet so far purely Russian as apparently not to have established direct relations with the socialistic organizations of western Europe. Herzen (q.v.), as an admirer of west European culture, widely to be distinguished from the Nihilists, gave a powerful impetus to the spread of democratic opinions in Russia. But the great leaders of the Nihilistic movement were the indefatigable agitator Michael Bakunin (born 1814) and the journalist Tchernyschevski. In 1869, during certain students' demonstrations, revolutionary manifestoes were distributed. Much was done for promoting revolutionary opinions through the medium of Sunday-schools, ere these were suppressed by government. Young men of good birth adopted menial callings in order to understand the grievances and burdens of their poorer brethren, and to enter with fuller sympathy into their feelings. Nihilistic associations began to display organized activity, and considerable funds were collected. Government now began numerous prosecutions. In 1871 there was a lengthened trial, and numerous condemnations to Siberian exile. In 1875 an actual rising took place under a red banner, amongst the students at Kazan. In 1877 139 persons, mostly young men and women, were tried, and many condemned. The unanimous acquittal by a St. Petersburg jury of the lady assassin, Vera Sassulitch, who attempted the life of gen. Trepoff, governor of a prison, displayed a dangerous condition of public feeling, and led to the significant, though "temporary," withdrawal of the trials for political crimes from juries, these being now assigned, to courts-martial. The assassination, by Nihilists especially commissioned, of the general at the head of the secret police of Russia and of the governor of Kharkov, in 1878 and 1879, show the boldness and persistency of the Nihilistic propaganda.

NIHILISTS (from Latin *nihil*, "nothing"), a revolutionary organization in Russia, aiming at the destruction of all existing laws, religions, and political and social systems, while preparing to replace them with nothing. It is stated that the term was first employed by the Russian novelist, Ivan Turgenieff, in his stories of Russian society. It was, however, accepted by the organization itself, as will appear in the following quotation from a speech by a member, and which may be accepted as fairly significant of the doctrines with which the minds of the advanced radicals of Russia have become imbued. "Nothing, in the present state of social organization, can be worth much, for the simple reason that our ancestors instituted it. If we are still obliged to confess ourselves ignorant of the exact medium between good and evil, how could our ancestors, less enlightened than we, know it? A German philosopher has said: 'Every law is of use. It rules the conduct of individuals who feel for one another and appreciate their respective wants. Every religion, on the other hand, is useless; for ruling, as it does, our relations with an incommensurable and indefinite Being, it can be the result only of a great terror or else of a fantastic imagination.' Now, we Nihilists say, no law, no religion—nihil! The very men who instituted these laws ruling their fellow-creatures have lived and died in complete ignorance of the value of their own acts, and without knowing in the least how they had accomplished the mission traced for them by destiny at the moment of their birth. Even taking it for granted that our ancestors were competent to order the acts of their fellow creatures, does it necessarily follow that the requirements of their time are similar to those of to-day? Evidently not. Let us then, cast off this garment of law, for it has not been made according to our measure, and it impedes our free movements. Hither with the axe, and let us demolish everything. Those who come after us

will know how to rebuild an edifice quite as solid as that which we now feel trembling over our heads." Two points will be observed in this manifesto: the one being its positive antagonism to all existing things—because they exist; the other the sophistry with which the accepted position is reasoned out to a logical conclusion. And this brings us naturally to the starting points of Russian nihilism: in the influence of the Russian history; in the nature of the Russian people; and in the exceptional character of the Russian political system.

The present autocracy of Russia was originally an oligarchy, and not until Ivan I. (III.) founded the existing Russian empire in the 15th c. was the power of the grand-dukes, true oligarchs, destroyed. Autocracy was cemented by his immediate descendant, Ivan the terrible, by Peter I., Katherine II., and finally by Nicholas. Under the changed political condition instituted by these monarchs, there came to be but three orders or classes among the Russian people: the czar, the nobility and aristocracy, and the serfs: there was no *bourgeoisie* or middle class. This anomalous condition is supplemented by another; the existence for centuries of the *mir*, an actual democracy, which has outlived tyranny and spoliation, and by which each village community has kept alive the ideas of socialism and equal rights. The *mir* is in fact a co-operative association of the local peasantry, under a head elected by themselves, who exercises parental authority in conjunction with the village parliament which is convened in cases of emergency. This institution is primitive in its origin, which was Slavonic, is patriarchal in discipline, and preservative of the socialistic element in rural economy. Through its means exists the veritable commune in Russia; since the arable land and pasturage belong not to individuals, but are the collective property of the commune, which enjoys unlimited authority in making allotments and in the redistribution of the soil. These village communes contain about five-sixths of the population, and are opposed to Cæsarian despotism on the one hand, and centralized bureaucracy on the other. When to this extraordinary combination of factors is added that of the persistent tendency of the Russian aristocracy toward anarchy—which is a historical fact—it will be seen what a readiness there is for socialistic ideas and positive revolutionary principles. After Ivan the terrible, a period of actual anarchy existed in Russia, when the boiars (barons) succeeded in fastening still more strongly the chains of servitude upon the unhappy serfs. The accession of Michael Romanoff to the throne, and the foundation of a new dynasty, proved to be the death-blow to their hopes for ascendency in the realm, and there was nothing for them, and for all the petty potentates and government officials in the empire, but to continue an iron grasp on the lower order, for the increase of their wealth and power, if not of their dignity. A reviewer in *Blackwood* has epitomized the situation: "We have the monarch who rules, the courtiers who assassinate, and the serfs who obey." And Mr. Gladstone wrote, so late as 1880, of what he called "the oligarchic, diplomatic, and military class:" "This class, or rather this conglomerate of classes, ever watchful for its aims, ubiquitous yet organized, standing everywhere between the emperor and the people, and oftentimes too strong for both, is at work day and night to impress its own character upon Russian policy." Under Ivan the terrible was organized the opritchini (elect, or covenanted), a body of guards, selected sometimes from the lowest of the people, who swore implicit obedience to the czar, and in return were chartered libertines, robbers, and assassins. Each of them exercised a despotism as odious in its sphere as that of the czar, and they became the nucleus of a new kind of nobility, the nobility of function and government employ, which for all practical purposes nearly superseded the hereditary nobility. It is to be remembered that Nicholas ascended the throne over the ruins of a conspiracy which only his personal majesty and invincible courage enabled him to control; and this by such a massacre of those engaged in the uprising, that in one day 15,000 persons were slain, whose bodies were thrown by torchlight into the Neva. But before the accession of Nicholas, in 1821, when all Europe was convulsed with revolutionary disorder, Russia began to feel the influence of the new ideas which pervaded the political atmosphere of the entire continent, and did not escape the infection of secret societies which had been brought back by the armies from France. It is not unreasonable to suppose that it was this influence which brought about the insurrection of Dec., 1825; since one of the leaders in the outbreak was Alexander Hertzen, who with Bakunin, is considered a founder of the nihilist organization; and who continued throughout his life (he died in 1870) to disseminate the most advanced radical opinions. As an illustration of the tendency of his writings, we have the following: "Despotism itself lives behind wooden walls, and has no stability. A conservative government like that of Austria has never been possible in Russia; we have nothing to conserve, because there is nothing stable among us. . . . . Every government brings into question existing rights and institutions; what was ordered yesterday is countermanded to-day. Because there is no historical basis, we love novelties to distraction."

Alexander II. ascended the throne under circumstances which, though less sanguinary than those of his father's accession, were yet essentially untoward. Apparently everything was in ruins: the military system had broken down; the Crimean war had been a disaster; the administrative machinery of the state had almost collapsed. In closing the Crimean war, the new emperor uttered a manifesto which was significant of his hopes and designs for the future of Russia. Among other expressions in it was the desire that "by the combined efforts of the government and the people, the public admin-

istration would be improved, and that justice and mercy would reign in the courts of law." The beginning of his reign was signalized by the copious use of the pardoning power; and in its second year he began to move in his vast enterprise of emancipating the serfs, by submitting the question to the nobles of the empire. The number of serf-owners in Russia was about 110,000, having under their control 23,000,000 peasants. In 1857 the emperor issued a ukase which was the beginning of the tremendous change which he had undertaken; and on Feb. 19 (March 3, N.S.), the emancipation law was completed, and the signature of Alexander II. gave freedom to 23,000,000 men. By the agrarian, or land law, which followed, the peasants of a commune were enabled to buy their holdings by a cash payment of about three years' rent, the state advancing four-fifths of the full payment, which was to be repaid, with 6 per cent interest, in 49 years. In the outset, under this act, Russia paid $500,000,000 to the landlords to settle the newly emancipated serfs upon their own holdings, comprising farms extending over 300,000,000 acres. And as the peasants, from time to time, failed to meet their payments, the government advanced the amount. The final result of the land-law will be that the peasant, by paying four-fifths of his rent for 49 years to the state instead of to his landlord, will, at the expiration of that period, have become absolute owner of his farm. It is to be observed that by the enforcement of the emancipation act and the land act, the landlords lost first, their serfs, and then 20 per cent of their rentals. The third great act of Alexander II., was to extend the system of the *mir*, or local self-government, so as to give the peasants entire control as to this, with a very complete organization of elected officials. As the emperor also reformed the judiciary; introduced trial by jury, and the system of trials in open court; made decided improvements in the public administration of office; promoted education, so that between 1860 and 1870 the number of children who could read multiplied five-fold; and finally destroyed most of the existing class distinctions, and relaxed the severity of the censorship of the press; the continued existence of nihilism, and its potency, as shown in the recent assassination of this very czar, present a most difficult social and political question. The anomaly of the union of many of the wealthiest and most aristocratic Russians, men and women, with students and other educated persons, with the peasant class, in a wide revolutionary movement, having for its avowed object the destruction of all existing institutions, would be inexplicable, but for the peculiar characteristics of Russian history—as already set forth; with other reasons now to be indicated. Mr. Gladstone has said of Alexander II.: "The present emperor of Russia has, during a reign now approaching a quarter of a century, given ample evidence of a just and philanthropic mind. No greater triumph of peaceful legislation is anywhere recorded than the emancipation of the Russian serfs which he has effected." Of these very serfs, or peasants, he has said: "They are a peaceful and a submissive race, whose courage in the field is that of a determined and uncalculating obedience.' '

We have referred, as one of the starting points of Russian nihilism, to the nature of the Russian people. This is not what has been generally supposed, particularly by Americans, who have received their conclusions ready-made from always antagonistic and contemptuous English sources—to whose utterances those of Mr. Gladstone stand as a relief. The current opinion as to the result of "scratching a Russian," derived from the emperor Napoleon I., who had no great cause to love the race, has been that this would be to disturb the Tartar savage beneath, and bring to light a disposition cruel, vindictive, and stubborn; and a temperament stolid and lethargic; a combination of the merciless Asiatic, and the boorish and phlegmatic Hollander of the picture-books. This conception is far from truth. The race is probably similar to the Irish in some characteristics; and to the French in its mercurial nature; while in strange combination it resembles the German in its fondness for abstract philosophical reasoning, and the Spaniard or Italian in its sensuousness and indolence. These latter characteristics give it an oriental stamp. As to the psychological tendencies of the Slave mind, Moritz Kaufmann writes that it is "singularly sensitive to the seductive influences of grand misty conceptions, while at the same time inclined to indolence and melancholy dejection"—again an oriental tinge. Keeping in view this fact; and remembering that in Russia there has been for centuries a struggle between the educated (aristocratic) class and the emperor; that while the individual administration of the government by the latter may have been excellent; that of his officials, from the highest to the lowest, has, confessedly, been infamous; that vast reforms were projected into the Russian system *en masse*, which elsewhere would have been the slow work of centuries; that these reforms, while they alienated from the emperor and autocracy the favor of the upper class, did not gain that of the lower; it may well appear that Russia needed only to be infused with an element powerful enough and insidious enough, to become distracted into any madness. The tendency of the emancipation act and the land act, however noble and beneficent these were in themselves, has been to undermine the confidence of the Russian peasant, by removing from him the only sure foothold that he knew. As the prisoner, long confined, pleads to return to his dungeon, the serf under his new condition of freedom, combined with that of proprietorship, is prostrated beneath an endowment which is an actual burden. For the peasant has to a certain extent merely changed owners—since as to his payments for land, he is obliged to depend on some principal man in the village. And, meanwhile, the old commune principle is being slowly eaten away, and that of

individualism with its consequent responsibilities and antagonisms—both utterly foreign to the experience and taste of the Russian peasant—assumes its place.

Michael Bakunin, supposed by some to have formulated nihilism out of the Hegelian philosophy, but whose theories are more naturally traceable to an utter materialism acting on the revolutionary ideas afloat in Europe during the first half of the 19th c., was born in 1814, and died in 1876. He was of a family high in rank and position, a near relative being aid-de-camp general to the late czar, and another governor-general of e. Siberia; was educated in the school for cadets in St. Petersburg; and on graduating was appointed an ensign in the artillery. In 1841 he went to Berlin and studied Hegel, where the master had taught a dozen years before; removing afterwards to Dresden, where he continued his studies with Arnold Ruge, and where he began to write on philosophical subjects. In 1843 he was in Paris, and by this time had become closely associated with the Polish refugees; and from there he visited Switzerland, where he was introduced into the communist and socialist societies. In 1847, in a speech made in Paris, he advocated a general Russian and Polish uprising against the emperor; this occasioned a request from the Russian government which procured his expulsion from France. A reward of 10,000 rubles was offered by the Russian government for his apprehension, and he fled to Brussels, but returned to Paris after the revolution in 1848. He attended the Slavic congress at Prague, and was involved in the revolutionary movement which followed; was one of the organizers and leaders of the riots in Dresden, from which city he fled after their suppression; and on May 10 was captured at Chemnitz. He was now tried, condemned, and sentenced to death in three countries—Prussia, Austria, and Russia; his punishment being in each instance commuted to that of imprisonment for life. He was confined for several years in the fortress of St. Petersburg, and then transported to e. Siberia, where he remained for several more years as a penal colonist, when he was permitted to settle in the Russian territory of the Amoor. Thence escaping by an American vessel, he proceeded by way of Japan and California to London. Here he was active in endeavors to incite the Russians and Poles to revolution, with the view of forming a great Slavic federal republic. In 1863 he went to Stockholm to aid the expeditions against the Baltic provinces. This enterprise failing, he proceeded to Switzerland, where he united with the internationals; but his attempt to create a secret society within their own, with the purpose of bringing about a condition of general anarchy, brought him into conflict with their leaders; and in 1872 he, with some of his friends, was expelled from the organization, when he retired from public action. In the meantime societies had been formed in Russia to promote the views of Bakunin and Hertzen, the "Young Russia," "Land and Freedom," etc.; and newspaper organs—the *Sovremiennik* and *Ruskoie Slowo*, were established and industriously circulated in the same interest. As presenting the strangely self-contradictory theories which dominated the new revolutionary order at this time, the following is quoted from a speech made at Geneva, in 1868, by Michael Bakunin—"the father of nihilism, the arch-conspirator:" "Brethren, I come to announce to you a new gospel which must penetrate unto the very ends of the world. This gospel admits of no half-measures and hesitations. The old world must be destroyed and replaced by a new one. The *lie* must be stamped out and give way to truth. It is our mission to destroy the *lie;* and to effect this we must begin at the very commencement. Now the beginning of all those lies which have ground down this poor world in slavery is God. For many hundred years monarchs and priests have inoculated the hearts and minds of mankind with this notion of a God ruling over the world. They have also invented for the people the notion of another world, in which their God is to punish with eternal torture those who have refused to obey their degrading laws here on earth. This God is nothing but the personification of absolute tyranny, and has been invented with a view of either frightening or alluring nine-tenths of the human race into submission to the remaining tenth. If there were really a God, surely he would use that lightning which he holds in his hand to destroy those thrones to the steps of which mankind is chained. He would, assuredly, use it to overthrow those altars where the truth is hidden by clouds of lying incense. Tear out of your hearts the belief in the existence of God; for as long as an atom of that silly superstition remains in your minds, you will never know what freedom is. When you have got rid of the belief in this priest-begotten God, and when, moreover, you are convinced that your existence and that of the surrounding world are due to the conglomeration of atoms, in accordance with the laws of gravity and attraction, then, and then only, you will have accomplished the first step toward liberty, and you will experience less difficulty in ridding your minds of that second lie which tyranny has invented. The first lie is *God*. The second lie is *right*. *Might* invented the fiction of right, in order to insure and strengthen her reign—that right which she herself does not heed, and which only serves as a barrier against any attacks which may be made by the trembling and stupid masses of mankind. *Might*, my friends, forms the sole groundwork of society. Might makes and unmakes laws, and that might should be in the hands of the majority. It should be in the possession of those nine-tenths of the human race whose immense power has been rendered subservient to the remaining tenth by means of that lying fiction of *right* before which you are accustomed to bow your heads and to drop your arms. Once penetrated with a clear conviction of your own

might, you will be able to destroy this mere notion of *right*. And when you have freed your mind from the fear of a God, and from that childish respect for the friction of *right*, then all the remaining chains which bind you, and which are called science, civilization, property, marriage, morality, and justice, will snap asunder like threads. Let your own happiness be your only law. But in order to get this law recognized, and to bring about the proper relations which should exist between the majority and minority of mankind, you must destroy everything which exists in the shape of state or social organization. So educate yourselves and your children that, when the great moment for constituting the new world arrives, your eyes may not be blinded by the falsehoods of the tyrants of throne and altar. Our first work must be destruction and annihilation of everything as it now exists. You must accustom yourselves to destroy everything, the good with the bad; for if but an atom of this old world remains, the new will never be created. According to the priests' fables, in days of old a deluge destroyed all mankind; but their God specially saved Noah in order that the seeds of tyranny and falsehood might be perpetuated in the new world. When you once begin your work of destruction, and when the floods of enslaved masses of the people rise and engulf temples and palaces, then take heed that no ark be allowed to rescue any atom of this old world, which we consecrate to destruction."

Here, the very "right" whose existence is denied is invoked as the basis of action.

In one nihilist speech it is asserted that the deeds of political assassins and incendiaries are not the offspring of any sentiment of personal hatred or vengeance. They know full well that one emperor killed will merely be succeeded by another, who in his turn will again nominate the chiefs of police and of the third section. Such deeds are justified by the necessity of rooting out from men's minds the habitual respect for the powers that be. The more the attacks on the czar and his officials increased, the more would the people come to understand the absurdity of the veneration with which they have been regarded for centuries. In March, 1876, several nihilist proclamations on their way to Russia were seized by the Prussian authorities at Königsberg. Paragraph xvi. of one of the documents ran thus: "You should allow yourselves to be influenced (in the selection of your victims) only by the relative use which the revolution would derive from the death of any particular person. In the foremost rank of such cases stand those people who are most dangerous and injurious to our organization, and whose sudden and violent death would have the effect of terrifying the government, and shaking its power by robbing it of energetic and intelligent servants. § xxiii.—The only revolution which can remedy the ills of the people is that which will tear up every notion of government by its very roots, and which will upset all ranks of the Russian empire, with all their traditions. § xxiv.—Having this object in view, the revolutionary committee does not propose to subject the people to any directing organization. The future order of things will doubtless originate with the people themselves; but we must leave that to future generations. Our mission is only one of universal, relentless, and terror-striking destruction. § xxvi.—The object of our organization and of our conspiracy is to concentrate all the forces of this world into an invisible and all-destroying power." Among the papers found on the nihilist lieut. Dubrowin, who was hanged for complicity with the regicide Solowjew, was a letter containing the following passage: "Our battalions are numerically so weak, and our enemies, on the other hand, are so mighty, that we are morally justified in making use of all attainable methods of proceeding which may enable us to carry on successfully active hostilities wheresoever it may become expedient." Again, the inevitable attempt at justification on the basis of the "right" whose existence is denied.

When one reads such propositions and declarations, and finds it difficult to conceive a sufficient reason for the existence of the sentiments and determination expressed, even in the most untutored and illy balanced, it is to be remembered that in Russia any tendency toward revolutionary expression has ever been met with instant and severe punishment. The knout and perpetual banishment at hard labor have been the modes in which autocracy has visited its displeasure on any movement against itself. While the czar of his own suggestion gave freedom and large actual possessions to 23,000,000 of his poorest and most unhappy subjects, he followed the traditions of the throne of Russia by sternly refusing to the higher classes anything resembling a constitution, or a national legislature. Attempts to gain these, and there were many such, served to people the penal colony of Siberia, precisely as did the more savage and mutinous attempts of the lower order in a similar direction. During many years the average number dispatched to Siberia, for all offenses, has been from 8,000 to 10,000 persons per annum; and of these, probably a large majority were for political crimes; very many of them educated, wealthy, and of high birth; among them not a few refined, cultivated, and gentle ladies. Siberia has the reputation among Russians of being a much worse place than it really is, and the officials in charge of the convicts are accused of a general line of cruelties which is foreign to their customary behavior. Recent visits to the Siberian penal settlements by intelligent travelers of different nationalities, have shown that the ill-treatment of convicts and the dismal character of existence in Siberia have been greatly exaggerated, and that both compare favorably with those in such settlements elsewhere. But to the prevailing Russian belief as to such matters may be laid somewhat of the revengeful and desperate frame of mind which results in nihilism. Again, the slight allusion which has been here made to

the course pursued by government officials in Russia, has in no wise fully presented the enormitics committed by thesc wretches in the name and by the authority of the emperor, who could not possibly control or even direct in such instances. The outrages and brutalities committed by agents of the government in distant parts of the empire, wcre done in perfect security, and went unpunished. It was hardly to be wondered at that the rude and illiterate Russian peasant, robbed of all that he hcld most dear, by the highest government official in his neighborhood, should accept from the learned the proposition that there was no God. Neither should it appear so astonishing that the educated and cultivated Russian whose sister or sweetheart was subjected to the knout, for the expression of liberal opinions, or sent by imperial order into that Siberia of whose horrors he had heard, should view not unwillingly the possibility of a regeneration of society which began with the assassination of emperors.

After Bakunin, the one who did most to propagate nihilistic ideas in Russia, was the novelist Tschernyschewsky, who edited a radical monthly until it was suppressed in 1862, and afterward wrote *What is to be Done*, a remarkable novel, which was forbidden circulation in Russia, but was printed in Berlin and in Switzerland. Disseminated thus through broadsides, periodicals, newspapers, handbills, and even fiction, the nihilist vicws have found many readers. The students in the universities have been apt and eager scholars in the new dispensation, mainly on account of mal-administration of their various colleges; but also from that volatile temperament and tendency to advanced speculative opinions which generally characterizes students everywhere. An absurd rule, that a knowledge of Greek and Latin should be the test in university and civil-service examinations, drove many students from the universities and into nihilism. In Russia the only field for the young man of education who is not noble, is the civil-service: commerce, the industries, and agriculture, offer them nothing; the priesthood is despised; therc is little or no busincss for the lawyer, and the army positions are reservcd to the nobility. Thus, to makc a classical education a *sine qua non* for entrance to the university, was to set up an impenetrable barrier; since the students, for the most part, are the sons of poor trades-people, priests, and small government officials, to whom Greek and Latin are impossible as preliminaries to a university education. Thrown out of their destined career, these young men had neither position, means of existence, nor prospects; and in very desperation they grasped at the delusive sublcties of nihilism. There are no means of knowing the number of nihilists; the organization seems wide spread, but careful investigators incline to consider the number as comparatively very small.

There remains only to recapitulatc a fcw of the leading events in the history of the various revolutionary attempts made by this organization since its foundation. As early as 1859 nihilistic societies began to be formed in Russia among the students of the agricultural college of Petrovski, near Moscow, who had adopted the materialistic views taught by Büchner in his *Force and Matter*, and those on socialism set forth by thc German, Max Stirner in his *Property and the Individual;* and who had read also, it it said, Buckle's *History of Civilization.* It was in this institution that the first political assassination occurrcd, when one of the students named Ivanoff was killed by the notorious Netchaïeff, who though an emissary of Bakunin, and of the chief committee of the nihilists, is accused of having been a common swindler, while he certainly proved himself to be an informer. This assassination, which did not happen until 1873, caused intense excitement, in the midst of which the perpetrator escaped to Switzerland, but only to be given up by the Swiss to the Russian government. He was tried in Moscow in 1874 with closed doors, and would have been executed, but that on account of the information which he afforded, his sentence was commuted to transportation for life and penal servitude in the mines of Siberia. By his confessions 183 persons were implicated, and these were all seizcd on the same day, May 20, 1875. Their trial lasted 18 months, terminating in Dec., 1877, when 99 of the accused were sentenced to penal servitude in Siberia, 36 subjected to police supervision for a certain number of years, and the remainder acquitted; those accused were chiefly sons and daughters of priests, trades-people, Jews, and small officials, and were charged with seeking to propagate nihilism among the lower classes. Many of them were young girls. The nihilists began to attract attention as a really formidable association about the time of the trial of Vera Sassulitch in 1878. Vera Sassulitch, a young woman 28 years of age, who had been under the surveillance of the government on account of the suspicion that she was concerned with the nihilists, attempted the assassination of gen. Trepoff, one of the chief of secret police, in July, 1877. The officer in question had ordered a political prisoner to be flogged for some act of disrespect to him personally, and Vera Sassulitch, as she averred, committed the act in order to force the government to take note of the fact. She was tried by a jury of educated men, eight of whom held government positions, and to the general astonishment, was acquitted, a result with which the Russian press and public showed themselves in full agreement. Gen. Trepoff was removed from his position, but was made gen. of cavalry. Vera Sassulitch left the country after the trial in 1878, but her case was brought before the supreme court of revision, and the acquittal canceled on the ground of informality. In Aug., 1878, gen. de Mezentzoff, the successor of gen. Trepoff, was stabbed at St. Petersburg while walking, and died the same day. This and other similar attacks were ascribed to the nihilists, who were manifesting remarkable activity in all directions. A secret association called the "National Government" issucd a circular in

April, 1878, containing a revolutionary programme, and calling upon the people to take up arms. Assemblages of the people in public places were now prohibited by a ministerial order. In a letter from Odessa to a Vienna newspaper, it was stated that there were several thousand members of the nihilist society in that city alone; that the organization had powerful supporters in the highest ranks of society; and that a lady who was one of the Russian fashionable leaders, had been arrested for being in correspondence with the chief of the nihilist committee at St. Petersburg. During Sept., 1878, a pamphlet entitled *Life for Life*, which was considered a manifesto of the nihilists, was published in St. Petersburg. Among other passages, it contained the following: "We are socialists. Our purpose is the destruction of the present economical organization and inequality which constitute, according to our convictions, the root of all the evils of mankind. The question of the political form is entirely indifferent to us." . . . "Our daggers will never be sheathed until our oppressors, who strangle and gag us, are expelled from the country; and a terrible vengeance will be taken if the Russian nation do not put an end to this mediæval barbarism." This declaration of socialism as a theory of governmental order, thus opposing the fundamental principle of nihilism, shows the heterogeneous elements and the blind fury of the whole movement. The assassination of gen. Mezentzoff was in fact avowed by the nihilists in their journal *Land and Liberty*, in which they alleged that he deserved death because he had trampled right under foot; had tortured his prisoners; persecuted the innocent; and in his official capacity had murdered by brutal ill-treatment, by hunger, thirst, and the rod, a number of persons whose names were given. On Feb. 22, 1879, prince Krapotchkin, governor of Kharkov, was assassinated by shooting; according to a nihilist circular, on account of certain inhuman acts against prisoners in his charge. Heyking, commander of gendarmerie at Kiev, was also among the victims of the nihilists, and on March 25, 1879, gen. Dreuteln, chief of the gendarmerie or third section, was shot at, and being missed, was warned that he could not long escape. The number and character of the persons assassinated or attacked by order of the committee of the nihilists was so great in the several towns of the empire, as to cause general alarm. The period of murders was followed by one of conflagrations. In the month of June alone, in 1879, 3,500 fires broke out in St. Petersburg, Orenburg, Koslow, Irkutsk, and Uralsk, destroying property to the amount of 12,000,000 rubles. Only 900 of these fires could be properly accounted for, and the remaining 2,600 were attributed to nihilist incendiaries. On April 2, 1879, an attempt to assassinate the emperor Alexander II. was made by Solovieff, who fired four shots at him from a revolver, but missed his aim. Solovieff was captured and afterward hanged. In Nov., 1879, an attempt was made to blow up the train by which the emperor was expected to arrive at Moscow; this attempt failed from a change of programme on the part of the emperor, who was not on the train that was actually blown up by a mine fired by one Hartman, who escaped. In 1867 an attempt had been made on the emperor's life while he was in Paris, riding in the Bois de Boulogne with the emperor Napoleon III. The assassin fired at him but missed him. The third effort was that of a man who entered the imperial apartments in disguise. The fourth, the terrible explosion at the Winter palace which killed several persons. The fifth and last occurred on the afternoon of Sunday, Mar. 13, 1881, and was a successful assassination. The emperor was returning from a parade in the Michel manege, and when near the Winter palace, a bomb was thrown beneath the imperial carriage, and exploded, breaking through the back of the vehicle, but without injuring the czar, who alighted to examine the extent of the damage. At that moment a second bomb was exploded close to his feet, shattering both his legs, and otherwise injuring him so that he died in less than two hours. The two assassins were immediately arrested, and within a few days others were apprehended for complicity in the affair. The funeral of Alexander II. took place on March 20, 1881. His son, the czarovitch, assumed the crown under the title of Alexander III. The assassination, which chilled the civilized world with horror, was openly rejoiced in at socialist meetings in various countries.

A proclamation of the executive committee of the nihilists, drawn up shortly after the attack on the emperor by the assassin Solovieff or Solowfew, sums up the latest known published demands of nihilism as follows :—"A representative democratic form of government; permanent parliaments, with full powers to regulate all matters of state; extension of self-government in the provinces; complete autonomy of rural communes; the land to be put into the possession of the people; means to be found for placing the factories in the hands of the artels or artisan guilds; transformation of the army into a militia; liberty of the press, and industrial combination." This ceases to be nihilism proper, and attempts reconstruction. It may mark a change in the direction of activity. Nihilism, too incoherent to be more than a blind frenzy, must soon destroy itself; but none can predict into what shape of revolution its fragments may be organized in some near future.

NIIGATA, a sea-port on the w. coast of Japan, at the mouth of the Shinano river, seat of the ken or prefecture of the same name, which comprises the island of Sado and the province of Echigo (6,000 sq.m; pop. 1,503,174); pop. of city, '78, 34,000. Petroleum, coal, various minerals and metals abound. The soil is good; rice, silk, tea, and the lacquer tree are cultivated. The city was founded in 1655, and opened as a port of foreign commerce by the treaties of 1858. It is well provided with schools, banks, news-

papers, post-offices; and its streets, which cross each other at right angles, are lighted at night. A rich inland trade is done on pack horses; and river steamers, sea-junks, and the native coasting-steamships, make this port an active place.

NIJ'MEGEN, NI'MEGUEN, the *Noviomagum* of the Romans (*magum* or *magen* being a Celtic word for a fixed dwelling), called by Tacitus *Batavorum oppidum*, in the middle ages *Numaga*, is the principal city of the district of Nijmegen, or the Betuwe, in the Netherlands province of Gelderland. Pop. 23,503, of whom three-fourths are Roman Catholic. It it pleasantly situated, 9 m. s. of Arnheim, on the several little hills, on the left bank of the Waal. Several of the streets are steep and narrow, passing up the Hoenderberg (*Hunnerberg*, or hill of the Huns), on which the Romans had a permanent camp in order to keep in subjection the country of the Bataviers, which lay between the Rhine and the Waal; others are broad and well built. On a height stood, till 1797, when it was demolished by the French, the castle of Valkenburg, said to have been built by Julius Cæsar. Here Charlemagne built a palace, and made the castle his residence. The site is now planted with trees, and forms a pleasant public walk overlooking the river and quay. On the brow of the hill there is a little sixteen-sided chapel or baptistery, which some think was originally a heathen temple of the Bataviers, and converted into a Christian church by Pope Leo III. in 799. On another eminence, where the chateau of the duke of Alva once stood, is a modern tower called Belvidere, from the summit of which there is an extensive view, including the rivers which branch off at the delta of the Rhine—viz., the Rhine, the Waal, and the Yssel, with the Maas flowing in the south. Nijmegen is strongly fortified and well garrisoned. The town-house, founded in 1554, is beautifully and antiquely fitted up within, and externally ornamented by several statues of emperors and kings of the Romans. St. Stephen's, or the great church, standing on the highest part of the city, is a handsome Gothic edifice in the form of a Greek cross, and before the reformation contained 30 altars. Nijmegen is a large market for cattle and agricultural produce, especially grain. Beer is extensively brewed, eau de cologne distilled, and there are factories for spinning and weaving; tin goods and earthenware stoves are manufactured.

Nijmegen is celebrated for the great peace congress of the European powers which was held here, and, Aug. 10, 1678, concluded a treaty between Spain and France; on Sep. 17, between France and the United Netherlands; and between the German empire and France, and the same empire and Sweden, Feb. 5, 1679.

NIJNI-NOVGOROD, an important government in the e. of great Russia, between the governments of Vladimir on the w. and Kazan and Simbirsk on the east. Area (according to the *Almanach de Gotha*), 19,390 sq.m.; pop.'79, 1,369,369. The surface is divided into two distinct portions by the Volga with its tributary the Oka. On the left, the northern bank of the river, the surface is flat; on the right bank it is hilly. As the soil is not very fertile, and there are few rich meadow lands, neither agriculture nor cattle-breeding is pursued extensively. The inhabitants are principally engaged in manufactures. The chief rivers are the Volga, Oka, and their numerous tributaries. There is communication by water with 24 governments, and with the Baltic, the White, and the Caspian seas. The northern districts of the government abound in forests, and here wooden utensils and tools are manufactured for the adjoining governments. There are several large iron-works, and the town of Gorbatof is the Sheffield of its district. Leather, especially that variety called Russian leather, is largely manufactured, and sheep and lamb skin dressing is a staple employment. On the right bank of the Oka are several ship-building and dock yards. The towns and villages are filled with an industrious and thriving manufacturing population. Capital, Nijni-Novgorod (q.v.).

NIJNI-NOVGOROD (Lower Novgorod), a famous commercial and manufacturing t. in the e. of great Russia, capital of the government of the same name, is situated at the confluence of the Oka with the Volga, 715 m. e.s.e. of St. Petersburg. The fortified portion of the town occupies a hill overlooking the Volga, and is surrounded with a wall. It contains the kreml or citadel, 2 cathedrals, and the palaces of the governors. The manufactures of Nijni-Novgorod include cloth, leather, steel goods, wax candles, tobacco, beer, pottery, etc., and ship-building. The trade of the town is of great commercial importanee, especially during the great annual fair which brings buyers and sellers from all climes between Germany and China. For the convenience of those frequenting the fairs, an enormous market-hall has been built, and sixty blocks of buildings for booths, containing 2,530 apartments separated by fire-proof walls. The numerous churches of the citizens are supplemented by a mosque and an Armenian church for the visitors. There are three annual fairs, two of them of minor account. The third, beginning at the end of July and continuing into September, is by far the greatest in the world. The normal population (12,441 in 1880) is then increased to near 350,000; and the value of the goods sold at the great fair of 1883 was about £26,000,000. Nijni-Novgorod, which is favorably situated for purposes of commerce, carries on a brisk trade during the whole season of navigation.

Nijni-Novgorod, founded in 1221, was devastated on several occasions by the Tartars; and in 1612, when it was on the point of falling a prey to Poland, Minin, the famous butcher of Nijni-Novgorod, collected an armed force here, which, under prince Pojarsky, drove the invaders from the capital. See Moscow. The prosperity of this town

dates from the year 1817, when the great fair was removed to Nijni-Novgorod from Makarief, on account of the destructive fire which broke out in the latter place.

NIJNI-TAGILSK, a t. of Russia, in the government of Perm, amid the Ural mountains, 150 m. e. of Perm. It is one of the most important mining towns in Russia, or in the world. The soil in the immediate vicinity is everywhere rich in iron, copper, gold, and platina; not far off is the famous magnetic mountain Blagodat, 1422 ft. high. Akimfi Demidoff (q.v.) established the first foundry here in 1725. The yield both of iron and copper is immensely large. Pop. 35,000.

NIKKO, the seat of the mortuary shrines of Iyeyasu, and of Iyemitsu, the founder and the third of the line, respectively, of the Tokugawa family of shōguns (tycoons) who ruled Japan from 1603 to 1868. The wonders of nature and art combine to make it the goal of many thousands of pilgrims annually, and of all foreign tourists who have time to spare. As a holy place, it began to win reputation even in the 8th c., but the present magnificent shrines, masterpieces of Japanese art, date from 1617. Hachi-ishi is the village of hotels at the mountain foot. Nantaizan is the loftiest peak of the range. The lake Chiuzenji and the lofty water-fall of Kiri-furi (tumbling mist) are striking features famous in literature and art. The chief priest of the shrines was always a prince of the imperial blood, and an annual envoy was sent by the mikado to pay honor to the memory or Iyeyasu. Works of art in wood-carving, bronze, granite, and other stone, and gifts from daimios and pilgrims, from Holland, Loo Choo, Corea, etc., make this one of the historic spots for travelers of every nation.

NIKOLAÏEF, a t. of s. Russia, in the government of Kherson, 40 m. n.n.w. of the town of that name, stands 20 m. above the mouth of the Bug, and at the confluence of that river with the Ingul. It was founded in 1790, and its situation was found so convenient for ship-building purposes that it soon became the center of naval administration of the Black sea. It has broad, straight streets, containing several barracks, a cathedral, schools for pilots, hospitals, an observatory, and an arsenal. In the first half of the present century about 10,000 men were employed at Nikolaief in ship-building and other naval operations. Since the opening of the railway system, by which it has connection with Moscow, etc., the population and trade have greatly increased. Pop. '80, 82,805.

NIKOLAEVSK, chief t. of the Amoor territory, in e. Siberia, situated on a well-wooded plateau on the left bank of the Amoor, and 25 m. from its mouth, 6,750 m. e. of St. Petersburg. The approaches to the town are defended by four batteries. The Amoor is here a mile and a quarter broad, but the landing place is available only for small craft, all large vessels being compelled to lie in mid-stream. Pop. '80, 5,314.

NI'KOLSBURG, or MI'KULOV, a t. of Austria, in the s. of Moravia, 27 m. s. of Brunn, lies at the foot of the Pollaver hills, famous for their rich red wines. The town belongs to the princely family of Dietrichstein. It has several steam-mills, and cotton and silk factories. In the middle of the town, upon a rock, stands the castle of the Dietrichsteins, with a library of 20,000 volumes, and a vat in the cellars capable of containing 2,000 eimers (more than 30,000 gallons). Pop. '80, 7,642, of whom more than half are Jews.

NIKON, Patriarch of the Russian church, 1605–81; b. near Nijni-Novgorod, Russia, of humble parentage; received his education from a monk in the monastery of St. Macarius. He afterward became a priest, but was so much attached to the monastic life that he entered the hermitage of Anserche, on the island of Solowetz, in the White sea. He separated from his wife, with whom he had lived ten years, and persuaded her to enter the convent of St. Alexis at Moscow. His fellow-monks desiring to exchange their wooden church for one of stone, Nikon and Elizar (the founder and head of the hermitage), were sent to Moscow to procure contributions for the purpose. Elizar appropriated the money obtained to his own use. Nikon remonstrated; his associate became his enemy. Nikon, unable to endure his persecution, left the island in a small boat, and after exposure to great peril he reached the island of Kj, at the mouth of the Onega. Here he erected a wooden cross, and vowed to build a monastery on the spot, which vow he fulfilled. In 1666, having occasion to go to Moscow on business for the monastery of which he was abbot, the czar Alexis Micailovid appointed him archimandrite of the Novaspasky convent at Moscow. He used his influence with the czar in behalf of poor widows, orphans, the persecuted, and oppressed. In 1648 he was made metropolitan of Novgorod, and became much endeared to the people. In 1650 he quelled a violent popular insurrection at the peril of his own life, and then obtained permission to go to the prisons and release those who had been unjustly incarcerated, as well as real criminals who were sincere penitents. He showed great kindness to the poor. He preached to crowds, revised the liturgy of the Russian church, and caused the clergy to perform divine service with more devotion. On the death of the patriarch Joseph, Nikon in 1652 was appointed patriarch. In 1654–55 he called a council of the church to take measures for making the church books conform to the Greek originals. The council compared with the Septuagint the Slavonic versions, some of which were five centuries old, and found them correct, and that the errors in the books in common use were owing to the carelessness of transcribers. A new edition, made at Moscow and set forth by Nikon, created a division in the church. Nikon endeavored to root out all abuses of the hier-

archy, to promote temperance, setting the people an example of abstemious habits. Sacred pictures to which he believed the people paid idolatrous veneration he removed. The baptisms of the western church, then and now considered by the Greek church invalid, he sanctioned. Education, begun by Ivan the terrible but interrupted by war, he encouraged. The printing press was again set up. Greek and Latin were now for the first time taught in the schools. He made also many useful changes in the church service. The greatest reform was the revival of preaching. From Nikon was first heard, after many centuries, a living, practical sermon. These changes greatly agitated the church, but the czar's favor did not fail, until in 1658 his enemies succeeded in alienating the czar from him, and Nikon retired to the monastery of the Resurrection of Christ that he had himself built. The misunderstanding between him and the czar increasing, and Nikon refusing to return to Moscow, a council was called in 1667 to consider his case, under the presidency of the eastern patriarch; and on Dec. 12 of that year he was deposed, and banished as a common monk to the Bielvozersky Therapontic monastery. The czar Feodor Alexievich allowed him to remove to the monastery of the Resurrection of Christ, but on the journey thither he died. He was buried in that monastery in the presence of the czar; his absolution was obtained from the eastern patriarch and he was again enrolled in the list of Russian patriarchs. "Nikon," says Stanley, "rests all but canonized in spite of his many faults, and in spite of his solemn condemnation and degradation by the nearest approach to a general council which the eastern church has witnessed since the second council of Nicæa. He rests far enough removed from the ideal of a saintly character, but yet having left behind him to his own church the example of a resolute, active, onward leader; to the world at large, the example, never without a touching lesson, of a sincere reformer recognized and honored when honor and recognition are too late." Many historians think that with more prudence he might have saved the Russian church from a schism which still exists, and that he lacked the wisdom and policy which are essential to men in high places of trust. In 1664 Nikon sent to the east and purchased 500 MSS. of Greek books dating from the 11th to the 17th century. He also made a collection of the Russian chronicles, the Stufen books, and the Greek chronologists, which reaches to the year 1630, and is known by the name of the *Chronicle of Nikon.* The academy of sciences of St. Petersburg published a fine edition of this in 8 vols. in 1767–92. He wrote also several theological treatises, of which the following are the most important: *A Table of Dogmatic Studies; Sermons; The Intellectual Paradise,* containing a description of the monasteries of mount Athos and of Valdaï; *A Canon,* or book of prayers. Stanley in his *History of the Eastern Church,* Palmer in the *Patriarch and the Tsar,* Eckardt in *Modern Russia,* and the *London Review,* have given a particular account of the patriarch Nikon.

NIKO'POL, a thriving t. of s. Russia, in the government of Ekaterinoslav, on the right bank of the Dnieper, about 200 m. from its mouth, in lat. 47° 33′ north. Nikopol is the center of an extensive agricultural district, the produce of which is here shipped to Odessa. Between Nikopol and the port of Odessa there is regular communication by steamboat. The natural advantages of Nikopol promise to make it one of the principal commercial centers on the Dnieper. Pop. '80, 9,706.

NILE (*Nilus*), called by the Egyptians *Hapi Mu* (the genius of the waters), and by the Hebrews *Sihor* (the black), the river of n.e. Africa formed by the union of the Bahr-el-Abiad (the White or true Nile) and the Bahr-el-Azrek (Blue Nile). Capts. Speke and Grant discovered that the first of these, the true Nile, flowed out of the lake Victoria Nyanza, which extends from about lat. 0° 20′ n., to 2° 40′ s., and from long. 31° 40′ to 35° e., and is 3,800 ft. above the level of the sea; and the river Shimiyu, the largest tributary of this lake, flowing into its southern extremity, must now be regarded as the most southerly source of the Nile. The second, the Blue Nile, has its source in Abyssinia, in lat. 10° 59′ n., and long. 36° 55′ east.

The White Nile, from its outfall from the Victoria Nyanza at the "Ripon falls," lat. 0° 20′ n., long. 33° 30′ e., flows n.w. and w. for about 230 m., till it enters the lake Albert Nyanza, within 30 m. of its northern extremity, where the river again emerges. On issuing from the Victoria Nyanza the Nile rushes down due n. like a mountain-torrent, running off at last into long flats, and expanding so as to form what is called Ibrahim Pasha lake. In this part of its course the river is navigable, and continues to be so until it reaches the Karuma falls. From these falls to the Murchison falls (120 ft. in height), near the Albert Nyanza, the river forms a series of rapids. Between the two Nyanzas the Nile is known as the Victoria Nile, or Somerset river.

After leaving the Albert Nyanza, the Nile begins its northward course to the Mediterranean, and has no further lake expansion. Between the Albert Nyanza and Gondokoro (Ismailia), in 4° 55′ n. lat., and 31° 51′ e. long., 1500 ft. above the sea, the Nile river descends several hundred feet in a series of rapids and cataracts. For about 500 m. after Gondokoro the Nile flows very tortuously, first in a north-westerly and then in a north-easterly direction, and is joined, in about lat. 9° 15′ n., long. 30° e., by its first great affluent, the Bahr-el-Gazal, which joins the Nile from the w. with hardly any perceptible current. The second tributary is the Giraffe river, about one-third the volume of the Nile at its point of junction, long. 31° east. From the Bahr-el-Gazal the Nile flows in a due easterly direction for about 80 m., then s. for 30 m., when it is joined by its third

tributary, the Sobat river, from the east. The Sobat is full and navigable. Between this and the town of Khartoum, a distance of about 460 m., the Nile runs in a northerly direction, with a width of from one to two m., and is joined by several streams from the e. side.

Khartoum, the capital of Nubia, is situated at the confluence of the Bahr-el-Azrek (Blue Nile) and the Bahr-el-Abiad (White Nile), 1188 ft. above the sea level, in lat. 15° 35′ n. long., 32° 30′ east. The Bahr-el-Azrek, long supposed to be the main branch of the true Nile, is formed by the junction of the Abai and the Blue river. The Abai has its source in Abyssinia, 50 m. from lake Dembea, which it enters from the s.w.; emerging on the s.e. of the lake, it flows for about 90 m. in that direction, when it describes a semicircle round the peninsula of Godjam, and continues north-westerly for about 150 miles. It is here joined by the Blue river from the s., and from this point the Blue Nile flows n.w. to Khartoum, receiving from the e. two large rivers running nearly parallel to each other, the Dender and the Rahad or Shimfa. From Khartoum, the united stream flows n. for about 60 m., passing the town of Halfaia and the ruins of Meroë to the first cataract, and thence n.e. past Shendy (q.v.) to its junction with the Atbara, which enters the Nile at El Damer, lat. 17° 45′ n., long. 34° east.

The Atbara, also called Bahr-el-Aswad, or Black river, because it carries down with it the greatest amount of the black mud and slime that manures and fertilizes Egypt, is the last tributary received by the Nile. The Goang seems to be the direct source of the Atbara. It rises in the heights to the n. of lake Dembea. About 150 m. from its source it receives the Basalam river, and about 30 m. further on, the Takazze or Setit river, both from the east. The Takazze has a far greater volume of water than either of the preceding rivers. It rises in the Samen mountains, round which it flows first easterly, then n., till in about lat. 13° 30′ n., long. 38° 50′ e. it turns n.w., and then almost due w., joining the Atbara at right angles. It has many tributaries.

From its junction with the Atbara the Nile continues to flow northerly through the populous and fertile district of Berber, full of villages, and then enters the desert. Turning westwards in lat. 19° n., it forms the large island of Mograt, and makes a curve to the south-westward, known as the "great bend," in which there are two cataracts. Entering Nubia, the Nile resumes its northwesterly course, with narrow strips of cultivated land on each bank. Here it forms another cataract, and bends round to the n.e. with a fifth cataract, in lat. 21° 40′ north. After this the valley of the Nile narrows, and at Assouan, in lat. 24° 10′ n., it forms the last cataract in descending.

From Assouan to the sea the average fall of the Nile is two inches to a m., and its mean velocity about three m. an hour. It waters and fertilizes the whole length of the land of Egypt. The delta of the Nile extends from lat. 30° 10′ n. to 31° 30′ n., and has a base on the Mediterranean of about 150 miles. In it the Nile spreads out into numerous streams, the two principal being those of Rosetta and Damietta. The total length of the Nite, from its exit from the lake to the sea, is about 3,300 m., measured along its course, or about 2,200 m. direct distance.

A feature peculiar to the river of Egypt is that from its junction with the Atbara, to its mouth, a distance of upwards of 1500 m., it receives no affluent whatever, and yet it is able to contend with the burning sun, and scarcely less burning sands of Nubia. With the ancient Egyptians the river was held sacred: the god Nilus was one of the lesser divinities. Its annual overflow is one of the greatest marvels in the physical geography of the globe for it has risen to within a few hours of the same time, and to within a few inches of the same height, year after year for unknown ages. At Khartoum it begins to increase early in April, but in lower Egypt the inundation usually begins about the 25th of June, and attains its height in about three months. It remains stationary about twelve days, and then subsides. The cultivable soil of Egypt is wholly dependent on the rise of the Nile, and its failure causes a dearth; for, virtually, the country has no rain. Continuous south wind brings a good, and north wind a bad year. During a good inundation the rise is about 40 ft. on the tropic of Capricorn, 36 ft. at Thebes, and 4 ft. at the Damietta and Rosetta mouths in the Delta. If at Cairo the rise is only 18 or 20 ft. there is a scarcity; up to 24 ft., a deficiency; 25 to 27 ft. is good: more than that causes a flood, and fosters plague and murrain. During the inundation the whole valley is covered with water, from which the villages rise like islands, protected by dikes. Of late years the overflow has been greater than the average of many centuries. The rise and fall of the trunk stream of the lower Nile is owing to the periodicity of the rains on the mountains of Abyssinia and in the basin of lake Nyanza, where, on the equator, it rains, more or less, all the year round, most copiously during the equinoxes. The banks of the Nile swarm with birds, among which are vultures, cormorants, geese, pelicans, quails, and the white ibis; and its sweet, soft waters teem with fish. The average amount of alluvium brought down by the river is estimated at a deposit of 4½ inches in a century—by some it is made as high as 6 inches; the greater part of it is brought down by the Atbara

The question of the source of the Nile is at once the oldest and the most recent of geography. That the sources of a river, at whose mouth one of the earliest and most civilized peoples was established, should have been so long veiled in obscurity is unparalleled in geographical research. The want of success in exploring the upper basin of the Nile may be attributed to the great length of the river, to the difficulties which beset the

traveler in the physical nature of the countries he must pass through, the climate, and the jealousy, ignorance, and barbarism of the native tribes. This problem of centuries may now be regarded as satisfactorily solved; for the question whether there may not yet be found important feeders of the White Nile carrying back its source to a still greater distance in the interior is practically excluded by Stanley's exploration of the Lualaba or Congo basin. The journeys of Krapf and Rebmann to the foot of Kilimandjaro and the other snowy mountains in the e. of Africa, believed by them to be the ancient "mountains of the moon," and the explorations of the White Nile, pointed to the conclusion that it was among these mountains that the sources of the great river would ultimately be discovered.

There was, however, another theory. Rumors gathered from the natives pointed to lakes in the regions s. of the equator as the true sources of the Nile. To explore this country the distinguished traveler, capt. Richard Burton, accompanied by capt. Speke, started from the Zanzibar coast in 1857. Their enterprise was so far successful that they discovered lake Tanganyika, in lat. 5° s., long. 36° e., and a large crescent-shaped mass of mountains overhanging the northern half of the lake, and 10,000 ft. high, considered by capt. Speke to be the true Mountains of the Moon. On the shores of lake Tanganyika Burton was laid up by illness, and his companion, after surveying the northern portion of the lake, left him there to recruit his health, while he (Speke) proceeded northwards to discover another huge "nyanza" or lake, of the existence of which he was informed by the natives. This he accomplished on Aug. 3, 1858, when he discovered the southern end of the Victoria Nyanza (q.v.). In his journal he says of this immense sheet of water: "I no longer felt any doubt that the lake at my feet gave birth to that interesting river, the source of which has been the subject of so much speculation and the object of so many explorers."

In 1861 capt. Speke, taking with him capt. Grant, returned to the lake region. The expedition approached the Victoria Nyanza again from the coast of Zanzibar; and the first place from which they obtained a view of it, during the second expedition, was the town of Mashonde on its western side. Thence they pursued their way along the shore northwards. Crossing the equator, they reached streams which are said to flow out of the lake, and further on, in the center of its northern coast, what they considered to be the parent stream of the Nile, 150 yards in breadth, flowing over rocks of an igneous character, and forming falls 12 ft. high, which capt. Speke christened the "Ripon falls," in honor of the president of the royal geographical society at the time of his starting on the expedition.

In the kingdom of Karagwé capt. Speke found a very superior negro race, much better disposed to strangers than any of the tribes he had formerly passed through. The country occupied by this race, and that of Uganda, stretches along the Nyanza, and covers half of its western and northern shores, the Uganda being bounded on the e. by the main stream of the Nile. North of it lies the kingdom of Unyoro, where the dialects belonging to the language of s. Africa, and which up to this point are used by the various tribes, suddenly cease, and give place to those of the language of n. Africa.

At Gondokoro Speke and Grant were met by Mr. (now sir Samuel) Baker, who had come from Cairo to their relief. Baker, accompanied by his heroic wife, pushed still southwards, and had the happiness of discovering, in 1864, another great lake, which he called the Albert Nyanza. In 1869 he undertook a second great expedition, of a military character, at the expense of the pasha of Egypt, to suppress slavery in the upper regions of the Nile; and has reduced under the sway of that ruler the whole valley of the river as far as the Victoria Nyanza. Sir Samuel returned in Sept., 1873.

Meanwhile Dr. Livingstone had been working for many years, from another quarter, at the solution of the great African problem—the true source of the Nile. In 1866 he began the great journey from which he was destined never to return. Starting from the Rovuma river, in the far s., he passed round the s. end of lake Nyassa, proceeded northward, exploring the lakes Bangweolo and Moero; and in 1869 reached lake Tanganyika, now known to send its outflow towards the Congo, but which he sought in vain to connect with the Victoria Nyanza. In 1871 he was found by Mr. Stanley at Ujiji, on lake Tanganyika, and it was then his opinion that neither Tanganyika, nor the Albert Nyanza, nor the Victoria Nyanza was the true source of the Nile, nor any of the feeders of these lakes; but that it was to be sought in a basin lying westward of them, through which flow three large rivers, all called Lualaba, and which unite to form another great lake, which he called Lincoln. Out of this a river runs northward, which he conceived to be the main branch of the Nile. Geographers at home generally believed that Livingstone was mistaken, and had struck instead upon the source of the Congo; but the death of the great traveler before the completion of his explorations left the problem unsolved. It was not until Mr. Stanley in 1876–77 followed the course of the Lualaba to its mouth that this stream was definitely proved to be identical with the Congo. Mr. Stanley's explorations in 1875, ere he struck the Lualaba, have given us more accurate information as to the size and shape of the Victoria Nyanza (see NYANZA), and as to its affluent, the Shimiyu. See AFRICA.

NILES, a city in Berrien co., Mich., on the St. Joseph river, at the head of navigation; on the Michigan Central railroad, 93 m. e. of Chicago; pop. of city, '80, 4,197.

Niles was settled in 1828; it is furnished with water-power by a dam built across the river. There are numerous mills of various kinds, foundries, and machine-shops, a national bank, public schools, weekly newspapers, and 8 churches. The outlying districts produce large quantities of lumber, grain, and fruit, which are brought here for shipment.

NILES, Hezekiah, 1777–1839; b. Penn.; received an ordinary education and learned the printer's trade. In 1800 he became a member of the firm of Bonsall & Niles, printers and publishers, in Wilmington, Del. The business was not successful, and Niles for several years was a newspaper contributor and editor, being for six years the managing editor of a Baltimore daily. In 1811 he began the publication of *Niles's Register*, and continued it for 25 years. This weekly paper contained very valuable articles on political and financial subjects, and historical papers of great importance. Niles republished the work in book form (32 vols.) in 1828, and it was continued after his death by W. O. Niles, Jeremiah Hough, and George Beattie until 1849. Niles also published *Principles and Acts of the Revolution*, 1822. He was a strenuous advocate of a protective tariff.

NILES, John Milton, 1787–1856; b. Hartford, Conn., and was in early life a farmer. His education was mostly self-acquired, and before he was of age he began the study of law. After his admission to the bar he spent two years in Vermont, New York, and Pennsylvania, but in 1817 returned to Hartford and there founded the *Times*, a democratic newspaper, with which he was connected as editor and contributor for 30 years. He was for some years a county judge, was a member of the general assembly, and in 1829 was made city postmaster by president Jackson, resigning the position on his appointment to fill a vacancy as U. S. senator, 1835–39. He was made postmaster-general in 1840, and in 1843 was elected U. S. senator for a full term. He published, besides many addresses, orations, and speeches: *History of South America and Mexico, and a View of Texas* (1839); *Life of Commodore Oliver H. Perry* (1820); and other books.

NILES, Nathaniel, 1741–1828; b. R. I.; after graduating at the college of New Jersey in 1766, studied medicine and law, and afterwards theology with Dr. Bellamy, and taught school in New York city. He obtained a license to preach in Congregational churches, and settled in Norwich, Conn. He was confined to no pastorate, but preached as occasion offered, and was accounted earnest and zealous. He was versed in mechanics, and invented a process by which bar-iron could be made into wire by the use of water-power; first employed in a wool-carding factory. He was speaker of the house of representatives of the legislature of Vermont in 1784, having removed to West Fairlee, Orange co., in that state, and was prominent in the politics of his time. At the close of the revolutionary war he was a candidate for national honors, and was member of congress, 1791–97, and a judge of the supreme court. He was chosen presidential elector for six successive administrations, and was appointed one of the censors on the revision of the state constitution. During the revolutionary war he composed a war-song, *The American Hero*, which became very popular. He contributed a number of valuable essays to the *Theological Magazine*, and published several sermons, lectures, and essays. In 1773 he published *Two Discourses on Confession of Sin and Forgiveness*, and *Four Discourses on Secret Prayer*. In 1777 there appeared two sermons entitled *The Perfection of God the Fountain of Good*. In 1809, a *Letter to a Friend*. He wrote a *History of the Indian Wars*.

NILES, Samuel, 1674–1762; b. on Block Island, R. I.; graduated at Harvard university, 1699; became a Congregational minister; preached in Kingston, R. I., from 1702 till 1710; was installed in May, 1711, as pastor of Second church, Braintree, Mass., where he remained till his death. He published *A Brief and Sorrowful Account of the Present Churches in New England*, 1745; *God's Wonder-working Providence for New England in the Reduction of Louisburg*, a poem, 1747; *Vindication of Divers Important Doctrines*, 1752; *Scripture Doctrine of Original Sin*, 1757; and was the author of an unfinished *History of the French and Indian Wars*, published in Massachusetts historical collection, 3d series, vol. vi.

NILES, William Woodruff, s.t.d. See page 890.

NIL-GHAU. See Nyl-Ghau, *ante*.

NILOM'ETER (the measurer of the Nile), the name of two buildings existing in Egypt, one in the island of Rhoda, opposite to Cairo, the other at Elephantine, close to Assouan, in 24° 5′ 23″ n. lat. The first consists of a square well, in which is placed a graduated pillar of marble, and is called a *mekkïas* or measure; the pillar contains 24 *devakhs* or cubits, each of which measures 21.386 in., or according to Greaves, 1824 ft., and contains 24 digits; but in its present state it does not appear to have been intended to mark a rise of more than 16 cubits. This pillar is exceedingly slender. The building formerly had a dome, bearing a Cufic inscription, dated 847 A.D., and is said to have been erected by the calif Mamun, or his successor, Wathek Billáh. The first-mentioned monarch is said to have erected another nilometer at the village of Banbenouda, in the Saeed, and to have repaired an old one at Ekhmin. The calif El Motawukkel built the present one. The mode of calculating the increase at the nilometer is rather complex, and to a certain extent arbitrary, political and financial reasons rendering the process a mystery even to the natives. At the present day the Nile is supposed to have

risen to 18 cubits when the canals are cut; this is the height of the lowest inundation; 19 cubits are considered tolerable, 20 excellent, 21 adequate, and 22 complete; 24 are ruinous. In the time of Edrisi, however, 16 cubits were considered sufficient. The object of these nilometers was to measure the amount of taxation to be imposed on the country. The nilometer at Cairo is, however, much more recent than that existing at Elephantine, which consists of a staircase between two walls descending to the Nile. One of these walls has engraved on it a series of lines at proper intervals marking the different elevations to which the river rose under the Cæsars. The cubits here are divided into 14ths or double digits, and measure 1 foot 8.625 inches. This nilometer is described by Strabo. The probability is that many nilometers existed in the days of the Pharaohs, probably one in each city. In the days of Mœris 8 cubits were sufficient, but 15 or 16 were required in the time of Herodotus, 456 B.C., and this was the mean under the Romans. According to Pliny, if the inundation did not exceed 12 cubits it produced a famine, 13 starved the country, 14 rejoiced it, 15 was safety, and 16 delight, and this number is symbolically represented by the number of children playing round the river god on statues of the Roman period. The oldest nilometer appears to have been erected at Memphis, and it was transferred by Constantine to a church in the vicinity of the Serapeium; but Julian sent it back to this temple, where it remained till its destruction by Theodosius. At the present day the rise is watched for with anxiety, and proclaimed by four criers.—Herodotus, ii. 13; Strabo, lib. xvii.; Wilkinson, *Topogr. of Thebes*, pp. 311–17. Hekekyan Bey, *Siriadic Monuments* (Lond. 1863), p. 145.

NILS'SON (ROUZAUD), CHRISTINE, b. Sweden, 1843. At an early age showed a taste for music, and although her parents were in humble circumstances, became quite proficient on the violin, learned the flute, and attended fairs and other places of public resort, at which she sang, accompanying herself on the violin. While performing in this manner at a fair at Ljungby in 1857, her voice attracted the attention of F. G. Tornérhjèlm, a gentleman of influence, who sent her to Stockholm, where she received instruction from Franz Berwald. She made her début at Stockholm in 1860, and then went to Paris to continue her musical education, under Masset and Wartel. In 1864 she appeared at the Theâtre Lyrique of Paris, as Violetta in *Traviata*, with such success that she was engaged to sing for three years. She made her first appearance in London in 1867, where she immediately became a favorite. In 1868 she sang the part of Ophelia in the opera of *Hamlet*, by Ambroise Thomas, at the Grand Opera in Paris. During the same year she sang in England at the Handel festival at the Crystal palace. In 1870 she came to America, appearing in concerts and operas, and achieved popularity wherever she was heard. She was married at Westminster abbey, in 1872, to Auguste Rouzaud, a merchant of Paris. After creating great enthusiasm at St. Petersburg, she returned to America with the Strakosch Italian opera troupe, containing such artists as Campanini-Maurel, Capoul, Del Puente, and Annie Louise Cary. She appeared as Elsa in Wagner's *Lohengrin*, and sang during the same season in opera with Pauline Lucca. She had retired from the operatic stage for some years, when the failure and death of her husband, 1882, caused her return for a brief season, 1883–84.

NIMBUS, in art, especially in sacred art, is the name given to the disc or halo which encircles the head of the sacred personage who is represented. Its use is almost universal in those religions of which we possess any artistic remains—the Indian, the Egyptian, the Etruscan, the Greek, and the Roman. In the Hebrew scriptures we trace, in the absence of representations, the same symbolized idea in the light which shone upon the face of Moses at his return from Sinai (Exod. xxxiv. 29–35), and in the light with which the Lord is clothed as with a garment, Ps. ciii. 1, Vulg. (civ. 1, auth. vers.); and in the New Testament in the transfiguration of our Lord (Luke ix. 31), and in the "crowns" of the just, to which allusion is so often made (2 Tim. iv. 8; 1 Peter v. 4; Apoc. iv. 4). Nevertheless, the nimbus, strictly so called, is comparatively recent in Christian art, appearing first toward the end of the 5th century. Later, in Christian art, it became almost a necessary appendage of all representations of God or of the saints. Its ordinary form is the circular or semicircular; a form, indeed, in which later symbolists discover an emblem of perfection and of eternity; but the nimbus of the Eternal Father is often in the form of a triangle, and that of the Trinity an emanation of light, the rays of which form the three arms of a cross. The nimbus of the Virgin is sometimes a simple ring, and sometimes a crown or diadems; occasionally it is encircled by an ornamental border, on which twelve stars are sometimes represented. Her nimbus, as well as that of the divine persons, is commonly of gold; but that of the Virgin Mary is occasionally in colors, as blue, red, purple, or white. The nimbus of the saints is ordinarily the semicircle or lunula. Dedron mentions the curious instance of a picture of the traitor Judas *with a black nimbus!* In later art the nimbus became lighter and more aërial, melting, as it were, into the picture; and in Raphael's saints it occasionally fades into the very faintest indicatioa of a golden tinge around the head. In connection with the nimbus may also be mentioned two analogous forms—the *aureole* and the *glory*. The former is an illumination surrounding, not the head only, but the entire figure. If the figure be upright, the aureole is commonly oval, when it is called the *vesica piscis*, and is supposed to contain an allusion to the *icthys*. With a seated figure it becomes circular, and is occasionally divided by radiating bands, in the form of a

wheel; sometimes it taks a quatrefoil form. It is commonly of gold, but occasionally also is in colors. The glory is a combination of the nimbus and the aureole, and is chiefly seen in Byzantine pictures, and those of the early South German school.

NIMEGUEN. See NIJMEGEN.

NÎMES (anc. *Nemausus*), a t. of France, capital of the department of Gard, stands in a fertile plain surrounded by vine-clad hills, 30 m. n.e. of Montpellier, with which it is connected by railway. It consists of the town proper (ill built and dirty), and of three handsome suburbs. In the vicinity are the beautiful remains of the Roman aqueduct called the *Pont du Gard*. The chief of the modern edifices are the *Palais-de-Justice*, the theater, and the hospitals. The *Grande Place* is embellished with one of the most magnificent fountains in France. Nîmes contains numerous and variously-constituted educational institutions, an important public library, Maria Theresa's museum (in the *Maison Carrée*), a museum of natural history, etc. It is the general entrepôt for the silks produced in the south of France, and its manufactures are principally silk and cotton fabrics. More than 10,000 looms are constantly in operation in the city, and about 6,000 in the immediate vicinity. Shawls, handkerchiefs, lace, brandy, wines, etc., are made. Within the town are numerous and beautiful Roman remains, the chief of which are the amphitheater; the *Maison Carrée* (square house), a fine specimen of Corinthian architecture; a temple and fountain consecrated to Diana; *La Tour Magne* (great tower); the baths, and two Roman gates. See Menard's *Antiquités de Nîmes* (1833), and his *Histoire de Nîmes* (7 vols. 1875). Pop. '81, 62,549.

Previously to the Roman invasion, Nîmes—which is supposed to have been founded by a colony from Massilia (Marseille)—was the chief city of the Volcæ Arecomici. It flourished under the Romans, and was one of the great cities of Gaul. It surrendered to the rule of the Visigoths between 465 and 535, and afterwards to that of the Franks. Subsequently it became a possession of Aragon, but was finally restored to France in 1259 by the treaty of Corbeil. The inhabitants adopted Calvinism in the 16th c., and on many occasions suffered severely for their religious principles. In 1791 and and 1815, bloody religious and political reactions took place here.

NIMROD. See BABYLON.

NIMRUD is the present Arabic name for the site of an ancient Assyrian city on the e. bank of the Tigris, about 20 m. below Mosul, thought by many to be Calah spoken of in Gen. x. It is one of a group of cities which anciently were known as Nineveh, or which clustered around the metropolis of that name. The ruins are in the fork formed at the junction of the Tigris and the Zab, are about 5 m. in circumference, and were inclosed by a wall, having towers and gates, the remains of which extend around nearly the whole distance. Excavations made by Layard, Rassam, Loftus, and George Smith, laid open the following buildings: 1. A tower on the n.w. corner of the mound, extending more than 160 ft. and faced with stone to the height of 20 ft.; 2. Temples around the tower; 3. The n.w. palace, 350 ft. square; 4. The center palace, s. of the former; 5. The s.w. palace, built with materials from the n.w. and center; 6. The s.e. palace; 7. The temple of Nebo. According to the inscriptions the city was built B.C. 1320, and having been destroyed in troublous times, was afterwards rebuilt, and continued a royal residence about 170 years. Shalmaneser II., who became king, B.C. 860, conquered the country of the Euphrates, and advancing into Syria met and defeated a confederacy of kings among whom were Benhadad of Damascus, Ahab of Israel, and Baasha the Ammonite. About 720 B.C. Calah ceased to be a capital of the empire, and was finally destroyed by the Medes and Babylonians when they conquered Assyria.

NINA, LORENZO, Cardinal. See page 890.

NINDE, WILLIAM X., D.D. See page 890.

NINEVEH, or NI'NUS, a very ancient and famous city, the capital of the great Assyrian empire, said in scripture (Gen. x. 11) to have been founded by Ninus or Nimrod. It was situated on the e. bank of the Tigris, opposite to the present Mosul. According to the accounts of the classic writers, the city was of vast extent, 480 stadia, or more than 60 m. in circumference. Its walls were 100 ft. high, broad enough for three chariots, and furnished with 1500 towers, each 200 ft. in height. In the *Book of Jonah* it is described as an "exceeding great city of three days' journey," and one "wherein are more than six-score thousand persons that cannot discern between their right hand and their left hand" (children or infants are probably meant). After having been for many centuries the seat of empire, it was taken after a siege of several years and destroyed by the united armies of the Medes under Cyaxares, and the Babylonians under Nabopolassar, about 625 B.C. When Herodotus, not quite 200 years afterwards, and Xenophon visited the spot, there remained only ruins. Tradition continued to point pretty accurately to the site of Nineveh; but it is only of late years that actual explorations have been made. For an account of these see ASSYRIA.

NINGPO, a department in the province of Chekiang, China, comprising the city of that name, the Chusan group of islands, and the cities of Tsike. Funghwa, Chinhai, and Tsiangshan. The port of Ningpo is situated at the confluence of two small streams, in lat. 29° 55′ n., long. 121° 22′ e., 12 m. from the sea, on an alluvial flat of extreme fertility, intersected by a net-work of rivulets and canals. Its walls are 5 m. in circumference, about 25 ft. high, 22 ft. wide at the base, and 15 at the top, with six double gates.

NINEVEH AND ASSYRIA.—1. Nisroch and the holy tree. 2. Feroher. 3. Dagon. 4. Portal figure from Khorsabad. 5, 6. Nimrud deities. 7. Astarte. 8. Fire-altars. 9. King Sanherib. 10. Cuneiform inscriptions. 11-14. Scenes from Assyrian life. 15. Axe. 16. Basket. 17. Inscribed cylinder. 18. Ring. 19. Stool.

As is the case with all the cities in this part of China, Ningpo is permeated by canals communicating with a moat nearly surrounding the walls, and with the adjacent country, In one part of the city they expand into basins, and receive the name of lakes—the Sun lake and Moon lake. In the former is an island devoted to temples, and accessible by bridges. These bridges—good specimens of those aerial stone edifices which adorn this part of China—are required to sustain little more than their own weight, as the roads here are all mere footpaths, and no wheeled vehicles are found. One of the rivers is crossed by a bridge of boats 200 yds. long. The entire city is well paved; the streets are wider than those of most Chinese cities, and the display of shops is indicative of wealth and luxury. Nowhere, save at Hanchau, are such extensive and beautiful temples to be found. The most elegant and costly of these is dedicated to the queen of heaven; the goddess being the daughter of a Fuhkien fisherman, the people of that maritime province are her more special votaries. Elaborate stone sculpture, exquisitely fine wood carving, and a profusion of gilt and tinsel show that no expense has been spared to honor the popular goddess.

The center of the city is ornamented with an elegant seven-storied hexagonal tower—the heaven-bestowed pagoda, 160 ft. in height. A spiral flight of steps within the walls of the tower lead to the summit, from which the gazer beholds a splendid scene; innumerable villages dot the plain, which is reticulated by silvery water-courses, replete with evidence of successful commerce and agriculture. The population of the city is about 300,000; that of the plain, about 2,000,000. On many of the hills which environ these cities, green tea is successfully cultivated; while the mulberry, the tallow-tree, and numerous other stimulants of industry abound. Two crops of rice are procured annually from the fields; while the fisheries of the rivers and adjacent coast give employment to a numerous class of the population. Ice-houses close to the river give the banks a picturesque appearance; the ice is used for curing fish. Ningpo has an extensive coasting trade; but no considerable foreign trade has been developed, owing mainly to porterages on the inland water-communications, and to the proximity of Shanghai, where no such obstructions exist. The district city of Chinhai, at the mouth of the Ningpo river, is also a port. A walled town, containing about 30,000 inhabitants, 10 m. to the e. of Chinhai, is Kingtang, the nearest of the Chusan archipelago. Tinghai is the district city of the island of Chusan, which is 20 m. long, from 6 to 10 wide, and 51 in circumference. It is mountainous, with fertile valleys in a high state of cultivation. It has an excellent harbor. Tinghai was garrisoned several years by her majesty's forces from 1841, and was again temporarily occupied by the allied forces in 1860.—Dr. Macgowan's *Lectures.*

NINIAN, Saint, the apostle of the Picts, lived in the latter half of the 4th and the beginning of the 5th century. Whether Christianity had been introduced among the Picts before the time of Ninian has been a subject of controversy; but although the details of the legendary account are uncertain, it seems, beyond all question, that some Christians were to be found, at least among the southern Picts, in what is now known as the lowlands of Scotland, from the end of the 2d century. Nevertheless, either their number was originally very small, or the rising church had fallen away under adverse circumstances; and it is certain that when Ninian appeared among them, the Picts were in the main a pagan people. He was a Briton, and of noble birth; but had been educated at Rome, and there ordained a bishop. The exact time of his preaching in Scotland is unknown. His labors appear to have commenced in Cumbria, and to have extended over the greater part of the district as far n. as the Grampian hills, his see being fixed at Candida Casa, or Whithorn, in the modern Wigtonshire. His death is placed by the Bollandists in 432; his festival is Sept. 16.

NINIGRET, about 1610–77; a Narragansett chief who figured in the Pequot war of 1632, and as an ally of the colonists in 1637. A visit to the Dutch on the island of Manhattan caused him to be suspected by the Connecticut colony of plotting against the English colonists. The commissioners of the united colonies in 1653 declared war against him while he was making war on the Indians of Long Island. A summons was sent him from Hartford to appear there, which he failed to comply with; whereupon maj. Simon Willard was sent against him, and forced him to leave the country. In 1660–62 the colonists bought his lands,

NINON DE LENCLOS, a celebrated French woman, one of those characters that could have appeared only in the French society of the 17th c., was born of good family at Paris in 1615. Her mother tried to imbue her mind with a love of the principles of religion and morality, but her father, more successfully, with a taste for pleasure. Even as a child she was remarkable for her beauty and the exquisite grace of her person. She was carefully educated, spoke several foreign languages, excelled in music and dancing, and had a great fund of sharp and lively wit. At the age of ten she read Montaigne's *Essays.* Six years later, she commenced her long career of licentious gallantry by an amour with Gaspard de Coligny, then comte de Chatillon. To Coligny succeeded innumerable favorites, but never more than one at a time. Among Ninon de Lenclos's lovers we may mention the marquis de Villarceaux, the marquis de Sevigné, the marquis de Gersay, the great Condé, the duc de Larochefoucauld, marshal d'Albret, marshal d'Estrées, the abbe d'Effiat, Gourville, and La Châtre. She had two sons, but never

showed in regard to them the slightest instinct of maternity. The fate of one was horrible. Brought up in ignorance of his mother, he followed the rest of the world, and conceived a passion for her. When she informed him of the relation that subsisted between them, the unhappy youth was seized with horror, and blew out his brains in a frenzy of remorse. Even this calamity did not seriously affect Ninon de Lenclos; she was too well-bred to allow it to do that. Ninon de Lenclos was nearly as celebrated for her manners as for her beauty. The most respectable and virtuous women sent their children to her house to acquire taste, style, politeness. So great was her reputation, that when queen Christina of Sweden came to Paris, she said she wished particularly to visit the French academy and Ninon de Lenclos. We may gather some idea of her wit and sense from the fact that Larochefoucauld consulted her upon his maxims, Molière upon his comedies, and Scarron upon his romances. She died Oct. 17, 1706, at the age of 90, having preserved some remains of her beauty almost to the last.—See Guyon de Sardière's *Vie de Ninon de Lenclos;* Saint-Evremond's *Œuvres;* Douxmesnil's *Mémoires pour servir à l'Histoire de Mlle. de Lenclos.*

NINTH, in music, the next interval above the octave, being the same interval which an octave lower is termed the second. See INTERVAL.

NI'OBĒ, in Greek mythology, the daughter of Tantalus and (according to the most popular version of the story) the sister of Pelops. She was the wife of Amphion, king of Thebes, and bore him six sons and six daughters. Proud of her children, she despised Leto or Latona, who had only two children, Apollo and Diana, and prevented the people from the worship of these divinities; whereupon Latona, enraged, moved her children to destroy all the children of Niobé with their arrows. They lay nine days in their blood unburied, when Jupiter changed them into stone, and on the tenth day they were buried by the gods themselves. Niobé wandered about in distress, and at last was changed into stone on mount Sipylus, between Lydia and Phrygia, retaining, however, even as stone a sense of her woe. Such is the Homeric legend, which, however, was afterward much varied and enlarged. Niobé was a favorite subject of the ancient artists. A group representing Niobé and her children was discovered at Rome in 1583, and is now in Florence. Some of the sculptures are very beautiful. Even the ancient Romans were in doubts whether the work proceeded from Scopas or Praxiteles.

NIO'BIUM (symbol, Nb) is a rare metal discovered by H. Rose in the mineral *tantalite.* It is obtained by reducing the double fluoride of niobium and potassium with sodium; and forms a black powder insoluble in nitric acid, but readily soluble in a mixture of nitric and hydrofluoric acids. With oxygen it forms two compounds, niobous acid, NbO, and niobic acid, NbO_2; and chlorine, bromine, fluorine, and sulphur compounds corresponding to these acids have been prepared and examined. Neither the metal itself nor any of its compounds are of any practical importance.

NIOBIUM (*ante*) is now understood to be no separate metal, but the same with columbium. Pelopium, another supposed new metal, is merely the oxide of niobium or columbium.

NIOBRA'RA, a diocese of the American Protestant Episcopal church, including the greater part of Dakota, and bounded by the Missouri river, the line between Dakota and Nebraska, the 104th degree of w. long., and the 46th degree of n. lat. Yankton agency is the episcopal residence.

NIOBRA'RA RIVER, or L'EAU QUI COURT, rises in Laramie co., e. Wyoming territory, and flows in a generally e. course through n. Nebraska, entering the Missouri about 36 m. s.w. of Yankton, Dakota; length about 450 miles. The stream is shallow, not navigable, and very rapid in its course. In the upper part it flows through a very deep cañon, afterward passes through a sandy desert, but in the lower part winds through a fertile and well-watered region.

NIORT, a t. of France, capital of the department of Deux-Sèvres, on the Sèvre-Niortaise, is situated in an agreeable country, occupying the slope of two hills and the valley which intervenes, 110 m. n. of Bordeaux. Its principal edifices are the church of Notre-Dame, the town-hall, the theater, and the old castle. Besides these, the beautiful fountain du Vivier, the promenades, the library, and the college are worthy of notice. The dressing of chamois and the manufacture of gloves are the principal branches of industry. Dyeworks and tanneries are in operation. Pop. '76, 20,336.

Niort is an ancient town. In the 14th c. it was taken by the English, and held by them for 18 years.

NIPA, a genus of endogenous plants referred by some botanists to the order *pandanaceæ,* and by others to palms. *N. fruticans* is very common in the Eastern archipelago, and northwards as far as the Mergui river, but becomes rare further north. It flourishes with the mangrove in places inundated when the tide rises. It abounds in saccharine sap, from which a kind of *palm wine* is made, and also excellent sugar. The leaves are much employed for roofing houses, and large quantities are sent from the Tenesserim provinces northwards for this use.

NI'PADITES, a genus of fossil palm fruits found in the eocene clays of the island of Sheppey, in Kent. They are referred to *nipa* as their nearest living ally, and are con-

sidered to have resembled in habit that genus, and to have grown on the banks of an immense river which flowed from the tropical regions of a continent lying to the southward, and entered the sea at Sheppey, where it deposited the fruits and leaves borne down with the current, by the side of the starfishes and mollusca which inhabited the estuary. Some 13 different kinds have been described.

NIPIGON, or NEPIGON, LAKE, 35 m. n. of the most northerly part of lake Superior, in lat. 50° n., long. 88° w., about 70 m. long from n. to s., and 40 m. from e. to west. A coast sine, with bold headlands, and deep bays, gives a total length of shore of 580 miles. Its iurface is 813 ft. above lake Superior. A great number of mountain streams flow into it, and its waters flow out through the Nipigon river, 40 m. in length, southward, to Nipigon bay of lake Superior. The lake is very deep, studded with islands, and well stocked with fish.

NIP'ISSING, a co. in n. Ontario, Canada, having the Ottawa river for its e. boundary; having lake Nipissing (50 m. long and 35 m. wide), containing many islands, and numerous other lakes; its streams include French and Sturgeon rivers; 3,722 sq.m.; pop. '71, 1791. Its surface is hilly, the portion s. of the lake being 1100 ft. above the level of the sea.

NIP'ISSING, or NEPISSING, LAKE, in e. central Ontario, Canada, not far n. of the Ottawa river; length about 45 m.; greatest breadth, 28 miles. Its waters are mostly received from the n. by Sturgeon river, which connects it with a chain of smaller lakes. The only outlet is French river, by which the lake discharges into Georgian bay, an inlet of lake Huron. There are a number of small islands, and the vicinity is inhabited mostly by Indian tribes.

NIP'ISSINGS, an Indian tribe formerly living about the lake of the same name in the province of Ontario. They were known to Cartier and other French adventurers, and by them regarded as a peculiarly superstitious race. In the contests between the Hurons and Iroquois the latter drove the Nipissings n. and w. to the small lakes n. of lake Superior. They were accompanied by French priests who had already founded missions among them. After the conclusion of hostilities between the other tribes they returned eastward, and with other Algonquin tribes joined the Sulpician mission established near the lake of the Two Mountains. Their numbers have been greatly reduced.

NIPON', or NIPHON, the name improperly given by Europeans to the principal island of Japan, and borrowed from the Japanese name of the empire, which is *Dai Nihon* or Nippon. The chief island, or mainland, which is by far the largest part of the empire, had no separate name till lately, but is now officially called *Honshin* or *Hondo*. The inland sea of Suonada separates it from the islands of Kiusiu and Sikopf, and the strait of Sangar on the n.e. from the island of Yesso. On the n. it is bounded by the sea of Japan, and on the s. and e. by the Pacific ocean. The length of Nipon is 900 m., and its breadth 240; and it has an estimated area of 86,000 sq. miles. Yedo (q.v.) or To-Kei the capital of the empire, and the present residence of the mikado; Miako (q.v.) his former residence; and Osaka (q.v.) are the largest towns. The chief treaty ports are Hiogo—the outlet for the trade of Osaka—Yokohama (q.v.), and Kanagawa (q.v.). The ports of Yedo and Niegata, in the northern part of the island, on the sea of Japan, the official capital of the province in which it is situated, are situated near the great mineral region of Aidsu, but unfortunately possess a wretched harbor. Important meteorological observations, which give a good idea of the climate of the country generally, were made by Dr. Hepburn at Kanagawa, the shipping port of Yedo, in 1860. These are exhibited in a condensed form in the following table:

	Highest.	Lowest.	Rain in inches.	Snow in inches.	Number of earthquakes.
January	59° F.	18° F.			1
February	58	19	½	2	1
March	69	30	6½	1½	2
April	76	36	3¼		
May	80	44	16½		2
June	87	54	18¾		11
July	92	63	8¼		4
August	92	69	1 1/16		2
September	89	62	2¼		2

December	71	22	3⅓	1	1

Bracing sea-breezes make the heat of summer very endurable. The spring and autumn months are delightful. See HONDO.

NIRUKTA, or "Explanation," is the name of one of the six *Vedângas* (see VEDA) which explains difficult Vedic words. That there have been several works engaged in such a task, even at a very remote period of Hindu antiquity, and that they bore the name of Nirukta, is probable, for "Nirukta authors" are quoted either generally or by name in several Sanskrit authors; but the work which is emphatically called *Nirukta*, and which,

for the present, is the only surviving representative of this important Vedânga, is that of *Yâska*, who was a predecessor of Pân'ini (q.v.). His work consists of three parts—the *Naighan't'uka*, where, for the most part, synonymous words are taught; the *Naigama*, which contains words that usually occur in the Vedas only; and the *Daivata*, which contains words chiefly relating to deities and sacrificial acts. A commentary on this work has been composed by the same Yâska, and it likewise bears the name of Nirukta. In the latter, Vedic passages are quoted in illustration of the words to be explained, and the comment given by Yâska on these passages is the oldest instance, known at present to Sanskrit philology, of a Vedic gloss. Besides the great importance which Yâska's *Nirukta* thus possesses for a proper understanding of the Vedic texts, it is valuable also on account of several discussions which it raises on grammatical and other questions, and on account of the insight it affords us into the scientific and religious condition of its time.—Text and Commentary of *Yâska's Nirukta* have been edited by prof. R. Roth (Göttingen, 1852).

NIRVÂNA (from the Sanskrit *nir*, out, and *vâna*, blown; hence, literally, that which is blown out or extinguished) is, in Buddhistic doctrine, the term denoting the final deliverance of the soul from transmigration. It implies, consequently, the last aim of Buddhistic existence, since transmigration is tantamount to a relapse into the evils or miseries of *sansâra*, or the world. But as Hinduism, or the Brahmanical doctrine, professes to lead to the same end, the difference between *nirvâna* and *moksha*, *apavarga*, or the other terms of Brahmanism designating eternal bliss, and consequent liberation from metempsychosis, rests on the difference of the ideas which both doctrines connect with the condition of the soul after that liberation. *Brahman*, according to the Brahmanical doctrine, being the existing and everlasting cause of the universe, eternal happiness is, to the Brahmanical Hindu, the absorption of the human soul into that cause whence it emanated, never to depart from it again. According to this doctrine, therefore, the liberation of the human soul from transmigration is equivalent to that state of felicity which religion and philosophy attribute to *that* entity (see INDIA—*Religion*). As, however, the ultimate cause of the universe, according to Buddhism, is the void or non-entity, the deliverance from transmigration is, to the Buddhists, the return to non-entity, or the absolute extinction of the soul. However much, then, the pious phraseology of their *oldest* works may embellish the state of nirvâna, and apparently deceive the believer on its real character, it cannot alter this fundamental idea inherent in it. We are told, for instance, that nirvâna is quietude and identity, whereas sansâra is turmoil and variety; that nirvâna is freedom from all conditions of existence, whereas sansâra is birth, disease, decrepitude, and death, sin and pain, merit and demerit, virtue and vice; that nirvâna is the shore of salvation for those who are in danger of being drowned in the sea of sansâra; that it is the free port ready to receive those who have escaped the dungeon of existence, the medicine which cures all diseases, the water which quenches the thirst of all desires, etc.; but to the mind of the orthodox Buddhist, all these definitions convey but the one idea, that the blessings promised in the condition of nirvâna are tantamount to the absolute "extinction of the human soul," *after* it has obeyed, in this life, all the injunctions of Buddhism, and become convinced of all its tenets on the nature of the world and the final destination of the soul.

Although this is the orthordox view of nirvâna, according to the oldest Buddhistic doctrine, it is necessary to point out two categories of different views which have obscured the original idea of nirvâna, and even induced some modern writers to believe that the final beatitude of the oldest Buddhistic doctrine is not equivalent to the absolute annihilation of the soul.

The first category of these latter, or, as we may call them, heterodox views, is that which confounds with nirvâna the preparatory labor of the mind to arrive at that end, and therefore assumes that nirvâna is the extinction of thought, or the cessation to thought, of all difference between subject and object, virtue and vice, etc., or certain speculations on a creative cause, the conditions of the universe, and so on. All these views the Buddha himself rejects, as appears from the work *Lankâvatra* (q.v.), where relating his discourse on the real meaning of nirvâna, before the Bodhisattwa Mahâmati. The erroneousness of those views is obviously based on the fact, that the mind, even though in a state of unconsciousness, as when ceasing to think, or when speculating, is still within the pale of existence. Thus, to obviate the mistaken notion that such a state is the real nirvâna, Buddhistic works sometimes use the term *nirupadhisesha nirvâna*, or "the nirvâna *without* a remainder of substratum" (i.e., without a rest of existence), in contradistinction to the "nirvâna *with* a remainder;" meaning by the latter expression that condition of a saint which, in consequence of his bodily and mental austerities, immediately precedes his real nirvâna, but in which, nevertheless, he is still an occupant of the material world.

The second category of heterodox views on the nirvâna is that which, though acknowledging in principle the original notion of Buddhist salvation, represents, as it were, a compromise with the popular mind. It belongs to a later period of Buddhism, when this religion, in extending its conquests over Asia, had to encounter creeds which abhorred the idea of an absolute nihilism. This compromise coincides with the creation of a Buddhistic pantheon, and with the classification of Buddhist saints into three classes,

each of which has its own nirvâna; that of the two lower degrees consisting of a vast number of years, at the end of which, however, these saints are born again; while the absolute nirvâna is reserved for the highest class of saints. Hence Buddhistic salvation is then spoken of, either simply as *nirvâna*, or the lowest, or as *parinirvâna*, the middle, or as *mahâparinirvâna*, or the highest extinction of the soul; and as those who have not yet attained to the highest nirvâna must live in the heavens of the two inferior classes of saints until they reappear in this world, their condition of nirvâna is assimilated to that state of more or less material happiness which is also held out to the Brahmanical Hindu before he is completely absorbed into Brahman.

When, in its last stage, Buddhism is driven to the assumption of an Adi, or primitive, Buddha, as the creator of the universe, nirvâna, then meaning the absorption into him, ceases to have any real affinity with the original Buddhistic term. See BUDDHISM and LAMAISM.

NISARD, JEAN MARIE NAPOLEON DÉSIRÉ, b. France, 1806. In 1828 he became a contributor to the *Journal des Débats*, assuming a vigorous opposition to the government of Louis XVIII. After the revolution of 1830, for a short time he gave a warm support to the Louis Philippe government, then joined the opposition, and as one of the editors of the *National* was co-laborer with Armand Carrel in the most vigorous attacks upon the sinister divergence of Louis Philippe's administration from the path marked out for it by Lafayette. But soon changing, for the remainder of his life he was a champion of the past in politics, literature, and art; and cut to the quick, in his criticisms, the works of Hugo and other poets and dramatists of his own time. His works secured attention by their profuse and graceful diction, and an agreeable expression of imagination. Guizot, prime minister of Louis Phillippe, made him supervisor of normal schools in 1835, and promoted him to higher positions each year, until he loved the government better than his former opinions, and supported Louis Philippe as warmly as he had before satirized him. He sat as deputy in the chambers, 1842–48; and in his literary work, which was continued, plainly avowed that the French spirit was in its decadence, and looked back to the age of Louis XIV. for its brightest exemplars. Left in the shade by the revolution of 1848, he recovered place and power, political and literary, under the reign of Napoleon III. As lecturer in the college of France in 1855, he made such servile use of his opinions to defend the perjuries of the emperor that the students refused to listen, and gave him a *charavari*, which resulted in the imprisonment of 15 students, and the protection of subsequent lectures by a strong police force. Napoleon rewarded Nisard by naming him commander of the legion of honor in 1856, and director of the normal school in 1857. The latter position he retained till 1867, when he was raised to the dignity of a senator. He was elected a member of the Academy in 1850. Among his principal works are *Histoire de la litterature Française, Poëtes latins de la décadence*, and an early article in the *Débats* entitled *De la litterature facile, et de la littérature difficile.*

NISBET, CHARLES, D.D., 1736–1804; b. Scotland; graduated at Edinburgh university, 1754; was for some years a prominent Presbyterian clergyman at Montrose, and by his wit and power in argument won considerable influence in the general assembly. He openly avowed his smpathy with the American colonics, and having accepted the presidency of Dickinson college, Pennsylvania, came to America in 1785, where he delivered lectures on logic, philosophy of the mind, *belles-lettres*, and systematic theology, and endeavored to bring the system of education up to his high standard. He was a great scholar, and possessed a wonderful memory. He died at Carlisle, Penn., and his posthumous works were published two years after his death; his memoirs, by Dr. Miller, in 1840.

NISCE'MI, a t. of Sicily, in the province of Caltanisetta, 10 m. n.e. from Terranova, and on the right bank of the river Terranova. In 1790 this town was visited by an earthquake, and during seven shocks, the ground gradually sank in one place to the depth of 30 feet. Fissures opened, which sent forth sulphur, petroleum, hot water, and mud. Pop. 10,750.

NISCH, or NISSA, one of the principal towns of Servia, in the district added to the principality by the Berlin congress of 1878, 122 m. s.e. from Belgrade. It stands on the river Nissawa, a branch of the Morawa. The town is ill built; but many new houses and a well supplied bazaar attest its present prosperity. Nisch has long been noted as the point of meeting of many roads, of both military and commercial importance. Its importance would be greatly increased by the proposed construction of a railway from Belgrade to Constantinople and Thessalonica. In ancient times, Nisch bore the name of *Naissos*, and was a flourishing town of upper Mœsia; in it the emperor Constantine the great was born. It was Slavonic in the 6th c., was taken by the Tartar Bulgarians in the 8th, by the Servians again in the 12th, and by the Turks in 1389. Near Nisch, in 1689, the Markgraf Louis of Baden, with 17,000 men, destroyed a Turkish army of 40,000. Pop. 13,000.

NISHAPUR', or NÜSHAPUR, a t. of Persia, province of Khorassan, 53 m. w.s.w. of Meshid, is situated in a most beautiful and fertile valley. Pop. about 8,000. It is surrounded by a rampart and trench, and has a considerable trade in *turquoises*, which are obtained from mines in its vicinity.

NISI PRIUS is the name (borrowed from the first two words of the old writ which summoned juries) usually given in England to the sitting of juries in civil cases. Thus a judge sitting at *nisi prius*, means a judge presiding at a jury trial in a civil cause, and the *nisi prius* sittings are the jury sittings.

NISI PRIUS (*ante*), originally the clause in the writ which commanded the sheriff to bring a jury to Westminster, "unless before" (*nisi prius*) a justice of assizes should come to the county where the cause of action arose. In course of time the phrase was used to designate a large class of business transacted at the assizes before superior courts, and the phrases *nisi prius* judge, *nisi prius* law, and *nisi prius* courts, came into use. At present, in England and the United States, *nisi prius* courts are those courts, or terms of courts, held for the trial of civil causes, with the presence and aid of a jury; and a *nisi prius* sitting is to be distinguished from a sitting of the court *in banco*, in full bench, for the hearing of appellate cases.

NISIBIS, the capital of ancient Mygdonia, the north-eastern part of Mesopotamia. It was situated in a fertile district, and was of importance, both as a place of strength and as an emporium of the trade between the east and west. Nisibis was a city of very great antiquity, but of its remoter history nothing is known. In the time of the Macedonio-Syrian kings it was also called *Antiochea Mygdoniæ*. It was twice taken by the Romans (under Lucullus and Trajan), and again given up by them to the Armenians; but being a third time taken by Lucius Verus, 165 A.D., it remained the chief bulwark of the Roman empire against the Persians, till it was surrendered to them by Jovian after the death of Julian in 363. The name *Nisibin* is retained by a small village in the Turkish ejalet of Diarbekr, round which are numerous remains of the ancient city.

NITER, or **SALTPETER**, as it is frequently called, is the nitrate of potash (KO,NO_5). It usually occurs in long, colorless, striated, six-sided prisms; its taste is cooling, and very saline; it is soluble in seven times its weight of water at 60°, and in less than one-third of its weight of boiling water, but is insoluble in alcohol. When heated to about 660° it fuses without decomposition into a thin liquid, which, when cast in moulds, solidifies into a white, fibrous, translucent mass, known as *sal prunelle*. At a higher temperature, part of the oxygen is evolved, and nitrate of potash is formed. Owing to the facility with which niter parts with its oxygen, it is much employed as an oxidizing agent. Mixtures of niter and carbon, or of niter and sulphur, or of niter, carbon, and sulphur, deflagrate on the application of heat with great energy; and if niter be thrown on glowing coals, it produces a brisk scintillation. *Touch-paper* is formed by dipping paper in a solution of niter and drying it.

Niter occurs as a natural product in the East Indies, Egypt, Persia, where it is found sometimes as an efflorescence upon the soil, and sometimes disseminated through its upper stratum. The crude salt is obtained by lixiviating the soil, and allowing the solution to crystallize. A large quantity of niter is artificially formed in many countries of Europe, by imitating the conditions under which it is naturally produced. The most essential of these conditions seem to be the presence of decaying organic matter whose nitrogen is oxidized by the action of the atmosphere into nitric acid, which combines with the bases (potash and lime) contained in the soil. "The method employed in the artificial production of niter consists in placing animal matters, mingled with ashes and lime rubbish, in loosely aggregated heaps, exposed to the air, but sheltered from rain. The heaps are watered from time to time with urine or stable runnings; at suitable intervals the earth is lixiviated, and the salt crystallized. Three years usually elapse before the niter bed is washed; after this interval a cubic foot of the debris should yield between 4 and 5 ounces of niter. As there is always a considerable quantity of the nitrates of lime and magnesia present, which will not crystallize, carbonate of potash, in the shape of wood-ashes, is added so long as any precipitate occurs. The nitrate of lime is decomposed, and the insolubte carbonate of lime separated:

Carbonate of Potash. Nitrate of Lime. Carbonate of Lime. Nitrate of Potash.

$$KO,CO_2 + CaO,NO_5 = CaO,CO_2 + KO,NO_5$$

The clear liquor is then evaporated and crystallized. It has been found that the earth in which niter has once been formed furnishes fresh niter more readily than on the first occasion. Care is taken that the *niter plantations*, as they are termed, shall rest upon an impervious flooring of clay, so that the liquid which drains away from them may be collected and preserved."—Miller's *Elements of Chemistry*, 2d ed. vol. ii. p. 359.

Niter does not occur in any living members of the animal kingdom, but it is found in the juices of various plants, amongst which may be named the sunflower, nettle, goose-foot, borage, tobacco, barley, etc.

All the niter used in this country comes from the East Indies. The common varieties, which have a dirty yellowish appearance, are termed *rough* or *crude saltpeter*, while the purer kinds are called *East India refined*. The purification or refining of niter is effected by dissolving it in water, boiling the solution, removing the scum, straining it while hot, and setting it aside to crystallize. The most common impurities are sulphate of potash, chlorides of sodium and potassium, and nitrate of lime. Chloride of barium will detect the first of these impurities, nitrate of silver the second, and oxalate of ammonia the third.

Niter is employed in the manufacture of sulphuric acid, in the preparation of nitric acid, as an oxidizing agent in numerous chemical processes, as an ingredient of fireworks, and especially in the manufacture of gunpowder. It is extensively used in medicine. In moderate doses (from ten grains to a scruple) it acts as a refrigerent, diuretic, and diaphoretic, and hence its use is indicated when we wish to diminish abnormal heat, and to reduce the action of the pulse, as in febrile disorders and hemorrhages. In acute rheumatism it is given in large doses with great benefit. Some physicians prescribe as much as one, two, or three ounces, largely diluted with water, to be given in the course of 20 hours; but as in several cases a single ounce has proved fatal in a few hours, the effects of such large doses should be carefully watched. It is a popular remedy in sore throat, either in the form of niter balls, or powdered and mixed with white sugar. In either case the remedy should be retained in the mouth till it melts, and the saliva impregnated with it gently swallowed. The inhalation of the fumes produced by the ignition of *touch-paper* often gives speedy relief in cases of spasmodic asthma.

Nitrate of potash is sometimes called *prismatic niter* or *potash saltpeter*, to distinguish it from nitrate of soda, which is known in commerce as *cubic niter* or *soda saltpeter*.

Cubic niter, or *nitrate of soda* (NaO,NO_5), occurs abundantly on the surface of the soil in Chili and Peru. It derives its name from its crystallizing in cube-like rhombohedrons. In most of its properties it resembles ordinary niter, but in consequence of its greater deliquescence it cannot be substituted for that salt in the preparation of gunpowder. Being considerably cheaper than the potash-salt, cubic niter is often substituted for it in the manufacture of nitric and sulphuric acids; and it is used in agriculture as a top-dressing for wheat and oats. In several experiments it has been found that one cwt. per acre has produced an increase of 12 bushels in the wheat crop, and of 4 or 5 sacks in the oat crop.

NI'TI-GHAUT, a pass of the Himalaya, between the British district of Kumaon and Thibet. It takes its name from the village of Niti, in Kumaon, 13 m. s. of the pass, in lat. 30° 47′ n., and long. 79° 56′ east. The pass is 16,814 ft. above the level of the sea. This is regarded as the easiest pass between Kumaon and Thibet, and is consequently one of the principal channels of trade between Hindustan and Chinese Tartary. The Bhotias of Niti subsist chiefly by the carrying of goods in this trade. The articles of merchandise are conveyed on yaks, goats, and even sheep. Travelers often suffer much from difficulty of respiration on the pass of Niti-Ghaut, on account of the rarefaction of the air.

NI'TRATE OF POTASH. See NITER.

NITRATE OF SODA. See NITER.

NITRATES are salts formed by the union of nitric acid with bases. Some are found in a natural mineral condition, as saltpeter and cubic niter. They are distinguished for their solubility in water. On being heated, they undergo decomposition, being converted either into free nitric acid and a base, or into oxygen and a nitrite. For potassium nitrate and sodium nitrate, see NITER, *ante*. In many respects, one of the most important nitrates is the nitrate of silver, or lunar caustic (q.v.); see also SILVER, *ante*. It is of great use in surgery and the arts. As a caustic it acts powerfully, but rather superficially, producing a white slough, which blackens soon on exposure to the light. It is used in a solid state, or in solutions of all strengths. If dissolved in pure water, it remains colorless; but the smallest particle of organic matter will cause the solution to turn dark. On this account it is employed for making marking-fluids for linen. Indelible ink is usually made by dissolving 1 part of nitrate of silver and 4 parts of gum-arabic in 4 parts of water, and adding a little India ink to give it color, so that it may be seen when the mixture is applied. The place which is to receive the impression is first moistened with a solution of carbonate of soda and dried. After the application of the ink, the writing is exposed to the sunlight. Lunar caustic markings may be readily removed by applying a few drops of tincture of iodine, and dissolving out the iodide of silver thus formed by a solution of hyposulphite of soda, or a dilute solution of caustic potash. Nitrate of silver is used in photography (q.v.). Nitrate of ammonia, or ammonic nitrate (according to modern nomenclature, ammonium nitrate), NH_4O,NO_5, or, according to later views, NO_3NH_4, may be formed by the action of the galvanic current on a mixture of nitrogen and oxygen with an excess of hydrogen; but the common method is to add a slight excess of aqua ammonia to nitric acid. If crystallization is conducted slowly, six-sided prisms, like those of nitrate of potash, will be formed, having a specific gravity of 1.635. It melts at 226° F., and at 482° decomposes into water and nitrous oxide, or laughing-gas. See NITROGEN, *ante*. Nitrate of baryta, or baryta saltpeter, is made by treating the native carbonate of baryta with nitric acid. It crystallizes in anhydrous regular octahedrons, having a specific gravity of 3.184. When heated strongly it is converted into baryta, or baric oxide, with evolution of oxygen and nitrogen. Nitrate of bismuth and also sub-nitrate are important salts in the arts and medicine. See BISMUTH, *ante*. Nitrate of cobalt, prepared by the action of nitric acid on the oxide, crystallizes from solutions in beautiful pink-red deliquescent crystals, having a specific gravity of 1.83. It is much used in the chemical laboratory, particularly as a blow-pipe reagent. With magnesium compounds, it yields a pink color; with those of zinc, green; and with aluminum compounds a beautiful blue; for this reason it is

much used in coloring porcelain and earthenware. Nitrate of copper is made by the action of diluted nitric acid on copper turnings. Nitric oxide gas is given off during the operation. It crystallizes from cold solutions in beautiful blue, deliquescent, rhomboidal prisms, containing four molecules of water. From solutions above 59° it crystallizes with three molecules of water in needles, having a specific gravity of 2.047, soluble in alcohol. Nitrate of copper is converted, by moderate heat, into an insoluble basic nitrate. By raising the heat, the acid is completely driven off, leaving only the black oxide of the metal. Nitrate of copper is sometimes useful in surgery, as an application to certain ill-conditioned ulcers. The nitrates of iron are important salts. The protonitrate, or ferrous nitrate, is formed by digesting iron-turnings in very dilute nitric acid. It crystallizes in pale green rhombohedrons, having the formula $Fe(NO_3)_2,6H_2O$. It is much used in dyeing. The pernitrate, or ferric nitrate, is made by dissolving iron-turnings in nitric acid of sp. gr. between 1.2 and 1.3. It is used in surgery. Nitric acid forms several salts with lead, the principal of which is the common nitrate, or plumbi nitrate, $Pb(NO_3)_2$. It crystallizes in anhydrous regular octahedrons, usually milk-white and opaque. It dissolves in 7½ parts of cold water. It is decomposed by heat, with evolution of peroxide of nitrogen. Nitric acid forms a greater number of salts with mercury than with any other metal, one of which is used in medicine (see MERCURY, *ante*), and the other for the manufacture of corrosive sublimate.

NITRIC ACID is the most important of the five compounds which oxygen forms with nitrogen (q.v.). Until 1849 it was only known in the hydrated form (the *aquafortis* of the older chemists), but in that year Deville showed that *anhydrous nitric acid*, or *nitric anhydride* (NO_5), might be obtained in transparent colorless crystals by the action of perfectly dry chlorine gas on well-dried crystals of nitrate of silver, the reaction being exhibited in the equation:

Nitrate of silver.		Chlorine.		Chloride of silver.		Nitric anhydride.		Oxygen.
AgO,NO_5	+	Cl	=	AgCl	+	NO_5	+	O.

It is a very unstable compound, and sometimes explodes spontaneously. It dissolves in water with evolution of much heat, and forms hydrated nitric acid.

Hydrated nitric acid (symb. HO,NO_5, equiv. 63, sp. gr. 1.521), when perfectly pure, is a colorless, limpid, fuming, powerfully caustic fluid, possessing an intensely acid reaction, as shown by its action on litmus. It boils at 184°, and freezes at about −40°. It parts very readily with a portion of its oxygen to most of the metals, and hence is much used in the laboratory as an oxidizing agent. Its mode of action on the metals requires a few remarks. In order that a metal should unite with nitric, or any other acid, it is necessary that it should be in the form of an oxide. This oxidation is, however, effected at the same time that the metal and nitric acid are brought in contact, by one portion of the latter becoming decomposed and converting the metal into an oxide, while the remaining portion combines with the oxide thus formed, to produce a nitrate. The exact nature of the decomposition varies in the case of different metals.

Nitric acid, whether in the concentrated or in a more dilute form, acts energetically on organic matters. As examples of such actions, we may refer to its power of decolorizing indigo; of staining the skin and all albuminous tissues of a bright-yellow color; of coagulating fluid albumen; and of converting cotton fiber into an explosive substance. See GUN-COTTON.

The monohydrated acid (HO,NO_5) is by no means a stable compound. If it be exposed to the action of light it is decomposed into hyponitric acid (NO_4) (the peroxide of nitrogen of Graham) and oxygen; and mere distillation produces a similar effect. When it is mixed with water it emits a sensible amount of heat, owing to the formation of a much more stable hydrate, HO,NO_5, + 3Aq, which distils at 250° without change, and is unaffected by exposure to light. Its specific gravity is 1.424; and it is found that a weaker acid when heated parts with its water, and a stronger acid with its acid, till each arrives at this density. The existence of this hydrate has, however, been recently called in question by Roscoe.

The so-called *fuming nitric acid* is merely a mixture of the pure acid with hyponitric acid.

Nitric acid does not occur naturally in a free state; but it is found tolerably abundant in combination with potash, soda, lime, and magnesia; and after thunder-storms traces of it, in combination with ammonia, are found in rain-water. It may be formed in small quantity by passing a series of electric sparks through a mixture of its component gases in the presence of water, which is a mere imitation, on a small scale, of the mode in which it is produced in the atmosphere by a storm. It is usually prepared in the laboratory by the application of heat to a mixture of equal weights of powdered niter (nitrate of potash) and oil of vitriol (hydrated sulphuric acid) placed in a retort. A combination of sulphuric acid and potash remains in the retort, while the nitric acid distils over, and is condensed in the receiver, which is kept cool by the application of a wet cloth. The reaction is explained by the equation:

Niter.		Sulphuric acid.		Nitric acid.		Bisulphate of potash.
KO,NO_5	+	$2(HO,SO_3)$	=	HO,NO_5	+	$KO,HO,2SO_3$.

During distillation red fumes appear, arising from the decomposition of a portion of the nitric acid and a formation of some of the lower oxides of nitrogen. In this operation *two* equivalents of oil of vitriol are taken for *one* of niter, these being the proportions found by experience to be most suitable. If they are taken, equivalent for equivalent, a very impure red fuming acid is the result. In the manufacture of nitric acid on the large scale, the glass retort is replaced by a cast-iron cylinder coated with fire-clay, and the receiver by a series of earthen condensing vessels connected by tubes; and nitrate of soda, found native in Peru, is substituted for niter, in consequence of its being a cheaper salt, and of its containing 9 per cent more nitric acid.

Nitric acid combines with bases to form *nitrates*, some of which, as those of potash, soda, oxide of ammonium, silver, etc., are anhydrous, while others combine with a certain number (often six) equivalents of water of crystallization. Most of them are soluble in water, crystallizable, and readily fusible by heat; and at an elevated temperature they are all decomposed, usually leaving only the oxide of the metal. If paper be soaked in a solution of a nitrate, allowed to dry, and ignited, it burns in the smoldering mode characteristic of *touch-paper*. This property is, however, shared by a few other salts.

The tests for this acid when it is present in small quantities are less satisfactory than those for the other ordinary mineral acids. All its compounds are so soluble that no *precipitant* for this acid is known. The best method for its detection is mixing the fluid to be tested with a little concentrated sulphuric acid, and then pouring a strong solution of protosulphate of iron upon it, so as to form a separate layer. If much nitric acid be present, a black color is produced; if only a small quantity is present the liquid becomes reddish-brown or purple; the dark color being due to the formation of nitric oxide by the deoxidizing action of a portion of the iron salt on the nitric acid.

The applications of this acid in the arts, in manufactures, and in chemical processes are very extensive.

NITRIC ACID, The Medicinal Uses of. In the British pharmacopœia there is both a strong and a dilute acid. The strong acid has a specific gravity of 1.5, and is represented by the formula $3HO,2NO_5$, while the diluted acid is prepared by mixing two ounces of the former with thirteen of distilled water, and has a specifie gravity of 1.101.

The dilute acid is used internally as a tonic in conjunction with bitter infusions. In many cases of chronic inflammation of the liver, and in syphilitic cases in which the employment of mercurials is inadmissible, it may be prescribed with great benefit, either alone or in conjunction with hydrochloric acid, externally as a bath or lotion, or internally in doses of about 20 minims properly diluted. The strong acid is useful as an escharotic; as to destroy warts, some kinds of polypi, the unhealthy tissue in sloughing ulcers, etc., and as an application to parts bitten by rabid or venomous animals. Largely diluted, as 50 or 60 drops of the strong acid to a pint or more of water, it forms an excellent stimulative application to torpid ulcers.

NITRITES, salts produced by the action of nitrous acid on bases. The principal metallic nitrites are those of potassium, sodium, barium, ammonium, copper, lead, and nickel. The common mode of preparation is to reduce the nitrites by heat. The alcoholic nitrites or nitrous ethers are of more practical interest than the metallic salts. Nitrite of amyl is an inflammable liquid having the odor of pears; sp.gr. 0.877; boiling-point, 196° F. It is formed by the action of nitrous acid upon amylic alcohol. Its inhalation greatly increases the action of the heart, followed by loss of power. If has the power of suspending respiration and producing a condition of trance, which may stop short of death. In experiments upon animals, the appearances after death differ with the mode of administration. When given rapidly the lungs and brain are not congested; left side of heart empty, but right side filled with blood. When given slowly, both sides of the heart contain blood, and the lungs and brain are also congested. For nitrite of ethyl see Nitrous Ether, *ante.*

NI′TRO-BEN′ZOL, or Nitro-Benzide ($C_{12}H_5NO_4$), is a yellow oily fluid, of specific gravity 1.2, which may be distilled without decomposition, crystallizes in needles at 37°, and boils at 315°. It has a sweet taste, is insoluble in water, but dissolves freely in alcohol and ether. Its odor is very similar to that of oil of bitter almonds, which has led to its use in perfumery, under the name of *essence of nirbane.* It is obtained by treating benzol ($C_{12}H_6$) with warm fuming nitric acid, when 1 equivalent of the hydrogen is replaced by 1 of hyponitric acid, so that the benzol ($C_{12}H_5H$) becomes converted into nitro-benzol ($C_{12}H_5NO_4$).

NI′TRO-BEN′ZOL. [*From Supplement.*] This substance has recently taken a prominent place amongst the narcotic poisons. Under the name of *essence of nirbane,* it is largely employed as a substitute, in perfumery and confectionery, for oil of bitter almonds, which it closely resembles in smell, and to confectionery it gives the smell, but not the agreeable taste of that oil. It is a pale, lemon-colored liquid, with a pungent, disagreeable taste, and distinguishable by its odor from all other liquids except oil of bitter almonds, from which it differs in the following reaction: Pour a few drops of each on a plate, and add a drop of strong sulphuric acid. The oil of almonds acquires a rich crimson color with a yellow border, while the nitro-benzol produces no such color. In 1859 prof. Casper of Berlin published an account of this liquid under the name a "A New Poison," and described its effects on dogs and rabbits. In 1862 and since that date

various cases of human poisoning have been published, both in this country and abroad. We shall briefly notice three cases, in two of which the patient died after swallowing a portion of the fluid; while in the other the inhalation of the vapor proved fatal. A boy aged 17, while drawing off some nitro-benzol by a siphon, swallowed a portion of the liquid. There were no immediate symptoms; but he soon felt sleepy, and when at dinner ate but little, and said he felt as if he was drunk. This was between two and three hours after he had swallowed the liquid. He fell into a stupor, which became deeper and deeper, until death took place, without vomiting or convulsions, twelve hours after the ingestion of the poison. In the case of a man aged 43, who spilled a quantity of nitro-benzol over his clothes, and went about for several hours breathing the vapor, the effects were nearly the same. The progress of each of these cases, both of which are described by Dr. Letheby in the *Proceedings of the Royal Society* for 1863, was much the same as that of slow intoxication, excepting that the mind was perfecting clear until the coming on of the fatal stupor, which was sudden, as in a fit of apoplexy. From that moment there was no return of consciousness or bodily power; the sufferer lay as in a deep sleep, and died without a struggle. The duration of each case was nearly the same, about four hours intervening between the swallowing or inhaling of the poison and the beginning of stupor or coma, which lasted five hours. Nitro-benzol, as well as aniline, into which it seems to have been partly converted in the body, was detected in the brain and stomach. It is unnecessary to describe the steps to be taken for the detection of the poison in all these cases, no one but a professed toxicologist should be intrusted with an investigation on the result of which the life and character of a human being may depend. It is satisfactory to read Dr. Taylor's opinion, that "there is no probability that this liquid will be successfully employed for the purposes of murder without the certainty of detection."—*Principles and Practice of Medical Jurisprudence*, p. 311. It is worthy of notice that the vapor of this substance, as it is evolved from almond glycerine soap, has seriously affected females; and Dr. Taylor mentions the case of a gentleman who, from using a cake of the soap in taking a warm bath, fainted from the effects of the vapor, and was ill for some months afterwards. The mode of treatment that should be adopted in poisoning by this substance is essentially the same as that which should be adopted in poisoning by opium.

NITROGEN (symbol, N; equiv. 14; sp. gr. 0.9713) derives its name from the Greek words *nitron*, niter, and *gen-*, to produce, in consequence of its being an essential constituent of that salt. It is frequently termed *azote* (Gr. *a*, priv., *zoe*, life), especially by the French chemists, in consequence of its being a gas incapable of supporting life, and for the same reason the German chemists term it *stick-stoff* ("choking substance"). It was discovered by Rutherford in 1772. Long regarded as a "permanent" gas, it was liquefied by Cailletet in 1878.

Nitrogen is a colorless, tasteless, inodorous, permanent gas, which in its appearance in no way differs from the atmospheric air, of which it is the main ingredient. It is somewhat lighter than atmospheric air, 100 cubic in. at 60° F., and barometer 30 in., weighing 30.119 grains, while the same volume of air weighs 30.935 grains. It is characterized rather by negative than by positive properties. It is not combustible, nor is it a supporter of combustion (a lighted taper being immediately extinguished if immersed in this gas); it is not respirable, although it is not positively poisonous; for when it is mixed with respirable gases (as with oxygen in atmospheric air) it may be breathed without injury. It is very sligthly soluble in water, and hence may be collected over that fluid. Its combining powers are very slight, and although it unites with oxygen, hydrogen, chlorine, and many other substances, the union is never effected by the direct action of the elements on one another, but only by complicated processes, and many of the resulting compounds are of an exceedingly unstable nature.

Nitrogen is one of the most widely diffused elementary substances. It forms about four-fifths of the bulk of the atmosphere; for air, after having been freed from the small quantities of carbonic acid and aqueous vapor which it contains, consists, according to the experiments of Dumas and Boussingault, of 20.81 per cent of oxygen and 79.19 per cent of nitrogen by volume, or 23.01 of oxygen and 76.99 of nitrogen by weight; the two gases in this case being uniformly mixed, but not in chemical combination with one another. It occurs, however, in combination with oxygen in the form of nitric acid (HO,NO_5) in various nitrates, which are found as natural products in many parts of the globe. In combination with hydrogen it is abundantly found as ammonia, and combined with oxygen, hydrogen, and carbon, and sometimes additionally with sulphur and phosphorus, it forms the most important constituents of the solids and fluids of the animal body, and occurs in many vegetable products, especially in the alkaloids, such as morphia, strychnia, quinia, etc.

The ordinary methods of preparing and exhibiting this gas are based upon the removal of the oxygen from atmospheric air. This may be done: (1) By setting fire to a small piece of phosphorus placed in a capsule that floats on the water of the pneumatic trough, and by inverting a glass-receiver filled with air over it. The phosphorus combines with the oxygen of the air to form phosphoric acid, which dissolves in the water, while the nitrogen is left, and must be transferred to another vessel. (2) By placing a stick of phosphorus in a jar of air which is standing over water. In two or three days there will be the same results as in the former experiment—viz., phosphoric acid and nitrogen. (3) Or

by passing air through a tube containing heated copper filings, which absorb the oxygen. In the above cases a little carbonic acid is present, which may be removed by passing the gas through a solution of potash. Pure nitrogen may be directly obtained by the action of chlorine gas on a solution of the nitrogenous substance, ammonia.

Nitrogen forms with oxygen no less than 5 distinct compounds, containing, respectively, 1, 2, 3, 4, and 5 equivalents of oxygen, with 1 equivalent of nitrogen. These compounds are thus named and constituted: Protoxide of nitrogen (known also as nitrous oxide and laughing gas), NO; binoxide (or deutoxide) of nitrogen (known also as nitric oxide), NO_2; nitrous acid, NO_3; hyponitric acid (known also as peroxide of nitrogen), NO_4; nitric acid, NO_5.

Protoxide of nitrogen is a transparent, colorless gas, with a sweetish taste and smell. It is much more soluble in cold than in hot water, and therefore should be collected over the latter. Under a pressure of 50 atmospheres at 45° it is reduced to a colorless liquid, and it may be frozen into a transparent solid at about — 150°. This gas is about half as heavy again as atmospheric air, its specific gravity being 1.527. It supports the combustion of many bodies, such as carbon, sulphur, phosphorus, and iron, with a brilliancy similar to that which they exhibit in oxygen; and, like oxygen, when mixed with hydrogen, it forms a mixture which explodes on the application of a flame. The most remarkable property of the gas is its intoxicating power on the animal system. It may be respired for a short time if quite pure, or if only mixed with atmospheric air, without danger or serious inconvenience. The intoxication is frequently accompanied with an irresistible propensity to muscular exertion, and usually with uncontrollable bursts of laughter, and hence the gas has received the name of *laughing gas*. It is best obtained by heating solid nitrate of ammonia in a glass retort, when it is converted into protoxide of nitrogen and water. It has recently come into frequent use as an anæsthetic in dentistry and similar cases. It is less suited to protracted operations, as the effects are transient. It produces much less disturbance of the system than chloroform.

Binoxide of nitrogen is a colorless gas, very slightly soluble in water, and having a specific gravity of 1.039. Its taste and smell (if any) are unknown, since, in the presence of atmospheric air, it instantly becomes more highly oxidized, and forms yellowish-red fumes of hyponitric acid. As it is of little importance, it is unnecessary here to describe the mode of obtaining it.

Nitrous acid, or *nitrous anhydride*, is a substance of which, in its uncombined state, very little is yet known further than that it is a dark-blue, very volatile fluid, which boils at 32°, and is then converted into an orange-red gas.

Hyponitric acid presents a remarkable example of a body within comparatively small limits of temperature, occurring in a solid, a fluid, and a gaseous form. At a temperature of —4° it occurs in the form of colorless prismatic crystals, which are converted at about 9° into a fluid which, till the temperature reaches about 30°, is colorless; but at a higher temperature becomes yellow and orange, and at about 82° boils, and is converted into a brownish-red vapor. It is chiefly the vapor of hyponitric acid that forms the orange fumes that are produced when binoxide of nitrogen comes in contact with the air. It possesses a very disagreeable suffocating odor, and a caustic action, and colors the skin yellow, like nitric acid. It does not enter into combination with bases but is immediately decomposed by them into nitric and nitrous acids; and it is in consequence of its not possessing this essential character of an acid that Graham has given it the name of *peroxide of nitrogen*, a term that has since been adopted by Miller and other chemists.

Nitric acid is described in a special article.

Nitrogen combines with hydrogen in four proportions, but none of these compounds can be formed by the direct union of the component elements, and only one of them, viz., ammonia, has been obtained in the isolated form. They are—*imidogen* (NH), *amidogen* (NH_2), *ammonia* (NH_3), and *ammonium* (NH_4). Of these, the first two will be noticed under Organic Bases, while the last two are sufficiently described under Ammonia.

Nitrogen combines with chlorine, bromine, and iodine. The *chloride of nitrogen* is a heavy, oily, orange-colored fluid, insoluble in water, and evolving a vapor of a highly irritating nature. It is one of the most dangerous compounds known in chemistry, as it explodes with extreme violence when brought in contact with phosphorus, arsenic, potash, ammonia, caoutchouc, numerous oily matters, etc., at ordinary temperatures, and spontaneously when heated to above 200°. It has occasioned so many serious accidents that we shall omit all details regarding its mode of preparation. Its exact formula is unknown. *Bromide of nitrogen* is an oily-looking detonating liquid, resembling the chloride in appearance and properties. *Iodide of nitrogen* occurs as a black powder, which when dry explodes upon the slightest touch, and often without assignable cause.

Nitrogen enters into combination with various metals, as mercury, copper, titanium, molybdenum, and vanadium, forming a class of compounds to which the term *nitrides* is applied. Their most marked characteristic is that, like the preceding set of compounds, they are highly explosive, resolving themselves when struck, or at a high temperature, into their constituent elements.

NITRO-GLYCERINE [$C_6H_5N_3O_{18}$, or $C_6H_5(NO_4)_3O_6$], known also as *glonoin* or *glonoin oil*, is a compound which is produced by the action of a mixture of strong nitric and sul-

phuric acids on glycerine at low temperatures. Two methods of preparing it are given in Watts's *Dictionary of Chemistry*, vol. ii., pp. 890, 891, to which we must refer the reader who seeks for details on this subject. According to whatever method it is prepared, it is obtained as a light yellow oily liquid, of specific gravity varying from 1.525 to 1.6, inodorous, but having a sweet, pungent, aromatic taste; a single drop, however, if placed on the back of the tongue, produces headache and pain in the back, which last for many hours. It is only slightly soluble in water, but dissolves readily in ether, alcohol, and methylated spirits. This substance was discovered in 1847 by Sobrero, then a student in the laboratory of Pelouze in Paris, and afterwards professor in Turin. But though its discoverer ascertained its remarkable properties as an explosive, it remained simply an object of scientific interest till 1864, when it began to be manufactured on a large scale for blasting purposes by Nobel, a Swede resident in Hamburg. If ignited in the open air, nitro-glycerine burns rapidly and with a brisk flame, without any explosion; if poured out in a thin sheet, it ignites with difficulty, and burns incompletely. But it explodes at once if it is exposed to a moderately strong blow or concussion, to the concussion due to the explosion of gunpowder, to contact with red-hot iron, and especially to the action of detonating mixtures and fulminates; it likewise explodes on exposure to a high temperature (see below); the explosion, however it is produced, being in all cases excessively rapid, and unaccompanied by smoke. It is this explosive power that renders this compound a useful agent in blasting. According to Dr. Rudolf Wagner, the distinguished Bavarian technologist, it may be cooled down to 4° without becoming solid; but this statement probably refers to the chemically pure compound; for the nitro-glycerine of commerce, which was patented by the first maker, under the name of *Nobel's Patent Blasting Oil*, becomes solid if exposed for a considerable time to a temperature of 46°, crystallizing in long needles, which are most dangerous to handle, since they explode, even on being gently broken, with appalling violence. At 320°, nitro-glycerine begins (according to Dr. Adriani) to decompose, giving off red vapors; and if the heat be suddenly applied, or slightly raised above this point, the substance explodes with great violence; while, according to other observers, it is liable to explode at 240°, or a little higher; and if exposed for a length of time to half that temperature, explosion may take place at 180° or less. It is obvious from the formula for nitro-glycerine that it may be assumed to consist of glycerine, $C_6H_8O_6$, in which three atoms of hydrogen are replaced by three of peroxide of nitrogen, NO_4. The products of the complete combustion of 100 parts of pure nitro-glycerine are—water, 20 parts; carbonic acid, 58; oxygen, 3.5; and nitrogen, 18.5; and hence it has been calculated that one volume (say, a cubic inch) of this compound, at a specific gravity of 1.6, yields, on combustion or explosion:

Aqueous vapor,	554	volumes (say	cubic inches)
Carbonic acid,	469	"	"
Oxygen,	39	"	"
Nitrogen,	236	"	"
		"	"
	1298	"	"

According to Nobel, these gases expand, on explosion, to 8 times their bulk; in which case, one cubic measure (say, one cubic inch) of nitro-glycerine will yield 10,384 cubic measures (say, cubic inches) of gases; while one cubic measure of gunpowder will only yield 800 cubic measures of gases. Hence, it follows that, for equal bulks, nitro-glycerine is 13 times as strong as gunpowder, while for equal weights it is 8 times as strong.

The danger of using this compound in mining, etc., is greatly increased by its instability. Even when pure, it is liable, at a heat of 70° or less, to undergo slow, spontaneous decomposition into glycerine, oxalic and hydrocyanic acids, ammonia, etc., with a continuous escape of gaseous products, which, exerting pressure on the liquid, renders it so prone to explosion that even a slight concussion is attended with danger; and the impure commercial compound decomposes far more rapidly than the pure nitro-glycerine; indeed, impure nitro-glycerine may, from this cause, be regarded as "dangerously self-explosive even while standing quietly" (Adriani, *op. cit.*).

Many of our readers doubtless recollect the history of a terrific explosion that took place on board the ship *European*, when lying in harbor at Colon, Panama, on April 3, 1866. Amongst the cargo put on board at Liverpool were 70 cases of nitro-glycerine, and one case containing 70,000 percussion caps. At 7 A.M., on the 3d, a most tremendous explosion occurred in the after part of the ship. It was described as most rapid, without smoke, but with a great flame, and the ship was immediately after seen to be on fire. The whole of the deck and cabin aft were carried away, and the side of the ship was also much damaged, the plates above the water line being blown away, and the parts below it being much injured. For fear of further explosion, the ship was towed into the bay, where she shortly sunk. Nor was the injury confined to the *European*; the jetty was nearly blown away, and a vessel lying on the other side of it was much damaged. Houses in the town were also partially destroyed, the floors in many cases being torn up; and altogether about 50 lives were lost. When the bodies were recovered, they presented no sign of smoke nor any symptoms of scalding; and hence it was inferred that the explosion could not have been produced either by the percussion caps or by

steam. On these and other grounds, the conclusion was irresistible that the explosion was due to the nitro-glycerine. An action was (Aug. 1867) brought at Liverpool by the owners of the *European* against the shippers of the nitro-glycerine, on the ground that no due notice of the dangerous properties of that compound had been given; and at this trial, several of the important points regarding the explosive properties of nitro-glycerine, which we have noticed, were elicited from prof. Abel, chemist to the laboratory at Woolwich; col. Boxer, superintendent of the Woolwich laboratory; and prof. Roscoe, who appeared as scientific witnesses. To give some definite idea of the explosive force of this substance, prof. Roscoe stated that one case of it would have sufficed for the destruction of the *European*. It is used to a considerable extent in the slate quarries in Wales, and in mining operations. A workman at one of those quarries described how he had been set to clean a wagon which had held some of it, which he did by scraping it with a piece of slate; and inadvertently throwing the piece of slate into the wagon when he had finished, the percussion exploded the remnants of the oil, and the wagon was blown to pieces. He states that it is regarded as ten times as powerful an explosive agent as gunpowder.

We learn from a number of the *Nevada Gazette* (quoted in the *Chemical News*, Aug. 16, 1867), that this substance was very advantageously employed in the blasting necessary for the construction of the summit tunnel on the Central Pacific railway. The operation is said to have been carried on 25 per cent faster than if powder had been used. The small holes required for the oil can probably be drilled in less than one-third the time required for the larger ones necessary in using powder. The oil does much more execution than powder, as it always breaks the rock from 2 to 16 in. beyond the hole, and also throws out a much larger body. The oil was estimated as having, in hard rock, a strength five times greater than powder. It was made upon the spot, and was considered much stronger as well as safer than the imported compound. After having been used for several months, there had been no accident, nor had a single blast missed fire since the Chinamen commenced filling the cartridges. Col. Schaffner of the U. S. army published an official report on this compound, to which he gives the name of "nitroleum," which confirms the fact that its explosive properties are far greater than those of gunpowder. From a report on the same subject by capt. Grant, R.N., it appears that it is exploded by percussion, and apparently, under ordinary circumstances, by nothing else —neither by friction nor fire. Generally a trifling blow is sufficient to explode it. Its explosive force is about ten times that of gunpowder. It has all the appearance of common oil, and is usually carried in tin cases, each of which holds 25 lbs. Each can is packed in a wooden case for carriage. In a paper on this subject by M. Kopp, that chemist holds the view already noticed, that accidents are mainly due to the presence of impurities. He states that, by means of charges of 1500 or 2000 grams of oil, from 40 to 80 cubic meters of a hard rock may be detached.

We have already noticed Richter's observations on the slight inflammability of this compound; and as the employment of this explosive agent seems to be increasing, we shall give his other chief results, so as to bring up our knowledge to the latest possible date. The shaft in which the experiments were made was being sunk 30 ft. long by 8 ft. wide, in hard gray gneiss with occasional joints, which facilitated the working. From these experiments it appeared not only that its power was four or five times greater than that of the nitrate-of-soda gunpowder commonly used for mining purposes in Germany, but that other advantages accrued from its use, which may be summed up as follows: (1.) Fewer men are wanted for working out a certain-sized piece of ground, and fewer holes have to be bored than at present. (2.) Nitro-glycerine does not take fire easily (see above). (3.) The amount of smoke after a blast is small, as compared with that of powder; and workmen can return at once to the spot when the blast has taken place. (4.) Holes that have missed, or only partly torn, can be retamped and shot off, which, with the present arrangements, is impossible, or very dangerous. Against these advantages must be set off the following disadvantages: (1.) The gases formed during the explosion of nitro-glycerine have an injurious effect on the organs of sight and respiration. (2.) Nitro-glycerine explodes on being struck smartly, and easily freezes. (3.) The masses of rock which it removes are mostly very large, and considerable time has to be spent in breaking them up.

In another set of experiments, the relative cost of blasting by nitro-glycerine and gunpowder was compared, and it was found that a cubic fathom of ground could be removed by the former for £4 0s. 4d.; the cost amounted to £5 0s. 9¾d. when the latter was used. In sinking a shaft in clay-slate by means of nitro-glycerine, the cost was under £3 per cubic fathom. For further details regarding these experiments the reader is referred to the *Chemical News*, Nov. 15, 1867, which contains a translation of Richter's valuable memoir.

Dynamite, called by the miners of Colorado and Nevada the "giant powder," has of late years superseded the nitro-glycerine which is its principal component. Induced by the calamitous and inexplicable accidents that so often attended the use of nitro-glycerine, and which it seemed impossible to guard against, Nobel sought, by soaking various inert substances with nitro-glycerine, to obtain some composition which should have the valuable powers of the explosive oil without its deadly risks. In 1867 he gave the name of dynamite to the successful outcome of his experiments. Dynamite, as generally

manufactured, consists of infusorial earth, porcelain earth, coal-dust, siliceous ashes or the like, saturated with about three times its weight of nitro-glycerine—though the proportion varies with different makers. According to its elements, it is to the eye a grayish-brown, reddish, or blackish powder, damp and greasy to the touch, and without smell. In the open air it burns quietly, and gives off fumes of carbonic acid and nitrogen with a watery vapor. If properly made, it ought not to be exploded by heat up to 212°, by a spark, or by any ordinary shock; though cases are said to have occurred where one of these causes singly has sufficed. In order to take advantage of its enormous blasting power, it is pretty tightly packed in paper or parchment cartridges, and exploded by means of a fulminating fuse or cap. It leaves a white ash, with little or no smoke. In the hands of careful workmen who know what they are about, its use is comparatively free of danger, and it may be easily transported. It is now regarded as one of the safest of explosives, though its manufacture is still attended with great risks. Over gunpowder it has the advantage that it is not injured by damp; it also saves labor, fewer and smaller holes sufficing in blasting operations. It costs about four times as much as gunpowder, but performs eight or ten times as much work. The violence and rapidity of its explosion renders dynamite unfit for use in fire-arms. It is reckoned that in 1875 at least 100,000 cwts. of dynamite were manufactured in Europe.

Various other nitro-glycerine powders or compounds have been patented. *Dualline* is said to consist of wood gunpowder soaked with the oil; or of nitro-glycerine, fine sawdust, and a little niter. The improved *lithofracteur* contains 52 parts of nitro-glycerine, 30 of silex, 12 of coal-dust, and 2 of sulphur. Colonia powder, fulminatine, lignose, sebastine, heracline, are all names for compositions in which nitro-glycerine is the chief ingredient, and are all more or less valuable as explosives. See EXPLOSIVES.

NITRO-MURIATIC ACID, is a mixture of nitric and hydrochloric acids. On account of having the power of dissolving gold, the king of metals, it was called *aqua-regia.* Hydrochloric acid does not possess the power of dissolving gold, or in other words the metal has not sufficient power to take the chlorine from the hydrogen. In the presence of nitric acid, however, the oxygen of which appears to have a decomposing influence upon the hydrochloric acid, the gold steps in, so to speak, and bears off the chlorine. Platinum also requires the action of *aqua-regia* to enable it to combine with chlorine. Chlorine in a nascent state (just liberated from combination) has more power to combine with gold or platinum than after it has been collected; its power is also increased by the polarized condition of the molecules of all the elements present. It is not only useful in chemistry, but has been employed in medicine with great benefit in certain cases of disease of the liver, administered internally, and also as a bath, diluted with large quantities of water.

NITROUS ACID. See NITROGEN, *ante.*

NI'TROUS ETHER, or NITRITE OF OXIDE OF ETHYL, is represented by the formula C_4H_5O,NO_3, or AeO,NO_3, Ae being the symbol for ethyl (C_4H_5). It is a pale yellow fluid, having a specific gravity of 0.947, and evolving an agreeable odor of apples. On evaporation, it produces a great degree of cold, it boils at 62°, and it is very inflammable. It does not mix with water, but is readily miscible with alcohol. When kept in contact with water it soon decomposes, and an acid mixture of a very complicated character is formed. It may be obtained by mixing 1 part of starch and 10 of nitric acid in a capacious retort, which must be gently heated. The vapor of nitrous acid which is evolved by the action of the starch on the nitric acid, is conducted into alcohol, mixed with half its weight of water, contained in a two-necked bottle, which is to be plunged into cold water. The second neck of this bottle is connected with a good cooling apparatus; and the vapor combining in its passage through the alcohol with the oxide of ethyl, forms nitrous ether, which distils in a continuous stream. This, which is known as Liebig's method, is the best process, but it is usually prepared by the direct action of nitric acid on alcohol, in which case the nitric acid is deoxidized by the hydrogen and carbon of the ethyl of part of the alcohol.

The *spirit of nitrous ether*, or *sweet spirit of niter*, used in medicine, is a mixture of nitrous ether with about four times its volume of rectified spirit. Its specific gravity should not exceed 0.85. It is used, in conjunction with other medicines, as a diuretic, especially in the dropsy which follows scarlatina; and it is employed, in combination with acetate of ammonia and tartarized antimony, in febrile affections. The dose in febrile cases is from half a dram to a couple of drams, and if we wish it to act as a diuretic, two or three drams should be given. It is a rather expensive medicine, and consequently is extremely liable to adulteration. In the new British pharmacopœia it is recommended that this substance should be directly obtained by the distillation of nitrite of soda (five ounces), sulphuric acid (four fluid ounces), and rectified spirit (two pints)—a process open to many practical objections.

NITROUS OXIDE, or LAUGHING GAS. See NITROGEN (protoxide) *ante.*

NITZSCH, KARL IMMANUEL, one of the most distinguished theologians that modern Germany has produced, was b. Sept. 21, 1787, at Borna. He studied for the church at Wittenberg, where he took his degree in 1810, and where, in 1813, he became parish minister. Here his religious opinions underwent a great modification, through the influ-

ence of Schleiermacher and Daub, and he awoke to a clearer perception of the essence of religion. From this time forward Nitzsch is to be regarded as one of that new school—of which Neander is the greatest representative—who endeavored to reconcile faith and science, not by forced and unnatural methods, but by pointing out their distinctive spheres, and by exhibiting in their own spiritual life that union of reason and reverence for which they argued in their writings. In 1822 Nitzsch was called to Bonn as ordinary professor of theology and university preacher, where he labored with great diligence for more than twenty years, not only in theology, but in all matters affecting the welfare of the Prussian church. In 1847 he succeeded Marheineke at Berlin, and as professor, university preacher, and upper consistorial councilor, he exercised with prudence and moderation a wide ecclesiastical influence. In his political (perhaps also in his religious) views he may be classed with the late chevalier Bunsen. The high Lutheran party having denounced liberal politics as irreligious, Nitzsch and Bunsen and others have vindicated them on the ground of Christianity, not without success. In theology his position will be best understood when we say that he subordinated dogma to ethics, or rather that he believed the only dogmas which can hope to permanently maintain themselves are those that result from an ethical apprehension of Christianity. Besides numerous smaller treatises on dogmatics, the history of dogmas and liturgies, three larger works call for special mention. These are his *System der Christlichen Lehre* (Bonn, 1829; 6th edit. 1851); his *Praktische Theologie* (Bonn, 1847–48); and his *Predigten*, or sermons, of which several collections have appeared, and which are remarkable for their extraordinary richness of thought. He died in 1868. NITZSCH, GREGOR WILHELM (born in 1790), brother of the preceding, acquired a high reputation as a philologist, and was professor of archæology at Leipsic till his death in 1861. He was considered one of the ablest opponents of Wolf's Homeric theories. His chief work is *Die Sagenpoesie der Griechen* (Brunswick, 1852).

NIVELLES (Flem. *Nyvel*), a t. of Belgium, in the province of Brabant, 18 m. s. of Brussels. It has a fine church, called the church of St. Gertrude (built in the Romanesque style of architecture, 1048 A.D.), which claims to contain the relics of St. Gertrude, daughter of Pepin, Maire du Palais. They are deposited in a shrine placed over the high altar. Niveiles has manufactures of linen, cotton, lace, etc. Pop. in 1880 about 10,000.

NIVERNAIS, formerly a province in the middle of France, nearly corresponding to the present department of Nièvre. It was divided into eight territorial districts, and its towns enjoyed municipal privileges at a very early period. The principal landowners were the counts, afterwards dukes, of Nevers, who held under their vassalage more than 1800 fiefs.

NIX, in the masculine, and *nixe* in the feminine (Old High Ger. *nihhus;* Anglo-Saxon, *nicor;* Dutch, *nikker;* Old Norse, *nikr;* Swed. *näk, nek;* Dan. *nök, nok*—whence our name for the devil, *Nick*, not as some absurdly suppose, from *Nicholas* Machiavelli), the common name for all water spirits in the Teutonic mythology. They are represented as of human form, or sometimes as passing into that of a fish or of a horse. They love music and dances, and possess the gift of prophecy, like the Greek muses, sirens, and other water-gods. The nix taught, in return for a good gift, the art of playing on a stringed instrument; and often in the evening sunshine the nixes, combing their long hair, were wont to mingle in the dances of mortals; but their company was dangerous, for though sometimes wearing a mild appearance, they were more frequently cruel and malignant. The *water-kelpie* of Scotland must be reckoned a member of the genus nix, but in him the evil element alone exists. He generally, if not always, assumed the form of a water-horse; frequented fords and ferries, especially during storms; allured travelers to mount him, and then dashed furiously with them into the stream which he had flooded by his devilish power, and submerged them in the roaring currents.

NIZAM'S DOMINIONS, an extensive territory in the interior of Southern India, lying to the n.w. of the presidency of Madras, in lat. 15° 10′ to 21° 42′ n., and long. 74° 40′ to 81° 32′ east. Length from s.w. to n.e, 480 m.; extreme breadth, 340 miles. Area, 90,000 sq.m., and population estimated at 9,000,000. The surface is a slightly-elevated table-land. The principal rivers are the Godavari (Godavery), with its tributaries the Dudhna. Manjera, and Pranhita; and the Kistna (Krishna), with its tributaries the Bimah and Tungabhadro. The soil is naturally very fertile, but poorly cultivated; yet, wherever it receives moderate attention, it yields harvests all the year round. The products are rice, wheat, maize, mustard, castor-oil, sugar-cane, cotton, indigo, fruits (including grapes and melons), and all kinds of kitchen vegetables. The pasturages are extensive, and sheep and horned cattle are numerous. Marsh and jungle, however, occupy a great space, and originate fevers, agues, diseases of the spleen, etc., though the climate is quite healthy where these do not abound. The mean temperature of the capital, Hyderabad, in January is 74° 30′, and in May 93°. The inhabitants manufacture for home use woolen and cotton fabrics, and export silk, dressed hides, dye-stuffs, gums, and resins. Good military roads traverse the territory. The revenue of the nizam is reckoned at £1,550,000 yearly. The ruler is a Mohammedan, but his subjects are mostly Hindus.

In 1687 the territory, now known as the Nizam's Dominions, became a province of the Mogul empire; but in 1719 the governor or viceroy of the Deccan, Azof Jah, made

himself independent, and took the title of *nizam-ul-mulk* (regulator of the state). After his death, in 1748, two claimants appeared for the throne, his son Nazir Jung, and his grandson Mirzapha Jung. The cause of the former was espoused by the East India company, and that of the latter by a body of French adventurers under gen. Dupleix. Then followed a period of strife and anarchy. In 1761 nizam Ali obtained the supreme power, and after some vacillation signed a treaty of alliance with the English in 1768. He aided them in the war with Tippoo, sultan of Mysore, and at the termination of that war, in 1799, a new treaty was formed, by which, in return for certain territorial concessions, the East India company bound itself to maintain a subsidiary force of 8,000 men for the defense of the nizam's dominions. The nizam remained faithful to the British during the mutiny of 1857–58. The territory is frequently called Hyderabad or Haidarabad. A British resident advises the nizam.

NIZH'NI-NOVGOROD'. See NIJNI-NOVGOROD, *ante*.

NIZH'NI-TAGILSK'. See NIJNI-TAGILSK, *ante*.

NOAH, 3115–2065 B.C., a son of Lamech, remarkable in character, deeds, and history. He was just in his dealings with men, pious in his relations to God, and preserved his uprightness in the midst of abounding and defiant wickedness. The great things in his life are recorded only in outline, and as such are familiar to all readers of the Bible. 1. He was a preacher of righteousness. 2. He built the ark (see ARK). 3. He and his family were brought safely through the flood, in which all the rest of mankind were drowned. 4. After the flood he commenced anew the work of cultivating the ground and planted a vineyard, the wine from which led to the one sin recorded against him, producing dishonor to himself and occasioning transgression and punishment among his descendants.

NOAH, MORDECAI MANUEL, 1785–1851; b. Philadelphia; studied law, removed to Charleston, S. C., was appointed consul at Riga 1811, and at Morocco 1813. Returning to the United States in 1816, he edited the *National Advocate*, a New York democratic paper, till 1826, when he founded the *New York Enquirer*, afterwards merged in the *Courier and Enquirer*. He established the *Evening Star* in 1834, but soon withdrew from connection with the daily press, and became one of the founders of the weekly *Sunday Times*. He held at various times the offices of sheriff of New York co., surveyor of the port of New York, and judge of the court of sessions. He was a Jew, adhered to the Jewish religion, and attempted to found a Jewish colony on Grand island in the Niagara river. He wrote a number of dramas and other works.

NOAILLES, LOUIS MARIE, Vicomte de, 1756–1804; of an illustrious French family, b. in Paris, and associated with Lafayette (their wives were sisters) in the aid given to the American colonies in their struggle for independence. In 1789, at the opening of the French states-general, he was a deputy among the nobles representing Nemours, and on Aug. 4 made the memorable proposition for the abolition of titles and feudal privileges of all kinds, the interdiction of liveries, and the abolition of slavery in the dominions of France. During the excesses of the Jacobins he came to the United States, but returned to France as soon as the persecution of the old nobility ceased, and a few years later was made brig.gen. in San Domingo, where he died from wounds received in the capture of an English sloop of war near Havana by one of the most remarkable feats of naval *ruse* and daring on record.

NO'BILE OFFIC'IUM, the term used in the law of Scotland to denote the high prerogative right of the court of session to exercise jurisdiction in certain cases—as, for example, to appoint a judicial factor to young children or to lunatics.

NOBILITY, that distinction of rank in civil society which raises a man above the condition of the mass of the people. Society has a tendency to inequality of condition, arising from the natural inequality, physical, moral, and intellectual, of those who compose it, aided by the diversity of external advantages, and of the principles and habits imbibed at an early age. This inequality is apt to increase; the son, inheriting the faculties of his father, is more favorably situated than his father was for making use of them; and hence, in almost every nation, in even the very early stages of civilization, we find something like a hereditary nobility. Privileges originally acquired by wealth or political power are secured to the family of the possessor of them; and the privileged class come to constitute an order, admission into which requires the consent of society or of the order itself.

The ancient Romans were divided into *nobiles* and *ignobiles*, a distinction at first corresponding to that of patricians and plebeians. A new nobility afterwards sprung out of the plebeian order, and obtained (336 B.C.) the right to rise to high offices in the state; and in course of time the descendants of those who had filled curule magistracies inherited the *jus imaginum*, or right of having images of their ancestors—a privilege which, like the coat-of-arms in later ages, was considered the criterion of nobility. The man entitled to have his own image was a *novus homo*, while the *ignobilis* could neither have his ancestor's image nor his own.

The origin of the feudal aristocracy of Europe is in part connected with the accidents which influenced the division of conquered lands among the leaders and warriors of the nations that overthrew the Roman empire. Those who had acquired a large share of

territorial possession, and their posterity to whom it was transmitted, were naturally looked on as the fittest persons to occupy the great offices of state and wield political power. The Frankish kingdom in Gaul was divided into governments, each under the authority of a chieftain called a count or *comes*—a designation derived from the *comes* of the Roman empire—whose Teutonic equivalent was *graf*. A higher dignity and more extensive jurisdiction was conferred on the *dux* or duke, a term also of Roman origin, and implying the duty of leading the armies of the country. In the Lombard kingdom of Italy, the same term was applied to the great officers who were intrusted with the military and civil administration of cities and their surrounding provinces. The marquises were guardians of the frontier marches. In the subinfeudations of the greater nobility originated a secondary sort of nobility, under the name of vavasours, castellans, and lesser barons; and a third order below them comprised vassals, whose tenure, by the military obligation known in England as knight's service, admitted them within the ranks of the aristocracy. In France the allegiance of the lesser nobles to their intermediary lord long continued a reality; in England, on the other hand, William the conqueror obliged not only his barons who held in fief of the crown, but their vassals also, to take an oath of fealty to himself; and his successors altogether abolished subinfeudation.

The military tenant who held but a portion of a knight's fee participated in all the privileges of nobility, and an impassable barrier existed between his order and the common people. Over continental Europe in general, the nobles, greater and lesser, were in use, after the 10th c., to assume a territorial name from their castles or the principal town or village on their demesne; hence the prefex "de," or its German equivalent "von," still considered over a great part of the continent as the criterion of nobility or gentility. Britain was, to a great extent, an exception to this rule, many of the most distinguished family names of the aristocracy not having a territorial origin. See NAME.

Under the feeble successors of Charlemagne, the dukes, marquises, and counts of the empire encroached more and more on the royal authority; and in course of time many of them openly asserted an independence and sovereignty with little more than a nominal reservation of superiority to the king. By the end of the 9th c. the Carlovingian empire had been parceled into separate and independent principalities, under the dominion of powerful nobles, against whom, in Germany, the crown never recovered its power. In France, however, the royal authority gradually revived under the Capetian race, the great fiefs of the higher nobility being one by one absorbed by the crown. In England, where the subjection of the feudal aristocracy to the crown always was, and continued to be a reality, the resistance of the nobles to the royal encroachments was the means of rearing the great fabric of constitutional liberty. All those who, after the conquest, held *in capite* from William belonged to the nobility. Such of them as held by barony (the highest form of tenure) are enumerated in *Domesday*. Their dignity was territorial, not personal, having no existence apart from baronial possession. The *comes* was a baron of superior dignity and greater estates; and these were in England the only names of dignity till the time of Henry III. The rest of the landholders, who held by other tenures than barony, also belonged to the nobility or gentry.

After the introduction of heraldry, and its reduction to a system, the possession of a coat of arms was a recognized distinction between the noble and the plebeian. In the words of sir James Lawrence (*Nobility of the British Gentry*): "Any individual who distinguishes himself may be said to ennoble himself. A prince judging an individual worthy of notice gave him patent letters of nobility. In these letters were blazoned the arms that were to distinguish his shield. By this shield he was to be known or *nobilis*. A plebeian had no blazonry on his shield, because he was *ignobilis*, or unworthy of notice. Hence arms are the criterion of nobility. Every nobleman must have a shield of arms. Whoever has a shield of arms is a nobleman. In every country of Europe, without exception, a grant of arms, or letters of nobility, is conferred on all the descendants." On the continent the term noble is still generally used in this sense; in England it is now more common to restrict the words noble and nobility to the five ranks of the peerage constituting the greater nobility, and to the head of the family, to whom alone the title belongs. Gentility, in its more strict sense, corresponds to the nobility of sir J. Lawrence and of continental countries. This difference of usage is a frequent source of misapprehension on both sides of the channel; at some of the minor German courts the untitled member of an English family of ancient and distinguished blood and lineage has sometimes been postponed to a recently-created baron or "herr von," who has received that title, and the gentility accompanying it, along with his commission in the army. It has been taken for granted that the latter belongs to the "adel" or nobility, and not the former.

The original higher nobility of Germany consisted of the dynasty nobles, i.e., the electoral and princely houses of the realm, with those counts and barons who had a seat in the diet or estates of the realm. These last have, since 1815, all been elevated to higher titles; most of the counts, in recompense for their acquiescence in the abolition of the German empire, receiving the diploma of prince, a title to which our dukes, marquises, and earls have also an undoubted right. The lower German nobility, corresponding to our gentry, were the merely titular counts and barons (i.e., those who had no seat in the diet), the edel-herren and banner-herren (something like our bannerets) the knights of the holy Roman empire, the "edlen von" (who now take the style of

baron), and the common nobles distinguished only by the prefix "von." Throughout the middle ages the lesser nobility of Britain preserved a position above that of most continental countries, being, unlike the corresponding class in Germany, allowed to intermarry with the high nobility, and even with the blood-royal of their country.

The higher nobility, or nobility in the exclusive sense of England, consist of the five temporal ranks of the peerage—duke, marquis, earl, viscount, and baron) in the restricted signification of the word), who are members of the upper house of parliament. Formerly all the barons or tenants-in-chief of the sovereign were bound to attend his councils; but after the reign of Edward I. only a select number of them were summoned, the rest appeared by representatives—the former were considered the greater, the latter the lesser barons.. See MINOR BARONS. In Scotland the whole barons continued to sit in parliament till a much later period; and after the minor barons attended only by representatives from their body, these representatives sat in the same house with the greater nobility, and, up to the union, their votes were recorded as those of the "small barrounis." By the act of union between England and Scotland the Scotch peers elect 16 of their number to represent their body in the house of lords in each parliament. The peers of Ireland, in virtue of the Irish act of union, elect 28 of their number to sit in the house of lords for life. The act of union with Scotland has been understood to debar the sovereign from creating any new Scotch peerages; all peers created in either England or Scotland between that date and the union with Ireland are peers of Great Britain; and peers created in any of the three kingdoms subsequently to the union with Ireland are peers of the United Kingdom, with this exception that one new peerage of Ireland may be created on the extinction of three existing peerages. When the Irish peers are reduced to 100, then, on the extinction of one peerage another may be created. All peers of Great Britain or of the United Kingdom have a seat in the house of lords. A Scotch peer, though not one of the 16 representative peers, is debarred from sitting in the house of commons, a disability which does not attach to Irish peers. The peerage is, from time to time, recruited by new additions, the persons selected being in general peers of Scotland or Ireland; younger members of the families of peers; persons distinguished for naval, military, political, or diplomatic services; eminent lawyers promoted to high judicial appointments; persons of large property and ancient family, noble in the more extended sense; and occasionally, but rarely, persons who have by commerce acquired large fortunes and social importance. At present the peerage comprehends about 555 individuals—the number of peerage titles being much greater, as several titles often merge in one person. Five royal dukes are included in this enumeration, as also 87 peers of Scotland and 183 of Ireland. Only 25 of the present Scotch and 89 Irish peers are without seats in the house of lords, in consequence of there being, besides the representative peers, 40 peers of Scotland and 80 of Ireland who are at the same time peers either of England, Great Britain, or of the United Kingdom. The privileges belonging to peers as members of parliament will be explained under PARLIAMENT; as peers, they also possess the following immunities: They can only be tried by their peers for felony, treason, or misprision of treason when the whole members of the peerage are summoned, and the accused is acquitted or condemned by the voice of the majority, given not on oath, but "on honor." This privilege, which extends to peeresses, either in their own right or by marriage, is in Scotland further regulated by act 6 Geo. IV. c. 66. A peer answers to bills in chancery upon his honor, and not on oath; but when examined as a witness in civil or criminal cases, or in parliament, he must be sworn. He cannot be bound over to keep the peace elsewhere than in the court of queen's bench or of chancery. Scandal against a peer is "*scandalum magnatum*," a more heinous offense than slander against another person, and subjects the offender, by various English acts, to statutory punishments. All the privileges belonging to the English peers, except the right of sitting in the house of lords, were extended to the peers of Scotland by the treaty of union. A peer who has different titles in the peerage takes in ordinary parlance his highest title, one of the inferior titles being given by courtesy to his eldest son. Certain courtesy titles (q.v.) belong also to the daughters and younger sons of a peer, but do not extend to their children.

In France a limited body of the higher nobility, styled the peers, were in the enjoyment of privileges not possessed by the rest. The title of duke was subject to strict rule, but many titles of marquis and count, believed to be pure assumptions, were recognized by the courtesy of society. The head of a noble family often assumed at his own hand the title of marquis; and if an estate was purchased which had belonged to a titled family, the purchaser was in the habit of transferring to himself the honors possessed by his predecessor—a practice to which Louis XV. put a stop. Immediately before the revolution 80,000 families claimed nobility, many of them of obscure station, and less than 3,000 of ancient lineage. Nobles and clergy together possessed two-thirds of the land. Practically the estimation in which a member of the French nobility was held depended not so much on the degree of his title as on its antiquity, and the distinction of those who had borne it. The higher titles of nobility were not borne by all members of a family; each son assumed a title from one of the family estates—a custom productive of no small confusion. Unlike "roturier" lands, which divided among all the children equally, noble fiefs went to the eldest son. The revolution overthrew all distinction of ranks. On June 18, 1790, the national assembly decreed that hereditary nobility

was an institution incompatible with a free state, and that titles, arms, and liveries should be abolished. Two years later the records of the nobility were burned. A new nobility was created by the emperor Napoleon I. in 1808, with titles descending to the eldest son. The old nobility was again revived at the restoration. All marquises and viscounts are of pre-revolution titles, none having been created in later times.

Commercial pursuits have more or less in different countries been considered incompatible with nobility. In England this was less the case than in France and Germany, where for long a gentleman could not engage in any trade without losing his rank. A sort of commercial "Bürger-Adel," or half-gentleman class, was constituted out of the patrician families of some of the great German cities, particularly Augsburg, Nuremberg, and Frankfort, on whom the emperors bestowed coats-of-arms. In semi-feudal Italy there was on the whole less antagonism between nobility and trade than north of the Alps. The aristocracy of Venice had its origin in commerce; and though untitled, they were among the most distinguished class of nobles in Europe. On the other hand, in Florence, in the 14th c., under a constitution purely mercantile, nobility became a disqualification from holding any office of the state. In order to the enjoyment of civil right, the nobleman had to be struck off the rolls of nobility; and an unpopular plebeian was sometimes ennobled, in order to disfranchise him. A little later there grew up, side by side with the old nobility, a race of plebeian nobles—as the Ricci, the Medici—whose pretensions were originally derived from wealth, and who eventually came to be regarded as aristocrats by the democratic party.

Italian nobility has this peculiarity, that it does not, for the most part, flow from the sovereign, but from the municipal authorities of the towns acting in entire independence of him. The municipalities can confer nobility on whom they please, by inscribing his name in their respective *Libri d'oro*. The registers of nobility of most of the Tuscan towns are deposited in the *Archivio della Nobiltà*, or herald's office, at Florence—an institution created by the first sovereign of the house of Lorraine. The municipalities have, however, no power to confer titles, though at one time several persons, a few Englishmen included, on the strength of their names being in the *Libro d'oro* of Fiesole, assumed the titles of marquis, count, and baron—an abuse put a stop to by the late grand duke of Tuscany. In Rome there is a small number of nobles—as the Colonnas, Caetanis, and Orsinis—who hold their fiefs as sovereign princes; the rest of the nobility, many of them of very ancient lineage, are municipal, the power of creation being vested in the senator, himself a nominee of the pontiff, and the *Conservatori*, chosen by lot from the Capitoline nobles. In last century so many undistinguished persons had been added to the roll of nobility, that pope Benedict XIV. found it necessary to prohibit by a bull the admission of any one whose ancestors had not filled certain high offices in the state. The same decree limited the number of noble families to 187, designed the *Patriziato Romano*, out of whom 60 of the oldest and most illustrious were chosen as *Nobili Conscritti*, otherwise called the capitoline nobles, and restricted the admission to the patriziato for the future to persons who had rendered important services to the city, and whose names were approved by the *Congregazione araldica*, an exception being made in favor of members of the reigning pontiff's family. As the families of the conscritti became extinct, other patrician families, designated *Nobili Ascritti*, were added by the municipality to make up the number. The titles at present borne by the Roman nobility are: 1. Prince or duke, generally so called, but officially designed "barone Romano"—a title acquired by the Borghesi, Rospigliosi, and others from popes of their respective families; in the case of the Colonnas, Dorias, Odescalchi, etc., from royal or imperial erection; and in other instances—as the Caetani and Massimi—from investiture by the pope as a temporal sovereign. 2. Marquis and count; many of these are provincial nobles, with titles generally derived from small feudal tenures, of which, in some instances, it would be difficult to show the diploma, or point out the period of creation. In some parts of the Papal States it is understood that every head of a noble house is a marquis; and in the march of Ancona, Sixtus V. conferred the right to bear the title of count on all who were of noble blood at the period. 3. Knights (*cavalieri*), a designation given to all who wear a Roman order, to knights of Malta, and generally to younger sons of the titled nobility. 4. Princes, who, with the sanction of the pope, have purchased honors along with ancient fiefs, that carried with them ducal or princely titles, most of them *novi homines*, as the Torlonias. Titles do not descend to the younger members of the family; it is the general usage for the head of the house to bear the most ancient title, while the eldest son, on his marriage, assumes the second in point of antiquity. The title is sometimes the family name, sometimes the name of a feudal possession. The proper designation of the younger branches of titled families is "dei principi," "dei duchi," "dei marchesi," etc.

The nobility of Spain boasts of a special antiquity and purity of blood, a descent from warriors and conquerors alone, without the infusion of any of the elements derived from the church, law, and commerce that are to be found in other countries. "Hidalgo" (*hijo d'algo*, son of somebody, not *filius nullius*) is a term which implies gentility or nobility. The hidalgo alone has in strictness a right to the title "don," which, like "sir" of our knights and baronets, requires the adjunct of the Christian name. When the Christian name is omitted, the title "señor" instead is prefixed with the addition of "de." "Don" has latterly been used by persons who have no proper claim to it about as extensively as "esquire" in England. Hidalguia, till recently, conferred important privileges

and immunities. The higher nobility are styled grandees; formerly the title was "rico-hombre," and the ceremonial of creation consisted in granting the right of assuming the pennon and caldron (*peñon y caldera*)—the one the rallying ensign of command, the other of maintenance of followers. In contradistinction from the grandees, the class of nobility below them are called "los Titulados de Castilla." Red blood is said to flow in the veins of the hidalgo, blue in that of the grandee. Formerly there were three classes of grandees, whose mark of distinction was this—that a grandee of the first class was entitled to put on his hat in the royal presence before the king spoke to him; the second, after the king spoke to him; the third, after the king had spoken and he had replied. The second and third classes are now absorbed into the first. Of the grandees, some bear the title of duke, some of marquis, some of count; but it is the ambition of every grandee to unite in himself as many grandeeships, or have as many *hats*, as the phrase is, as he can. This is effected by the marriage of heiresses through whom *grandezza* descends, and whose names and titles are assumed by their husbands. An enormous accumulation of titles is sometimes found in the person of one grandee. Titles as well as estates go only to heirs of entail. The titulars of Castile are designed "vuestra señoria;" in common parlance, "ucia." The title of baron is little used in Spain. Physically and mentally, the grandees have degenerated from their ancestors, and they have not the influence at court and in the country which landed property ought to give them. Most of them reside at Madrid, clinging to their nominal rank and real nullity, while they are practically excluded from all the functions of state.

In Russia what nobility existed before Peter the Great was of a patriarchal not a feudal kind; but in his anxiety to assimilate everything to a western standard, the czar took the existing aristocracies of states quite differently situated as the model to which to approximate the fortunate of his own subjects. The Russian nobles have ever since been enlarging their privileges by encroachments on those under them. Before Moscow was burned, the mass of the nobles connected with the court lived there in great splendor, and along with their domestic serfs constituted half the population of that city.

The preservation of noble blood, untainted by plebeian intermixture, has often been reckoned a matter of much moment. In Spain most of all this purity of lineage has been jealously guarded. In the German empire no succession was allowed to feus holding immediately of the emperor, unless both parents belonged to the higher nobility. In France the offspring of a gentleman by a plebeian mother was noble in a question of inheritance or exemption from tribute, but could not be received into any order of chivalry. Letters of nobility were sometimes granted to reinstate persons in this position. It is in Germany still important for many purposes to possess eight or sixteen quarterings, i.e., to be able to show purity of blood for four or five generations, the father and mother, the two grandmothers, the four great-grandmothers; and also, in case of the sixteen quarterings, the eight great-great-grandmothers, having all been entitled to coat-armor. Among the higher grades of the peerage in England, a considerable number may be pointed out who do not possess this complete nobility. It is in Scotland more usual and more regarded, both among peers and untitled gentry, where the eight or sixteen quarterings are still in use to be displayed on the funeral escutcheon. At some of the minor German courts, the sixteen quarterings were not unfrequently an illusion, diplomas being granted in the absence of a full pedigree, to declare the parties as noble as if they had had sixteen ancestors.

NOBLE, a co. in n.e. Indiana, intersected by the Lake Shore and Michigan Southern railroad, the Grand Rapids and Indiana, and the Chicago division of the Baltimore and Ohio railroad, with junctions at Kendallville and Avilla; 420 sq.m.; pop. '80, 23,007—21,495 of American birth, 47 colored. It is drained by Elkhart river and Blue creek. Its surface is largely prairie, with groves of building timber and sugar maple trees. Its soil is fertile and produces live stock, grain, dairy products, fruit, and maple sugar. Its most important industries are the manufacture of carriages, furniture, iron castings, leather, cigars, and harness. It has flour and saw mills, woolen factories, foundries, and machine shops. Co. seat, Albion.

NOBLE, a co. in s.e. Ohio, intersected by the Marietta, Pittsburg and Cleveland railroad, drained by Seneca and other small creeks; 400 sq.m.; pop. '80, 21,137—20,592 of American birth, 94 colored. Its surface is well timbered, and undulating; its mineral products are coal, limestone used for building purposes, petroleum, iron ore, and salt. Its soil is fertile. Live stock is raised; also tobacco, wool, grain, dairy products, and sorghum. It has flour and saw mills, and its most important industries are the manufacture of saddlery and harness, sashes, doors and blinds, and woolen goods. Co. seat, Caldwell.

NOBLE, Louis Legrand, b. in Otsego co., N. Y., 1811; educated in the Episcopal theological seminary of New York; rector in North Carolina till 1844; and afterwards at Catskill on the Hudson. He was literary executor of Thomas Cole, the landscape painter, and published a memoir of that artist, New York, 1853. In 1854 he was called to Chicago; in 1858 to Jersey City; in 1860 accompanied the painter Church to the Arctic regions; and published *After Icebergs with a Painter* in 1861. In 1874 he was made professor of the English language and literature at St. Stephen's college at Annandale on the

Hudson. A collection of his poems has been published under the title of *The Hours and other Poems*, 1857.

NOBLES, a co. in s.w. Minnesota, has the state line of Iowa for its s. boundary; 720 sq.m.; pop. '80, 4,435—3,384 of American birth. It is intersected by the Sioux City and St. Paul railroad. It is drained by the head-waters of the Des Moines, Rock, and Little Sioux rivers, and several lakes, lake Graham and Okabena lake being the largest. Its surface is rolling, poorly timbered, and has a soil adapted to the cultivation of grain. It embraces some of the highest land in the state, being in its s. portion 1607 ft. above the level of the sea. Some attention is paid to the raising of stock. Co. seat, Worthington.

NOBUNA'GA, 1533–82; b. Japan; a member of the Ota family, and son of a great landed proprietor. A civil war was raging in Japan at the beginning of his career, and he at first adhered to the shogun, but afterwards fought against and deposed him. He governed Japan, as vice-gerent of the mikado, till 1582, when he was attacked by one of his generals in his own residence, and committed suicide. He was bitterly hostile to Buddhism, and favored the Portuguese Jesuit missionaries, who came to Japan for the first time in his reign. Nobunaga was really hostile to the Jesuits also; but he used them to reduce the power of the bonzes. The Japanese Buddhist sects were then rich and powerful; they hired armies, and continually interfered in politics. In 1571 Nobunaga destroyed the great Buddhist monastery of Hiyeizan, where he burned several hundred temples, and killed all the bonzes and their adherents and families. Soon afterwards the fortified monastery of Ozaka surrendered to him. This persecution broke the power of Japanese Buddhism.

NOCE'RA, or NOCERA DEI PAGA'NI, a t. of s. Italy, in the province of Salerno, 8 m. n.w. of the town of Salerno, and on the highway from that town to Naples. It carries on linen and woolen manufactures. Pop. 8,519.

NOCTES AMBROSIANÆ, the fanciful name of a long series of critical, political, and poetical disquisitions in dialogue published in *Blackwood's Magazine*, and purporting to be the verbatim report of the meetings at Ambrose's tavern, Edinburgh, and elsewhere, of several of the literary celebrities of the day. They were almost entirely the work of "Christopher North," John Wilson (q.v.). The only foundation for the thread of connection and assumption of different personalities is that the first of the papers was written by Lockhart, after some such meeting at Ambrose's as is described. This was in 1822, and in 1825 Wilson began to publish the *Noctes* in regular succession. Of the seventy printed up to 1836, at least sixty are by his pen. For the part supposed to be taken by Hogg, the Ettrick Shepherd, there was no foundation in fact. The work is described by lord Cockburn as "a most singular and delightful outpouring of criticism, politics, and descriptions of feeling, character, and scenery. . . . . It breathes the very essence of the bacchanalian revel of clever men." The papers are not, however, free from the charge of coarseness, are very personal, bitterly and abusively tory, and have, of course, lost much of their interest from their local and ephemeral nature.

NOCTILIONIDÆ, a family of insectivorous bats, inhabiting tropical regions of both hemispheres. Their habits are not well known. The members of the genus *noctules* of South America are commonly known as "bull-dog bats" on account of their short thick muzzles, which in some species are cleft like the lip of a hare. The tail sometimes projects behind the membrane which connects the hind legs, and the claws of the hind-feet are large and strong. The length of the body is 4 or 5 in., and the spread of the wings about 18 inches. An East Indian genus, *dysopus*, has a spread of wing of two feet, and the hinder thumb is placed at a distance from the rest of the toes, similar to the arrangement in the quadrumana. In this genus the tail is short and the membrane connecting the hind legs is very small. The *cheiroptera* are variously classified. M. Lesson placed the *noctilionidæ* as a sub-family of *vespertilionidæ*, under the name *noctilionina*, consisting of ten genera—*noctilio*, *dysopes*, *mollossus* (q.v.), *cheiromedes*, *nyctinomus*, *dinops*, *stenoderma*, *celæno*, *œllo*, and *scotophilus*. The frugivorous (fruit-eating) bats were also placed as a sub-family of vespertilionidæ (see BAT) by M. Lesson and others; but they are now usually classed apart, the order cheiroptera being divided into two sections, *insectivora* and *frugivora*, the insectivora comprising four families: *vespertilionidæ*, *rhinolophidæ*, *noctilionidæ*, and *phyllostomidæ* (see Phyllostoma in art. VAMPIRE; also SPECTER BAT, *ante*). The frugivora embrace only one family, the *pteropidæ* (q.v.), or the fox bats, including several genera. In the classification of Linnæus the vespertilionidæ were equivalent to our cheiroptera.

NOCTILUCINE, an organic substance supposed to be the cause of many of the phenomena of phosphorescence in fish, insects, and decaying matter. The name was given by Dr. Phipson, after a long series of investigations. Some of his earlier observations are mentioned in this work. See LUMINOSITY OF ORGANIC BEINGS, *ante*. Noctilucine has a syrupy consistence at ordinary temperatures, and a whitish color. It is said to be secreted in a pure form by the luminous centipede. Its spectrum is nearly monochromatic. Its luminosity appears to be owing to oxidation, and it is more luminous in ozone or allotropic oxygen than in normal oxygen. When moist it gives off carbonic acid as the result of oxidation. It is slightly soluble in water, but insoluble in alcohol and ether.

NOC'TULE, *Vespertilio noctula*, the largest British species of bat (q.v.), being nearly three inches long without the tail, which is fully an inch and a half. The ears are oval-triangular, shorter than the head: the muzzle is short and blunt. The noctule is only seen on the wing during a short part of the year, retiring early in autumn to hollow trees, caves, or under the eaves of buildings, where many are sometimes found together.

NOC'TURN (Lat. *nocturnum*, recited "by night"). Under the head Breviary (q.v.) has been explained the general order of the services of the canonical hours in the Roman Catholic church. The service of MATINS on Sundays and festivals is divided into three nocturns, each of which consists of three (or more) psalms and three *lessons*. The lessons are either from the Scriptures, from the life of a saint, or from a homily of some father. The name is derived from the recitation of the service "by night."

NODAWAY, a co. in n.w. Missouri, has the state line of Iowa for its n. boundary; intersected by the Nodaway river, forming its s.w. boundary; 900 sq.m.; pop. '80, 29,560—27,936 of American birth, 113 colored. It is drained by the One Hundred and Two and Little Platte rivers, and traversed centrally by the Kansas City, St. Joseph's, and Council Bluffs railroad. Its surface is uneven, having a good supply of timber, and lumber is one of its chief commodities. Its soil is fertile, and its inhabitants are principally engaged in farming and the raising of live stock. Its productions include Indian corn, wheat, oats, wool, pork, honey, and sorghum. Its leading industries are the manufacture of saddlery and harness, metallic ware, and bricks, and it has saw and grist mills. Co. seat, Maryville.

NODAL POINTS, LINES, AND SECTIONS. When a string or metallic cord, under strong tension, is made to vibrate, we hear, besides the principal sound, several secondary and shriller sounds; these are denominated harmonic sounds, and are produced each by a certain portion of the cord which vibrates independently. Further investigation has shown that every vibrating string is divided into a number of portions alternately vibrating in opposite directions, and that the points which separate these portions from each other are at rest. These points are known as *nodal points*, and their situation may be found by placing small pieces of paper on an extended string, and causing it to vibrate; the points from which the pieces of paper have not been displaced are the nodal points. If a plate of glass or metal be held in the hand, and a well-resined fiddle-bow be drawn across the edge, particles of fine dust, previously placed on the plate, will arrange themselves in lines, showing that along these lines no vibration has taken place; these lines are *nodal lines*, and are found in most cases to group themselves together into geometrical figures, and occasionally to present the most beautiful designs. The arrangement of the nodal lines depends on the point by which the plate is held, and on the form of the plate itself. Similarly, if a column of air in a wholly or partially closed tube be acted upon by the force of the breath applied through a hole at any point in its length, the column will divide itself into cylindrical portions each in a state of vibration, and separated from one another by transverse sectional portions in which the air is at rest; these latter sections are known as *nodal sections*.

NODDY, *Megalopterus* or *Anöus*, a genus of birds of the family *laridæ*, differing from terns in having the bill slightly angular, thus exhibiting an approach to gulls, and the tail not forked but somewhat wedge-shaped. Only one species is known (*M.* or *A. stolidus*), a bird widely diffused both in the northern and southern hemispheres, and familiar to sailors, not only as often seen skimming over the water in quest of fishes, but also as not unfrequently alighting on vessels, and, particularly during the night, suffering itself to be taken by the hand. At its breeding-places also, where not accustomed to the visits of man, it scarcely gets out of the way, and the female sits undisturbed on the nest. Hence it commonly shares with the booby the reputation of unusual stupidity. It is about 15 or 16 in. long, from the tip of the bill to the end of the tail, the general color being a brownish-black. The noddy is a rare visitant of the British shores, but is very abundant in warmer latitudes; and on some of the *keys* of the West Indies, and other islets of different parts of the world, it breeds in immense numbers. Particular islets seem to be specially selected as the breeding-places of noddies; and there their nests are sometimes so closely placed that it is not easy to walk among them. Each nest generally contains three eggs about two inches long, which are very good to eat, and are in some places collected in great numbers.

NODES, in astronomy, are the two points in which the orbit of a planet intersects the plane of the ecliptic, the one through which the planet passes from the s. to the n. side of the ecliptic being called the *ascending node* (☊), and the other the *descending node* (☋). As all the bodies of the solar system, whether planets or comets, move in orbits variously inclined to the ecliptic, the orbit of each possesses two nodes, and a line drawn joining these two points is called the *line of nodes* of each body. It is scarcely necessary to add that, as the earth moves in the plane of the ecliptic, she has no nodes. The places of the nodes are not fixed points on the plane of the ecliptic, but are in a constant state of fluctuation, sometimes *advancing* (eastward), and at other times *receding* (moving westward). This motion is produced by the mutual attractions of the planets, which tend to draw each of them out of the plane of its orbit; and it depends upon the relative positions of the planets with respect to another planet whether that planet's nodes shall

advance or recede. On the whole, however, the majority of possible "relative positions," or *configurations*, as they are called, is in favor of a retrograde motion; and we find by observation that, in an average of many revolutions round the sun, a constant retrogradation of the node takes place. The determination of this retrogradation in the case of the planets is a most complicated problem, as the separate action of each on the others has to be taken into account; but in the case of the moon's nodes, the immensely preponderating attraction of the earth, and its great relative magnitude as compared with the moon, enable us to throw out of account any other disturbing influence, and at the same time to exhibit clearly the cause of this motion of the nodes. Suppose the moon to have attained her greatest n. latitude, and to be descending towards the ecliptic, and the earth to be in longitude between her and her previous descending node, then the earth's attraction will tend to *depress* the moon's orbit, and cause her to descend to the plane of the ecliptic sooner than she would otherwise have done; in this case we have a retrogradation of the node. Again, supposing the moon placed as before, but the earth in advance of the line of nodes, then the earth's attraction will tend to draw the moon forward in her orbit so as to meet the ecliptic in a point beyond the previous descending node; in this case, the moon's node has advanced. As in the case of the planets, however, the retrograding tendency preponderates. The average annual retrogradation of the nodes is very small in the case of the planets, but considerable in that of the moon. See MOON. In calculating the courses of the planets, the "length" of the ascending node, or its distance in longitude from the vernal equinox, is a most important element. See ORBIT.

NODES, in botany. See STEM.

NODES are swellings, most commonly of an oblong form, which occur on superficial bones, such as the tibia, ulna, clavicle, and frontal bone, and are due to a syphilitic taint, to scrofula, or to rheumatism. Their immediate cause is the infiltration of lymph or serum into the periosteum, or between it and the bone. The treatment depends so essentially on the constitution of the patient, and the primary cause of the swelling, that it would be inexpedient to enter into any detail regarding it.

NODIER, CHARLES E., an eminent French litterateur, was b. at Besançon, April 29, 1783; other authorities give 1780 and 1781. His father was a distinguished lawyer, who warmly embraced the side of the revolution, and brought up his son in the same principles. At the age of 12 he was a member of the famous society of *Amis de la Constitution*, and hated tyranny with a most ideal and classical hatred: but he soon afterward became a royalist; then again, under Napoleon, a republican; and indeed during his whole career showed a want of that robust opinionativeness without which it is impossible for a man to become a genuine politician. He died—after a life of the hardest literary work, in which time, and even admirable talents, were wasted on inferior subjects—Jan. 27, 1844. Besides editions of the French classics, grammatical, lexicographical, and poetical works, he wrote numerous tales and memoirs. A portion of his writings was collected and published in 12 vols. at Paris, 1832–34, under the incorrect title of *Œuvres Complètes*.

NOÉ, AMADÉE DE. See CHAM.

NOEL, BAPTIST WRIOTHESLEY, The Honorable, 1799–1873; b. England; educated at Cambridge, and ordained in the church of England. He was appointed chaplain to the queen, and as pastor of St. John's chapel, London, became one of the most popular preachers in England. In 1848, having become a believer in immersion, he left the English church and was baptized, and became a Baptist minister. He defended his course in his *Essay on the Union of Church and State*, and in his treatise on *Christian Baptism*. Among his numerous works may be mentioned: *Sermons on the First Five Centuries of the Church*, 1839; *Protestant Thoughts in Rhyme*, 1845; *Christianity Compared with Unitarianism*, 1851; *Essay on the Duty of Englishmen to the Hindus*, 1858; *and Freedom and Slavery in the United States of America*, 1863.

NOE'TIANS. See PATRIPASSIANS.

NOGENT LE ROTROU, a t. of France, in the department of Eure-et-Loir, is situated in a pretty vale on the Huisne, 32 m. w.s.w. of Chartres. It is a station on the Great Western railway from Paris to Rennes in Brittany. Pop. 80, 7,000. Nogent le Rotrou is a long, well-built town, with a ruined castle in the Gothic style, the residence of the great Sully.

NOGGING. Brickwork built in the panels of a timber-framed house. Nogging-pieces are horizontal timbers, introduced to strengthen the brickwork.

NÓGRÁD, a co. in n.w. Hungary, touching the Danube on the s.w., and drained by the Eipel, which empties into the Danube, and the Zagyva, a tributary of the Theiss; 1685 sq.m.; pop. '70, 198,269, partly German. It is mountainous in the n. and, excepting a few fertile valleys, generally barren. Lumber, sheep-raising, and the manufacturing of woolen goods are the principal interests. Capital, Ballassa-Gyarmath.

NOILS, a technical term employed for the short and broken hairs which are removed from wool in the process of combing and preparing it for worsted manufactures. The *noils* are used for making inferior yarns, and are valuable for *felting* purposes, in which they are largely employed.

NOISE. See DEADENING OF NOISE.

NO'LA, an episcopal city of s. Italy, in the province of Caserta, 16 m. e.n.e. of Naples, is built on the site of one of the oldest cities of Campania. The ancient Nola was founded by the Ausonians, and fell into the hands of the Romans in the Samnite war, 313 B.C. For its protection, Marcellus in the second Punic war fought in its vicinity the first battles in which the Romans were victorious over Hannibal. Augustus died at Nola, 14 A.D. The first bells for Christian churches are said to have been cast here in the 5th century. See BELL. Numerous coins, and beautiful vases made of a pale-yellow clay, with figures painted in crimson and maroon, and supposed to have been manufactured here by potters from Corinth, have been found in the vicinity. Nola was a flourishing city in the middle ages, and has (1871) a pop. of 9,128, or with suburbs, 10,771.

NOLAN: co., Tex. See page 890.

NÖLDEKE, THEODOR, 1836–75; b. Germany; educated at Göttingen, where he manifested a taste for oriental studies, in which he soon became proficient. He was appointed professor in the university of Kiel in 1864, and remained there till 1872, when he was called to a chair at Strasburg. His studies were directed mainly to the Hebrew and Syriac languages, and to Arabian literature, and the history of Islamism. Among his works may be mention a *History of the Koran*, 1860; *Life of Mohammed*, 1863; *Contributions to a Knowledge of Ancient Arabian Poetry*, 1864; *The Literature of the Old Testament*, 1868; *Critical Researches on the Old Testament*, 1869; and *The Inscription of King Mesa of Moab*, 1870.

NO'LI ME TAN'GERÉ, a popular name for one form of the disease which has been already described under the term lupus (q.v.).

NOLLE PROSEQUI, a term used in English law to denote that the plaintiff does not intend to go further with the action, or part of the action, in which case he enters or files a memorandum, called a nolle prosequi, after which the action or part of the action is at an end on that point, and the defendant is entitled to his costs thereon.

NOLLE PROSEQUI, an entry upon the records of a court by the plaintiff in a civil, or the prosecutor in a criminal cause, declaring that the proceedings against the defendant shall be discontinued. In a criminal case a *nolle prosequi* may be entered at any time before a jury is impaneled without the defendant's consent, but not afterwards without his consent. A *nolle prosequi* is not equivalent to an acquittal, but acts merely as a stay of proceedings, and the defendant is liable at any time to be re-indicted. It may be entered as to one of several defendants, and is often done so to allow his testimony to be introduced against the others. It is generally in the discretion of the prosecuting officer to enter a *nolle prosequi*, but in some states leave must be obtained from the court.

NOLLEKENS, JOSEPH, was b. in London in 1737. His father, who was from Antwerp, and by profession a painter, died when he was young, and his mother, a Frenchwoman, not remaining long a widow, he received but little education. Being placed in the studio of Scheemakers, the sculptor, in Vine street, Piccadilly, he worked hard and made such progress that in 1759 the society of arts awarded him fifteen guineas for a group in clay; in 1760 thirty guineas for a bas-relief; and during the same year, ten guineas for a model in clay of a dancing faun. Soon after this Nollekens set out for Rome. He was then in his 23d year; his purse was light, he had no patron to support him; but he was independent in spirit, and had been trained to habits of economy. A bas-relief he carved in stone brought him ten guineas from England, and the society of arts voted him fifty guineas for his group in marble of Timoclea before Alexander. But one of the most important events for him, after settling in Rome, was his meeting Garriek in the Vatican, who immediately recognized his countryman as the young sculptor to whom the prizes had been awarded by the society of arts, sat to him for his bust, and paid him handsomely for it. This was the first bust he had been commissioned to model, and it gave him the opportunity of proving where his strength lay. He also executed in Rome a bust of Sterne in terra cotta, which added greatly to his reputation. After residing 10 years in Rome he returned to London, took a lease of extensive premises in Mortimer street, where he set up his studio; and the reputation he had acquired in Rome was such that he immediately had full employment, and within a year (in 1771) was elected an associate of the academy, and a royal academician the following year. His forte was in modeling busts. Into these he infused much truth and character, and he has handed down the likenesses of most of the important personages who figured in this country in the end of the last and at the commencement of this century—of Samuel Johnson, who was his friend and frequent visitor—of Fox, Pitt, and other political characters. George III. also sat to him; and his manner, which exhibited pretty strongly what is popularly set down as blunt and manly English character, made him a great favorite with the king. Besides busts, Nollekens executed numerous commissions for public monuments and statues. He was selected by the academy, with whom the choice lay, to execute the government commission of a monument to the three captains, Manners, Bayne, and Blair, who fell in Rodney's great battle of April 12, 1782; but in this he did not rise above the allegories of Neptune and his sea-horse, and Britannia and her lion. His statue of Pitt for Cambridge was much praised at the time. He also executed, either in the course of his studies, or to meet the views of those connoisseurs

who advocate high art, a considerable number of classical and mythologieal statues and groups, a faun, a Bacchus, five Venuses, Cupid and Psyche, Pætus and Arria, etc. He died in London, April 23, 1823. His wife, to whom he had been long married, and who had brought him some fortune, died a few years before him. He had no children, and his great wealth, upwards of £200,000, was left to certain friends, burdened with some legacies and annuities to his old assistants and servants.—See Cunningham's *Lives of British Artists, etc.*

NO'MADS (Gr. *nemein*, to tend or feed), the name given (originally by the Greeks) to those tribes which, depending chiefly on their flocks and herds, have no fixed habitation, but move about for convenience of pasture. The nomad tribes are of a higher grade of civilization than those that live by hunting and fishing, but much inferior to those engaged in agriculture and manufactures. They are very generally addicted to robbery, and readily engage in aggressive war, so that they have frequently become conquerors of extensive cultivated countries, as in the instances of the Huns, Arabs, and Tartars. There are now few nomads in Europe, and these only in the steppes near the Black sea, and the regions of the utmost north, where cultivation is impossible. Almost all the Finnish, Mongolian, and Turkish tribes, and the tribes formed by mixture of these races, in the steppes and deserts of central and northern Asia are nomads, also the Kurds and the Bedouins, many of the tribes of Africa, and the Gauchos and some of the other Indian tribes in North and South Ameriea.

NOM'BRÉ DE DIOS, a t. of Mexico, 35 m. s.e. from Durango, in a mountainous district. Near it are rich silver mines. Pop. 7,000.

NOM'BRIL POINT, in heraldry. See Escutcheon.

NOME, a term used in the ancient Greek music to denote any melody determined by inviolable rules.

NOMENCLATURE, Chemical. See Chemistry, *ante.*

NOMINALISM. This word refers to a celebrated controversy of the middle ages, respecting the nature of our general or abstract ideas. It was contended by some that abstractions—as a circle in the abstract, beauty, right—had a real existence apart from round things, beautiful objects, right actions. This was called realism. Those that held the opposite view were called Nominalists, because they maintained that there is nothing general but *names;* the name "circle" is applied to everything that is round, and is a general name; but no independent fact or property exists corresponding to the name. There is nothing in a general name, they say, but a declaration of resemblance among a number of things; all things that the name is applied to, resemble one another in some point, which point of resemblance the mind can consider apart from the points of difference; this act of isolated consideration being what is called the power of abstraction. We can be engaged in thinking of the smell of a rose, we can compare it with other sweet odors, and speculate as to the nature of the material that gives the odor, or as to the pleasure that we derive from it; all this is a process of abstract thinking, but it would not of itself suffice to prove that the odor has a separate existence. We might also confine our attention to the mere form, or outline of the rose, and compare it with other forms; but we should be still less able to affirm the independent existence of this particular form.

Realism must be traced back to Plato's system of ideas, or the eternal and independent existence of general attributes, from which the concrete embodiments were derived. There existed in the Divine Mind, according to Plato, patterns, models, or archetypes, according to which individuals were formed. The archetype circle was the origin of all actual round things. Aristotle denied the separate existence of these general forms, and held that they existed only in connection with matter, or with objects in the concrete. The Stoics repudiated universals in both senses. The Aristotelian view constituted the scholastic realism, and prevailed until the 11th c., when a re-action took place in favor of the Stoical doctrine, headed by Roscelin of Compiègne and John the sophist. This was the commencement of Nominalism. The celebrated Abelard was a disciple of Roscelin, and induced large numbers to depart from the realistic notions, which were identified at the time with religious orthodoxy. The controversy raged with great violence through the 12th century. Thomas Aquinas and Duns Scotus, in the following century gave their powerful adhesion to realism. In the 14th c. William Occam, an English Franciscan friar, and a pupil of Scotus, revived the advocacy of Nominalism, which was once more maintained by a number of eminent men, in spite of the hostility of the church, carried the length of persecution. The controversy subsided at the reformation.

A middle view between Nominalism and Realism was held by a few persons when the contest was at its height; which was, that although general properties have no separate existence in nature, they can be conceived in the mind apart from any concrete embodiment. Thus we may form an idea of a circle, irrespective of any individual round body. This view is specious, and is tacitly implied in many opinions that have never ceased to be held. See Generalization.

NOMINATIVE. See Declension.

NON-APPEARANCE, the term used in the law of England to denote that a party against whom an action or suit has been commenced has not entered an appearance,

which is the way by which he comes before the court to defend is right. In many cases, if he does not appear, the suit will go on in his absence, provided he was duly served with the writ of summons or bill.

NON-ASSUMPSIT, is in English law the usual plea or defense to an action for breach of a contract not by deed, and means that the defendant denies that he broke the contract, or that there was any contract.

NON-COMMISSIONED OFFICERS, in the British army, constitute a numerous and very important class in the regimental system between the commissioned officers and the men. As the former are not permitted to mix with the private soldiers, lest familiarity should diminish the sway of absolute discipline, it is necessary to have an intermediate class to overlook the men in their barracks and at all times when off the parade. None are so suited for this duty as the best conducted of the men themselves, who are promoted by selection to non-commissioned rank, and hold many privileges and powers unattainable by the privates. The non-commissioned officers comprise the sergeants-major, all the sergeants, the trumpeters, drummers, and buglers, and, in the life guards, and royal horse guards only, the corporals. They can be reduced to the ranks by sentence of a court-martial, or by their colonel-commandant; but not by a lieut.col. nor by any junior officer. Non-commissioned officers are entitled to quarters for their wives, or lodging-money in lieu of quarters. Accustomed themselves to obey, the non-commissioned officers are admirable assistants in preserving discipline; veterans, to whom military life is a second nature, they are looked up to by their comrades as examples, to lead in battle or to teach in drill. The non-commissioned officers have a mess (q.v.) to themselves. In a battalion of infantry at home, there were, in 1882, 58 non-commissioned officers to 550 rank and file; in India, 66 to 820; but the rank and file may be greatly augmented without affecting the number of non-commissioned officers. In the whole British army (European) for the year 1882–83, there were 22,331 non-commissioned officers. This rank is a necessity in all armies; in France, the non-commissioned officers are termed *sous-officers;* in Germany, *unter-offizieren.*

NON COMPOS MENTIS. See INSANITY, BEFORE THE LAW.

NONCONFORMISTS, a name sometimes given generally to all sectaries who, at any period in English history since the establishment of Protestanism, have refused to conform to the doctrine and practices of the Episcopal church. It is, however, more frequently used in a restricted sense to denote the 2,000 clergymen who in 1662—two years after the restoration—left the church of England rather than submit to the conditions of the act of uniformity, which required of every beneficed minister, every fellow of a college, and even every schoolmaster, unfeigned assent to all and everything contained in the book of common prayer. The ejected ministers swelled the ranks of the Presbyterians and Independents, the latter of whom are sometimes called Nonconformists.

NONE (Lat. *nona*, "ninth"), one of the lesser canonical hours (q.v.), so called from its recitation being primitively fixed at the ninth hour.

NON-EFFECTIVE (Fr. *non-activité*), is the term applied to the portion of the personnel of the army or navy not on active service or in immediate readiness for active service. It thus comprises all officers on retired or half-pay, pensioners, and superannuated officers. In a force liable to frequent augmentations and reductions, the non-effective charge must be considerable, and a large retirement is necessary, in order to rapid promotion. The great French war, also, with the reductions following it, bequeathed to the British an annual non-effective charge of several millions, which is not yet wholly expunged. In 1883–84 the non-effective charges were £2,916,800 for the army, and £2,071,400 for the navy, a notably large percentage on the gross cost of the two services.

NON-ENTRY, in the law of Scotland, means that state of a feudal estate when the last vassal has died, and his successor has not been invested or seized of the land. On such an occasion, the superior is entitled to what is called a casualty of non-entry, which consists of the rent of the feu.

NONES. See CALENDS.

NON EST INVENTUS, a technical term used in that part of the law where, after judgment, the sheriff endeavors to arrest a party. If after a reasonable search he cannot find the debtor, he makes a return to the court that he has not been able to find the debtor, which is shortly called a return of *non est inventus*, and his duty is then discharged until a fresh writ is issued to him.

NONFEASANCE, in certain parts of the law of England, means the not doing what one is bound to do.

NONJOINDER, in English law, is the omitting to join all the parties to the action or suit

NONJURORS, the name given to that portion of the Episcopal clergy of England who at the coronation of William and Mary refused to take the oath of allegiance to these sovereigns, believing that they had unlawfully possessed themselves of the throne abdicated by James II. They were great champions of the doctrine of passive obedience on the part of subjects towards kings; and as the triumph of the prince of Orange was obtained at the expense of that doctrine, it was impossible that they could, consistently

with their antecedents, acknowledge him as their rightful king. The house of commons allowed them six months longer than laymen to make up their minds, but declined to adopt the amendment of the lords, viz., that the oath should not be imposed on the clergy. They refused, and were consequently deprived of their sees and benefices. The non-jurors comprised Archbishop Sancroft, 8 bishops, and about 400 of the inferior clergy.

NON-RESIDENCE, the name given in church law to the offense of a person holding a spiritual benefice, who absents himself, without legal justification, from the local precincts within which the duties attached to the benefice are prescribed to be performed. The obligation of residence follows clearly from every principle of law; and, from the constant tendency to relaxation on the part of the clergy, has been an unfailing subject of legislation, ecclesiastical and civil, from the very earliest times. The council of Nice in 325, of Antioch in 332, and of Carthage in 401; the constitutions of the popes from the earliest genuine document of that class, the novels of Justinian, the capitularies of Charlemagne—all speak the same language, and enforce it by the same penalties. During the mediæval period, and especially during the unhappy contest of the western schism, great abuses prevailed. The whole substance of the legislation of the Roman church on the subject, however, is compressed in the decrees of the council of Trent, which are mainly contained in the decrees of the XXII. and following sessions, "On Reformation." The decrees of the council regard all church dignitaries, and others charged with the cure of souls. Without entering into the details, it will suffice to say that for all the penalty of absence without just cause, and due permission, consists in the forfeiture of revenues, in a proportion partly varying with the nature of the benefice, partly adjusted according to the duration of the absence. For each class, moreover, a certain time is fixed, beyond which, during twelve months, absence cannot be permitted. The duty is imposed on persons named in the law of reporting to the ecclesiastical superiors cases of prolonged absence. The same legislation has been confirmed by most of the recent concordats, and is enforced by the civil law of each country. In England the penalties for non-residence are regulated by 1 and 2 Vict. c. 106. Under this act an incumbent absenting himself without the bishop's license for a period exceeding three, and not exceeding six months, forfeits one-third of the annual income; if the absence exceed six, and does not exceed eight months, one-half is forfeited; and if it be of the whole year, three-fourths of the income are forfeited. The persons excused from the obligation of residence by the canon law are sick persons, persons engaged in teaching the theological sciences in approved places of study, and canons in immediate attendance upon the bishop ("*canonici a latere*"), who ought not to exceed two in number. By the act 1 and 2 Vict. c. 106, heads of colleges at Oxford and Cambridge, the wardens of Durham university, and the head-masters of Eton, Westminster, and Winchester schools are generally exempted, and temporary exemptions from residence are recognized in other cases, which it would be tedious to detail. In the Roman Catholic church, besides the general legislation, most of the provincial and diocesan statutes contain special provisions on the subject of non-residence.

NONSUIT is a legal term in England, which means that where a plaintiff in a jury trial finds he will lose his case, owing to some defect or accident, he is allowed to be nonsuited, instead of allowing a verdict and judgment to go for the defendant. The consequence is that the plaintiff has to pay the defendant's costs; but he can bring a fresh action if he can get over the difficulty that rendered a nonsuit necessary or expedient.

NONSUIT (*ante*), may be voluntary, as where the plaintiff purposely absents himself in order to abandon his cause and allow a judgment for costs to be entered against him; or involuntary, when, on being called on the trial of the case, plaintiff fails to appear. A nonsuit is no bar to another action for the same cause. In many of the states, and in the U. S. courts, nonsuit cannot be given against a plaintiff who has already given evidence to support his claim, or against his consent, but in others, like New York, where there has been a final submission of the cause, and the evidence is not sufficient to uphold the action, nonsuit may be ordered; while in Alabama the courts cannot enter a nonsuit unless specially authorized to do so by statute. If a nonsuit be rendered on insufficient ground, plaintiff may move to have it set aside.

NOOR-ED-DEEN' MAHMOOD. See NOUREDDIN MAHMÛD, *ante*.

NOOSSA. See MOLUCCAS.

NOOT'KA DOG, a large kind of dog, common in a domesticated state among the natives of the vicinity of Nootka sound. It has erect, pointed ears. It is chiefly remarkable for the extreme abundance of its long woolly hair, which, when shorn off, holds together as a fleece, and is spun and woven into garments. The introduction of this wool-bearing dog into other countries has been suggested, but not yet attempted.

NOOTKAS, or AHTS, a family of Indian tribes, in a province of the Dominion of Canada, on Vancouver island; they gave the name to Nootka sound, on the w. side of the island. They occupy a portion of the main-land near the island. The Ahts proper live on the w. side of the island, and number 3,500. Those called Nootka by capt. Cook are now said to be the Mooachahts. There are also the Quakewlth, subdivided into many tribes, on the w. and e. sides of the island, and on the main-land, which amount

to as many more, and on the e. side of the island the Cowichans number 7,000. The god of the Ahts proper, and the one whom they worship as their progenitor, is Quawteaht; they also worship the sun and moon, and a bird, Totooch, which they believe to be endowed with supernatural powers. The laws governing the tribe are strict and peculiar, especially in regard to consanguinity. A brave cannot marry in his own clan, and the children are claimed by the mother's clan. One member of a clan cannot invite a member of the same clan to a feast; this rule applying to the male sex only, the squaws not being considered in society. They live in houses, the posts of which are set permanently at the stations habitually visited. The posts are set in a row for a distance of about 100 ft., and on either side, about 20 ft. from the central row, are two other rows, attached to it by string-pieces. These are covered with cedar slabs and mats, adjusted at will. Their canoes are convenient dug-outs, capable of transporting houses and household goods. Their chief occupation is fishing—catching salmon, herring, halibut, and occasionally whales. They travel for long distances to go on the hunt in the season, and add to their store by collecting shell-fish, camash roots, and sea-weed. They are ingenious in the manufacture of clothing, making capes of white pine bark, hats of cedar and pine bark, and blankets of cypress bark. They make their own dishes and dippers, of wood, and are accomplished in the art of carving. They wear masks on the war-path, which they carve out of wood, and they ornament their door-posts. They place their dead in boxes and hang them up in the trees or lay them on the ground, and cover them with mounds of sticks and stones. They have a bad reputation among the whites, who have greatly increased since the discovery of gold on the main-land, Their allies, the Cowichans, are partially civilized, doing their own farming and working for the whites; missionaries of all faiths have been encouraged to visit them, and have made a study of their language. A vocabulary of the Aht language is contained in Sproat's *Scenes and Studies of Savage Life.*

NOOTKA SOUND, an inlet on the w. coast of Vancouver island, British North America, in lat. 49° 35′ n., long. 126° 35′ west. Its entrance is protected by an island of the same name, and the sound can be entered on both sides of the island. It extends inland for 10 m. in a n.n.e. direction; but the greatest breadth of water is not more than 500 yards. Numerous small coves and inlets are found around the rocky shores. It affords good anchorage.

NORD, the most northerly department in France (whence its name), corresponding with the former province of French Flanders, and bordering on Belgium and the strait of Dover. Area 2,185 sq.m.; pop. '80, 1,603,259. It is composed of two parts, or at least narrows near the middle at Armentières, on the Lys, almost to a line. It is watered by the Scheldt and the Sambre, with their affluents, and by numerous canals. Next to that of the Seine, it is the most densely peopled department in France. The soil is fertile, well cultivated, and yields more abundant harvests than any other part of the country: 883,606 acres are arable. The principal products are wheat, hemp, beetroot, vegetables, tobacco, and fruits. Manufactures of lace, cambric, linens, and beetroot sugar are extensively carried on. It has a much larger proportion of railways, roads, and canals than any of the other departments, as well as the most important coal and iron mines. No other department has so many populous towns and strong fortresses; none adds so much to the national revenue; in none are the people so intelligent, so susceptible of culture, or so industrious. In respect of its educational and benevolent institutions, as well as of its learned societies, it ranks next to the department of the Seine. The arrondissements are Lille, Douai, Cambrai, Valenciennes, Avesnes, Hazebrouck, and Dunkerque. The chief town is Lille.

NOR'DEN, a t. of Prussia, in the province of Hanover, 72 m. n.w. from Oldenburg, and a few miles from the North sea, with which it is connected by a canal. Pop. '80, 6,617.

NORDENSKJÖLD, Adolf Eric, b. Finland, 1832; educated at Borgo and Helsingfors, and was appointed director of the faculty of mathematics and physics at the latter university, but removed for political reasons in 1855. In 1858 he became state mineralogist at Stockholm. He went with Torell in the Arctic expeditions of 1859 and 1861, and himself led expeditions in 1864, 1868, 1872, and 1875. The expedition of 1868 resulted in accurately fixing the position of Spitzbergen. In 1870 he made a scientific exploration of Greenland. His most important expedition was undertaken in 1878, for the purpose of exploring the n. polar sea from the mouth of the Yenisei e. to Behring strait. He left Gothenburg in July, 1878, and reached Yokohama in Sept., 1879. Nordenskjöld believes that his last voyage has demonstrated that communication by sea for commercial purposes may easily be had between Europe and the Obi-Yenisei; that the voyage from the Atlantic to the Pacific, in the Siberian sea, is practicable, but useless to commerce, and that further exploration is necessary to determine whether sea communication between the Pacific and the mouth of the Lena can be established. He was created a baron in 1880.

NORDERNEY, a small island of the Prussian province of Hanover, lies 3 m. off the coast of East Friesland, and forms one of a string of islands that line that coast. Area about 4 sq.m.; permanent pop. 1770. It has enjoyed, since 1797, a great reputation as

a place for sea-bathing, and in the summer season has from 1600 to 2,000 visitors. The little village at the w. end of the island has a very tastefully built *conversations-haus*, 130 ft. long. Trees do not grow here.

NORDHAUSEN, a flourishing t. of Prussian Saxony, pleasantly situated at the southern base of the Harz mountains, on the Zorge, 38 m. n.n.w. of Erfurt. The surrounding country is very fertile in corn, and in the vicinity commences the *Goldene Aue* (golden plain), a fertile valley watered by the Helme. It contains a gymnasium, numerous churches, one of which, St. Blasius, contains two pictures by Luke Cranach. It carries on a thriving general trade, is the depot from which the Harz mountains are supplied with necessaries, and has most extensive distilleries and considerable manufactures of tobacco, succory, chemicals, cloth, leather, etc. Its spirit distilleries, of which there are 60 in almost constant operation, produce annually for export upwards of 100,000 hogsheads of corn-brandy. Pop. '80, 26,198.

NORDHEIMER, Isaac, ph.d., 1809–42; b. Memelsdorf, Germany, of Jewish parents. Having acquired the rudiments of education at a Jewish school, he entered the gymnasium of Würzburg, to fit himself, by the study of the classics, theology, and philosophy, for a Jewish public teacher. After studying two years at the gymnasium, he was transferred to the university, from which, in 1832, he went to the university of Munich, taking his degree of doctor of philosophy in 1834. Two American students who took private lessons of him in 1832 having informed him that there were favorable openings in America, he left his home in 1835, and soon after his arrival in New York was appointed professor of Arabic and other oriental languages and acting professor of Hebrew in the university of New York. Soon afterwards he was appointed instructor in the Union theological seminary. He was one of the most eminent Hebrew scholars of modern times. He was intimate with Dr. Addison Alexander, Dr. Robinson, and prof. Stuart. On his way to this country he began the preparation of a Hebrew grammar on a philosophical basis. In 1838 he published the first volume, and in 1841 the second. Prof. Alexander, reviewing it, says, "This new work requires no painful effort of memory to keep its parts in order; the perusal in it of the most thorny part of Hebrew grammar opens a vista superior in clearness, extent, and beauty to that exhibited by any other writer. Nothing but the fear of being thought to deal in sweeping panegyric prevents our speaking in the highest terms." Horne styles it "the most elaborate and philosophical Hebrew grammar in the English language." Besides this he published *A Grammatical Analysis of Select Portions of Scripture, or a Chrestomathy; The Philosophy of Ecclesiastes, being an Introduction to the Book of Ecclesiastes*, in the *Biblical Repository*. He contributed other valuable articles to the *Biblical Repository*. He left also the following works in manuscript: *A Chaldee and Syriac Grammar*, in German; *Arabic Grammar*, in German; *A Larger Arabic Grammar*, in English; *A Translation and Exposition of the Book of Ecclesiastes*, in German; *Hebrew Concordance*, incomplete; *Philological Memoranda;* etc. Dr. Nordheimer continued through life in the Jewish faith.

NORDHOFF, Charles; b. Prussia, 1830; came with his parents to the United States in 1835, attended school at Cincinnati, and was apprenticed to a printer at the age of 13. He shipped in the U. S. navy in 1844, and during his service of three years made a voyage around the world. He stayed at sea till 1853, finding employment in the merchant, whaling, and mackerel fishery service. He was then engaged in Philadelphia, and afterward in Indianapolis in a newspaper office. From 1857 to 1861 he was employed by Harper & Brothers in an editorial capacity, and from 1861 to 1871 he was on the staff of the *New York Evening Post*. He visited California in 1871, and on a second trip in 1872 visited the Hawaiian islands. Since then he has been the Washington correspondent of the *New York Herald*, which position he still holds. Among the books he has written are *Man-of-War Life; The Merchant Vessel; Whaling and Fishing* (1856); *Stories of the Island World; Cape Cod and All Along Shore* (1868); *California for Health, Pleasure, and Residence; Northern California, Oregon, and the Sandwich Islands* (1874); *Politics for Young Americans* (1875); and *The Communistic Societies of the United States*. His books have been well received in America; some of them have been reprinted in England, and translations of them have been published in Germany.

NORDKÖPING. See Noerdköping, *ante*.

NORDLINGEN, a t. in the w. of Bavaria, is situated on the river Eger, 44 m. n.w. of Augsburg by the Munich and Nuremberg railway. It has a Gothic church, with a high tower and fine organ, and manufactures of Tyrolese carpets, linens, and woolens, besides a large trade in feathers. Pop. '80, 7,837. Nordlingen is historically interesting as the scene of several battles, the most famous of which was fought, Sept. 6, 1634, between 24,000 Swedes, under count Horn and duke Bernhard of Saxe-Weimar, and 45,000 imperialists under king Ferdinand. The former were defeated with the loss of 12,000 killed and wounded, 300 banners and standards, 80 cannons, and several thousand prisoners, among whom was Horn himself.

NORE is a sand-bank in the estuary of the river Thames, 4 m. n.e. of Sheerness, on which there is a floating light, called the Nore light, in lat. 51° 29′ n., long. 0° 48′ west.

The name, however, is more commonly applied to the portion of the estuary in the vicinity of the Nore light and sand-bank.

NORFOLK, a co. in e. Massachusetts, bounded on the n.e. by Massachusetts bay; drained by the Charles and Neponset rivers; on the Old Colony, the Boston and Providence, and the Boston, Hartford, and Erie railroads; 500 sq.m.; pop. '80, 96,462—76,316 of American birth. The surface is diversified and hilly, and much of it heavily wooded with ash, elm, hickory, oak, and other timber trees. The soil is rocky, but fertile in many portions, producing Indian corn, oats, potatoes, etc. The Quincy quarries afford excellent granite. A large capital is invested in manufactures, and among the articles made are boots and shoes, leather, cotton, woolen, and straw goods, forged and rolled iron, carriages, harness, and metal wares. Co. seat, Dedham.

NORFOLK, a co. in s.e. Virginia, adjoining North Carolina, bounded on the n. and n.e. by Hampton roads and Chesapeake bay; drained by Elizabeth and North rivers and Deep creek; on the Atlantic, Mississippi and Ohio, and Seaboard and Roanoke railroads, and the Dismal Swamp canal; 450 sq.m.; pop. '80, 58,654—57,047 of American birth, 29,423 colored. The surface is level, and heavily wooded with cypress and other trees. A large part of the Dismal swamp lies within this county. The soil is sandy, and the principal productions are Indian corn, potatoes, and sweet potatoes. There are flour and saw mills, and manufactories of machinery, carriages, cars, and metal wares. Co. seat, Norfolk.

NORFOLK, a co. in s. Ontario, Canada; bounded on the s. by lake Erie; drained by tributaries of that lake; situated on the Canada Southern railroad; 635 sq.m.; pop. '81, 33,593, chiefly English, with a considerable admixture of Germans, Scotch, and Irish. The surface is mostly even, and the soil fertile. Co. seat, Simcoe.

NORFOLK, a large and important maritime co. of England, bounded on the n. and n.e. by the North sea, and on the s. by the county of Suffolk. Area 1,356,173 acres; pop. '80, 444,749. Its coast-line, extending from Yarmouth, on the e., to the mouth of the Nen in the Wash, is about 100 m. in length. From Yarmouth to Happisburgh the coast is low and sandy; from Happisburgh to Weybourne it is skirted by low cliffs; and w. of Weybourne to the entrance to the Wash, where the banks are in great part dry at low water, and where a considerable extent of land has been reclaimed from the sea (see Wash), it is low, and covered with sand or shingle. The surface of the county is level, or nearly so, none of the rising grounds being considered worthy of being called hills. The principal rivers are the Ouse, the Yare, with its affluents the Wensum and the Waveney, and the Bure. Communication is kept up by the navigable rivers, and by the Great Eastern railway. The climate is affected in spring particularly by cold n.e. winds, but the air is in general dry and healthy. The soil consists chiefly of light sands and loams, and comprises a great extent of land, which though naturally not fertile, has been made so by judicious management. The agriculture of the county is in an advanced condition, and all the usual crops are extensively grown; while that of barley is especially celebrated. Half the acreage is devoted to rearing food for cattle, and thus the necessary supply of manure is secured. Geese and turkeys are extensively reared for the London market. The county is divided into three parts, n., s., and w. Norfolk, each returning two members to the house of commons. The capital is Norwich.

NORFOLK, a city and port of entry of Virginia, 88 m. s.e. of Richmond, and 32 m. from the ocean. The city is irregularly built on low ground, and contains a city hall, military academy, mechanics' hall, court-house, jail, custom-house, 9 banks, 26 churches. Its large deep harbor is defended by fort Calhoun and fortress Monroe, the largest fortress in America. A government navy-yard, dry dock, and marine hospital are in the suburb of Gosport. Norfolk was built in 1736; in 1776 it was burned by order of lord Dunmore, the British colonial governor. In 1855 a large number of the inhabitants died of yellow fever. In 1884 the exports of Norfolk (including Portsmouth) amounted in value to $12,353,256; and in the same year, the number of vessels belonging to these ports was 477. The pop. in 1870 was 19,229.

NORFOLK (*ante*), the co. seat of Norfolk co., Va., on the Norfolk and Western and the Seaboard and Roanoke railroads, and the Dismal Swamp and the Albemarle and Chesapeake canals; pop. '80, 21,966. It is connected by steamer with New York, Boston, Philadelphia, and Richmond; is the second city in Virginia, has the largest foreign trade of any place in Virginia, and with Portsmouth, on the other side of the river, is the chief U. S. naval station. It is the third cotton port of the U. S.

NORFOLK, Duke of. See Howard, Thomas, *ante*.

NORFOLK ISLAND lies in the Pacific ocean, 1100 m. e.n.e. of Sydney in Australia, in lat. 29° 10′ s., and long. 167° 58′ east. Length, 5 m.; breadth, 2½ m.; area, 8,960 acres. It is the largest of a smaller cluster of islands, comprising Norfolk, Nepean, and Philip islands, together with several rocky islets. The coasts are nigh and steep, and the surface generally uneven, rising in Mount Pitt to upwards of 1000 ft. in height. The soil is fertile and well watered, and the climate healthy. In 1825 Norfolk island was made a penal settlement by the British government for the worst class of convicts sent out to New South Wales; but the experiment was a failure, and the establishment was broken up in

1855. In 1856 the inhabitants of Pitcairn island (q.v.)—194 in number, descendants of the mutineers of the *Bounty*—were transferred hither by the British government. In 1871 the pop. was 481, the Pitcairn community numbering 297.

NO'RIC ALPS. See ALPS.

NOR'ICUM, a province of the Roman empire, corresponding to Bavaria and other parts of the Austro-Hungarian empire; bounded n. by the Danube, e. and s. by Pannonia; also s. by Illyricum and cisalpine Gaul; w. by Vindelicia. The region is mountainous, the Noric Alps stretching through the center of the province; the chief rivers were Œnus (modern Inn), Dravas (Drave), and Murius (Mur). The chief town was Noreia, mentioned by Cæsar in his commentaries. The province was subdued by the generals of Augustus about 13 B.C. The Romans obtained iron and salt from the region, and, it is said, gold.

NO'RIUM is the name assigned by Svanberg to a metal, whose earth (or oxide) is associated with zirconia in certain varieties of the mineral zircon. Its existence is not as yet definitely established.

NORMAL SCHOOLS, institutions where teachers are instructed in the principles of their profession and trained in the practice of it. The name of normal school is of French origin (*École Normale*, from Lat. *norma*, a rule or model), and is that generally used in Scotland; such institutions, in England, are oftener called, "training colleges;" and in Germany "seminaries." That in acquiring knowledge the mind follows certain processes, and that any one imparting knowledge should do so in harmony with these processes, are truths which seem sufficiently obvious. It is only recently, however, that they have secured much attention; and they are even at this day deliberately denied by some men of thought, and of the highest educational position. The recognition of these truths has, however, been sufficiently extensive to secure the institution, in Great Britain, America, France, Germany, and Switzerland, of schools in which the principles of teaching form the subject of study, and in which model specimens of the art are given. Italy, and even Russia, are following in the wake of the countries named. These schools also afford a thorough course of instruction in the subjects which are taught in elementary schools. The only normal school for training the higher class of teachers for colleges and academies exists in Paris.

One of the earliest, if not the earliest, normal school in Great Britain was the sessional school of Edinburgh (1830), afterwards developed into the "general assembly's normal institution." The first attempt of a similar kind in England was that of the Battersea training college, instituted by Mr., afterward sir J. P. K. Shuttleworth and Mr. Tuffnell. Sir J. P. K. Shuttleworth subsequently, acting as secretary to the committee of privy council on education, suggested measures which have resulted in the institution of about fifty colleges for the training of teachers in Great Britain in connection with the Established and Dissenting churches. These turn out hundreds of male and female teachers annually, who having, after a two years' course of training, received government certificates of merit, become teachers of elementary schools.

There has been for some years a reaction against the necessity of normal schools, and their maintenance at the public expense. But this reaction can only be temporary, and the great facts will survive, that every subject of instruction is best taught according to a certain method, and that all methods are based on the study of the human mind. This is a position which it is impossible permanently to shake. The real founders of normal schools are those men who, with more or less clearness and width of view, have brought prominently forward these principles. Such were Plato and Quintilian, in ancient times; in more recent years, the most prominent names have been Comenius, Pestalozzi, Rousseau; and, in our own country, Ascham, Milton, Locke, prof. Pillans, and Dr. Arnold.

NORMAL SCHOOLS (*ante*). The establishment of these schools in the United States is due, it is said, to a suggestion by prof. Denison Olmsted in an oration delivered in New Haven, Conn., in 1816, and to various recommendations in the official messages of De Witt Clinton while governor of New York. In 1838 a gentleman in Massachusetts, Mr. Edmund Dwight, offered $10,000 for the purpose of establishing such a school on condition that the state would appropriate an equal amount. This was accepted and the first school was established at Lexington in July, 1839. Others soon came into existence in Massachusetts and elsewhere; and now nearly every state in the union has one or more either sustained by a county, city, or the state itself. In 1882 the total number of these schools was reported to be 233, the number of instructors connected with them about 1,700, and the students, 51,132. They usually embrace the model or pattern school together with the academical features of the ordinary school. The conditions of admission are about the same in each, and require that the candidate be not less than sixteen years of age, and that he be able to pass a satisfactory examination in reading, spelling, writing, arithmetic, and the elements of English grammar. He must also intend to teach after graduating during a certain specified time. The courses of study are principally limited to the branches required to be taught in the public schools, together with a thorough theoretical and practical preparation for the special duties of a teacher. In some of the schools, however the classics and modern languages are taught. In the accounts of the various states mention will be found of these schools individually.

NORMAN ARCHITECTURE. As its name implies, this style was originated and chiefly used by the Normans. Soon after their conquest of the north of France, they began to erect churches and cathedrals in memory of their victories. Their conquests supplied them with the means for making these large edifices. They were not contented with the small churches then common in France, but desired to erect monuments worthy of their great conquests. They accordingly expanded the dimensions, while to a great extent retaining the style of the buildings they found in France. They seem also to have borrowed some of their ideas from the Rhine. See GOTHIC ARCHITECTURE.

The leading characteristics of their style were size and massiveness. They adopted the old Latin plan (derived from the Basilica) of central and side aisles; and at the east end, they invariably placed a semicircular apse. They seized on the tower as a distinguishing feature, and developed it as their style progressed. The ornaments are simple and of great variety; but the most common and distinctive are the zigzag, billet, chevron, nail-head, etc. The windows and doors are simple, with semicircular arched heads—the former without tracery. The tympanum of the door-arch is occasionally filled with sculpture.

The nave arches are carried sometimes on single pillars, but more frequently, especially as the style advanced, on piers with shafts. The shafts are almost always recessed in nooks (or "nook shafts"). Owing to the great size of the buildings, the architects were unable at first to vault the main aisle, which, accordingly, had usually a wooden roof, the side aisles only being vaulted.

The masonry is rude; the joints being large, and the stones generally unhewn. The style prevailed from about the beginning of the 10th c., till the death of William the conqueror, near the end of the 11th century. There are many examples in Normandy, the churches at Caen being well-known buildings of the date of William.

This style of architecture was brought into England by the Normans at the conquest, 1066. They there extended the scale of the buildings, as they had done in Normandy, preserving, however, many local peculiarities of the Saxon style, which they found in the country. The chapel in the white tower of the tower of London is the earliest example of pure Norman work in England. There are, however, many buildings, both in England and Scotland, which date from before the end of the 12th c., when the pointed style began to be used. Durham, Lindisfarne, Canterbury, Dunfermline are partially Norman, besides many other churches and castles. The Anglo-Norman is heavier than the French-Norman, the cylindrical nave piers of the above buildings being much more massive than those of French works. To relieve this heaviness, the chevron, spiral, and other groovings were cut in the piers. The mouldings and forms of doors, windows, etc., are the same as those of Normandy. There is one remarkable difference in the plans of the early Norman churches in the two countries: in France, the apse at the east end is always semicircular; in England, this form was gradually given up; and towards the end of the style, the square east end was universally adopted.

NORMANBY, CONSTANTINE HENRY PHIPPS, Marquis of 1797–1863, b. England; son of the first earl Mulgrave. He was educated at Harrow and Cambridge, and returned to parliament for Scarborough in 1818. He acted with the liberals, though his family had always been tories; his first speech was in favor of the political claims of the Roman Catholics, and his second advocated lord John Russell's proposals for parliamentary reform. He left parliament, which he re-entered after a residence of two years in Italy. While in the commons, he secured the abolition of the sinecure office of joint postmaster-general, and advocated the extension of the suffrage in the great manufacturing towns. He succeeded to the title in 1831, and soon after was made governor of Jamaica, where he successfully executed the act for the emancipation of the slaves, and suppressed without loss of life a mutiny of the soldiers. Returning to England, he succeeded the earl of Carlisle as lord privy seal in 1834. He was lord-lieutenant of Ireland, 1835–39, displaying an impartiality which won the approbation of O'Connell himself. He was made a marquis at the coronation of Victoria, and was colonial secretary for a short time in 1839, but was soon transferred to the home department, where he remained till 1841. From 1846 to 1852, he was ambassador to France, and from 1852 to 1858, to Tuscany. He published *A Year of Revolution*, 1857, containing his personal observations at Paris, and a number of novels, including *Matilda, Yes and No,* and *The Contrast.*

NORMANDY (Fr. *Normandie*), formerly a province in the north of France, bordering on the English channel; now divided into the departments of Seine-Inférieure, Eure, Orne, Calvados, and Manche. It is in general a very fertile, richly-cultivated land, resembling a garden in many districts. Its chief agricultural products are corn, flax, and fruits (from which cider is largely made); its fisheries and manufactures of great importance, and its horses the best in the kingdom. The inhabitants are for the most part descendants of the old Normans, and bear the stamp of their splendid ancestors. They are intelligent, strongly built, and of a noble and energetic character; warm-hearted and patriotic, they produce the boldest sailors, the most skillful fishermen, agriculturists, cattle-rearers, and gardeners in all France. In the north-eastern and more level part (formerly *Upper Normandy*), the principal towns are Rouen, Dieppe, Havre-de-Grace, Harfleur, Honfleur, Lisieux, Evreux, Yvetot; in the south-western and hilly

part (*Lower Normandy*), the principal towns are Caen, Falaise, St-Lo, Bayeux, Coutances, Avranches, Balonne, Alençon, Cherbourg, and Mont-St-Michel.

In the time of the Romans, the country bore the name of *Gallia Lugdunensis II.* Under the Frankish monarchs it formed a part of Neustria, and was first called Normandy after Charles the simple, in 912, had given it to Rolf or Rollo, the leader of a band of Norse rovers (see NORMANS), to be held by him and his posterity as a fief of the French crown. From Rolf (baptized into Christianity under the name of Robert) and Gisela, the daughter of Charles, sprung the latter dukes of Normandy, of whom Richard I., grandson of Rolf, vigorously maintained his authority against his liege lords, Louis IV. and Lothaire. William II., son of Robert II., became duke of Normandy in 1036; and in 1066, established a Norman dynasty on the throne of England (see WILLIAM THE CONQUEROR), thereby politically uniting Normandy with the latter country. In 1077 his eldest son, Robert, wrested Normandy from him, but it was again united to England under Henry I. in 1105. With this monarch, Rolf's male line became extinct. Henry II., the son of Henry I.'s daughter, Matilda, after the death of Stephen of Blois, obtained in 1154 the government of England and Normandy; but in the reign of his son, John Lackland, it was conquered by Philippe Auguste (1203–04). It remained a portion of the French monarchy for more than 200 years; but after the battle of Agincourt (1415) it was reconquered by the English, who held it till 1449, when it was finally wrested from them by Charles VII. See Liquet's *Historie de la Normandie* (1835); Palgrave's *History of Normandy and of England* (1851–64).

NORMANDY, CUSTOMARY LAW OF (Fr. *Coutumier de Normandie*). The ancient provinces of France were governed principally by a system of laws called *Coutumes*, which had originated in local usages, and been in the course of time reduced to writing and formally sanctioned by the sovereign. *Coutume* was distinguished both from *loi*, which originated with the king, and from *us*, or usage not reduced to writing. Of the codes of customary law, one of the oldest and most famous was the *Coutumier de Normandie*. It was divided into the ancient and modern custom. The former was first reduced to a written form, in 1229 under St. Louis; the latter was the ancient *coutumier*, modified and reformed in 1585 by commissioners appointed by Henry III., with the concurrence of the three estates of the nobility, clergy, and people of Normandy. The ancient *coutumier* treats principally of the duties of the judicial officers, the proceedings in the different courts, and the rights and obligations of the kings of France, the dukes of Normandy, the feudal lords, and the people. In the modern *coutumier* are minute regulations regarding the transmission of property by will and inheritance. Each of the 22 vicomtés, into which Normandy was divided, had a different mode of devising real property. The law by which the Channel islands are still governed is based on the customary law of Normandy. The chief judge in Jersey, Guernsey, and Alderney retains the Norman name of bailli or bailiff, and his authority is much the same as that officer possessed under the Norman law. One of the most remarkable remnants of the *coutumier* still subsisting in the Channel islands is the *Clameur de Haro.* Any one who considers that his rights of property are infringed, protests in the presence of two witnesses, and calling out three times "Haro" (said to be a way of invoking duke Rollo, noted for his justice), summons the trespasser to desist. He then applies to the authorities, relating what he has done, and proceeds to the record office, where note is taken of the circumstances; all which ceremonial must be gone through before bringing an action of trespass. The decision is generally referred to *une vue de justice*, and the losing party is subjected to a fine, and liable in costs: he had formerly also to undergo *un regard de château*, or twenty-four hours' imprisonment, for having implored the aid of the prince without cause.

NORMAN-FRENCH. The well-known "oaths of Strasburg" A.D. 842, though by no means showing any pronounced dialects, are indicative of the state of the Romance languages when the Northmen first began their incursions into France. Rollo (Hrolf, whether contracted for Hárulf, Hraudulf, or Hroarulf, that is, high, red, or fierce wolf, is hard to say) received Neustria as a fief in 911. The number of his men was evidently much exaggerated by the monkish chroniclers of the time, and though the Saxons had long possessed settlements there, though there had once been a ruling Frank population, and though the Northmen must, in their usual fashion, have continued a desultory immigration for years, yet the proportion of Teutonic words (except sea-terms) is little larger than in the other Languedoil dialects, and by the third generation, except at Bayenx, only Norman French was in general use. The northern Romance, or langue d'oil, ultimately counts five dialects, Walloon, Picard, Normand, Frankés, Bourgoin. The fifth of these is the parent of modern French, yet, until the Italian campaigns of Francis I., there is, from the modern point of view, no French language. Each man writes his own patois, and it follows, from varying influences and successive dynasties, that French, the ultimate survivor, will contain a certain admixture of other dialects. It happens that many of the Normand peculiarities have appeared in modern French, and this it is which gives a certain color to those works which institute comparison between English and modern French, a process applicable to a certain number of technical and scientific words which, in truth, are neither French nor English, hardly even Latin. The rule of transformation from Latin to any neo-Latin dialect is, the accented syllable (tonic) is preserved, unaccented syllables (toneless) are dropped or contracted; precession is

applied sparingly, but later generation of secondary mutes takes place throughout. Vowels undergo changes which vary with the dialects. The only apparent exceptions to these rules are formed, not from the Latin, but from a rustic word, usually derivative, and with its accent corresponding to the French. The infliction of Norman-French upon English, little in the 12th c., becomes overbearing in the 13th. From 1220 to 1290 at least one-seventh of the Teutonic words are lost, including the power of compounding. The gaps are filled by French importations. In examining Norman-French from the stand-point of its bearing on English, it is particularly necessary to direct our attention to this century, to the spelling and form of Norman words at that time; the changes in English since are simply these: The Norman accent, already called identical with the Latin, is, in two-syllabled words, on the first, if the word is female (poetically speaking), on the second if male. The English throws back (and the process was evidently only half finished in the time of Shakespeare) this accent to the first syllable, and it is this retrocession which makes it difficult to distinguish between a modern and hybrid word from the French, and an old though wrongly accented word from the Norman. We have, besides, applied a cumbrous and arbitrary system to indicate secondary mutes, notably *g* and *j*, and have, under the influence of the pedants of the 17th c., restored many letters, dropped or contracted in passing from Latin to Norman. These are the rules of change from Latin to old French, most examples being either Normand or Frankés (Ile de France); the particular distinctions for Norman will follow:

I. Toneless Syllables after the Accent.

a. Paroxytons:—disappear—frúctus—fruict; dámnum—dam; —or change to mute e: rosa—rose; granum—graine—grain. *b.* Proparoxytons:—contract—ángulus—ang'lus —angle. Both syllables become *e* mute; dómina—dom'ne—dame; or disappear entircly; dóminus—dom—Eng. dan. (Blasphémus, in lingua Rustica bláspelmus, blasme, Eng. blame. Encáustum, pronounced like Greek égkauston, enque—Eng. ink, Fr. encre.) *c.* Formative terminations, two-syllabled and toneless: *ĭcus—ĭca—ĭcum; i* drops, *c* precessed—fábrica—farge and forge; gránica—granche, grange; *áticus*, contracted first into atge—missáticus—message; *ĭcus—ĭca—icum=e* mute—públicus—pople, not publíc; scholásticus—escolastre, scollard. Termination wholly dropped: láicus—laic or lay (bárica, Fr. Gr. báris, barge, modern barque; phantásticus, fantasche, mod. fantasque). There arc a few exceptions, liturgical words or technical: *īcus, i* long = *ic* or *i; īca* = *ic—amīcus*, amic, ami; *ĭcem—i* drops, *c* is softened or precessed—panticem, pance, paunch; *īcem—i* long = *is, isse, iche*—cornícem, corniche; *ĭdus, ĭdis, ĭda. i* drops, *d* final should be *t*—vápidus, fade; víridis, vert. Without final *d*—pállidus, palle, pale; *ĭlis, ĭlos, ĭla.* Contraction—áquila, aigle, cagle; útilis, utle, not utíle; *īlis* = *il*—avrílis, April; gentílis, gentil, genteel; *ŭlus, ŭla, ŭlum.* Dropping of *u*, and contraction—tabula, table, etc. Vocalization of the consonant: bájulus, bail; mácula, mail; *áculus, ículus, úculus*—trabáculum, travail, travel. Change of *l* to *r:* Reflex action of *u* in the penult; régula, ricule, rule; *ŏlus, ŏ* drops, *tl* = *tr* in French, but remains in English—apóstolus, apostle, Fr. apôtre; *ĭmus, ĭ* drops, final *e* mute—décimus, disme, dime; *ĭnus, ĭnem.* As before, and *u* drops—ásinus, asne, Eng. ass; *n* changes to *m*—consuetúdinem, coustume; *n* changes to *r*—cóphinus, coffre; *n* drops—imáginem, image; *ĕrem*, etc., *ŏrem, ŭra*—cucúmerem, cucumbre, Fr. concombre; *ĭtem*, etc.; *i* drops—cucúrbita, goourds, gourd. Without *e* mute: paepósitus, prevost. (Spíritus, made in Norman cspri, though in Fr. esprit, which is contrary to rule. The English word is later.) *ĕus, ĭos* (a. um.). The short vowel becomes *j*, or *ch*—calúmnia, calonge, challenge. The vowel becomes liquid in Fr., but not in Eng.: fóliuum, foil, Fr. fcuille. Reflex action of the vowel when dropped: ingénium, engein, engine. Vowel disappears: fácies, face, etc.

Note an exception: A low-Latin termination, *ĭa*, which, especially in Languedoc, serves as a derivative, and is applied to a bastard Latin form, itself derived from a neo-Latin word. Such are: compaing, compagnie, company; jalos, jalousie, jealousy, etc. Strengthened by *r*, it applies even to words derived from the Teutonic, viz., fladdha, old Eng. to flyte, flatter, to flattcr. And from this *ie* came our true English geographical forms in *y*, Italy, Araby, etc. *Verbs in ĕre.*—When the *ĕ* drops they become verbs of the French conjugation in *re;* so they were, but after the invention of the third in *oir* they were, owing to a too close juxtaposition of consonants, changed to others. Thus, empreindre, to imprint, is in mod. Fr. émprimer. But as most Norman verbs are changed to English by the summary process of chopping off their tails, little shows of the old forms in our language. But some mistaken transformations of *ēre* can still be discerned: morēre, muevre, to move; placēre, plaiser, to please.

II.—Toneless Syllables before the Accent.

a. Immediately before, they persist: coróna, couronue, legális, léal, loyal. Exception: thériaca, triacle, treacle. When a consonant drops, and two vowels touch, they are contracted: aetáticum, eagc, age, or fused: magíster, maëstre, master; but if the syllable begins with a vowel, it is often dropped: arúnculus, oncle; but if not initial, the short vowel immediately before the tone vowcl drops: bonitátem, bonté, bounty. If the vowel is long it generally persists: labōráre, labourcr, labor. *b.* Unaccented syllables not immediately preceding the tone: dominicélla, doncele, donzel.

III.—Latin Vowels.

If toneless, they are treated without method in spelling; but if accented, *a* continues, sáccus, sack; even if a toneless vowel has dropped: at(i)cus, ab(i)lis = age, able, etc., grace, grátia. The vowels of the Norman, whether influenced or not by the nasality and burr of the Norsk, show a constant tendency to too great broadness and too great fineness, as compared with a standard approaching the Latin, and this standard is best furnished by modern English spelling, when that remarkable system has been left to itself. The Norman changes will be recognized on sight as characteristic of old, notably from Chaucer to Heywood, English, or of provincialisms still current, even in America. Norman *a* is Danish *á*, Gothic *au*, English *aw:* graud, sometimes spelled graunt; but when followed by gutturals or nasals, French turns *a* to *ai:* pácem, pais. This *ai* is in Norman a diphthong, often represented by *ae;* and the Irish pronunciation of English peace is of course only English of Spenser's time, and rightly descends from it; *ai* in mountain is rightly placed in French to Montaigne's time, and marks the vowel as short. Norman varies between *al* = *al*, as in poiterui, or *al* = *aul*, *l* becoming silent, which is modern French, but the *a* is always very long. Phantasma, fantôme, Eng. phantom (!), is a true Norman broad *a;* but we say tax, while the French is still taux. Most short vowels are liquified in Norman, just as in Icelandic; thus short *a* in căput, chapt, chief, and even long, grávis, graef, grief. These are, as compared with Norman or French, so few in English that it would seem a late introduction with us. *E* is in French raised in pronunciation, but in English persists: féstum, feste, feast; *el* final is often replaced by *ian*, mod. *ean;* *e* before a dental fluctuated between *ei*, pronounced as *ai* in straight, and *oi*, pronounced in Norman like *oy* in boy. This struggle continues in modern French, but there is little trace of it in English: peusum, pois, Nor. and Eng. peiz (averdupeiz is etymologically correct); heres, hoir, Nor. and Eng. heir; but monéta, monoie, old Fr. and Nor.; monnaie, mod. Fr. = Eng. money. *Ē* = *i* in verbs of modern conjugation: poenitēre, repentir, repent; and in English varies in racémus, raisin. Exceptions: sébum, soef, suet. *Ĕ* is liquidized: relevo, reliève, relief; but not in tenerum, tendre, tender. *E* tonic is liquidized: sédia, siege, sied, seat, and equals *ī:* prétium, prix, price. *I* usually becomes *e*—crista, creste, crest; but remains before nasals—simplicem, simple, dignor, daigner, deign:—*isc* becomes *ois*—turchisca, turquois, turquoise: *ī* keeps in—ficus, fique, fig. *ĭ* becomes *oi*, = Eng. *ĕ* or *ĭ*—picem, poix, peix, pitch, plico, plier, ploier, ply: *ī* or *ĭ* in certain cases—invidia, envie, envy. *O* generally persists: costa, coste, corselet, coast, cutlet; but cognitus, cointe, quaint. Variations from *ol* to *ou*, but pronounced long: follis, fol, fool; in other positions, persōna, personu, person, becomes *eu* and *ou*, in English more open or more closed: florem, flour, flower, fleur, ferocem, farouche, feërs, fierce, domitare, domter, daunt.

In Fr. an *i* has a reflex action on *o;* not so in English. This and other indications point to the final *e* being sounded until about 1100: gloria, gloïre, glory, ostrea, oistre, oyster, puitre, solium, seuil, sill. *U* changes to *ou* in French, and in English remains *u:* crusta, crouste, crust; changes to *o* in French, in English remains: columna, colomne, column; changes to *oi*, both French and English: punctum, point; but truncus, tronc, trunk; and *oi* to *ui*, but not always in English: fructus, froict, fruit; *u* long, Latin, is sometimes long, sometimes short in English, but in Norman was always long: cupa, coupe, cup; *u* short varies: cupreum, coipre, copper; and though influenced by the reflex of an *i* in French, in English varies: angustia, angois, anguish. *Y.* The latin *y*, a Greek letter, was reproduced in Norman and in English, but is *i* in French: lyra, lyre, Fr. lire; muxa, mesche, match. *Æ.* Treated as an *e* long, and even as an *e* short: quæstum, queste, quest. *Œ.* Same treatment: pœna, poine, pine, pain. *AU.* Already interchanged in late Latin with *ō*. English, Norman, modern French, all vary in treatment: Lat. frauda, thesaurus, nausea; Nor. frode, thésore, noise; Fr. fraude, trésor; Eng. fraud, treasure, noise. *EU.* No Latin words in the Norman, but the Celtic: leuga, line, lieue, league. *UI.* Diphthong rare in Latin. The two vowels occur in circuitus, circuit.

IV.—Vowels and Diphthongs Unaccented.

The cases of anomalous change in toned vowels shown in the exceptions just stated are usually the same as those of the toneless sound corresponding. A few cases of persistence or change may be shown more at length: *A.* Remains in place: carnalis, charnal, charnel. *E*, mercédem, merci, mercy. *I*, imáginem, imaige image. *O*, obscúrus, obscur, obscure. *U*, humánus, humain, human. Where French takes *e*, English often keeps *A*, canális, chenal, canal; *E*, fenúculum, fenoil, fennel; *I*, minútus, menu, mean, fidéles, féal, feal(ty), fiau; *O*, commendo, quemande, command; *U*, succúrere, secourre, succor. Other changes will be found in exceptions, and can be expected from the character of the Norman vowels already described. It is singular that Norsk and Norman, being unusually nasal, English, especially old, is not, misspelling by preference any open vowel followed by *m* or *n*.

V.—Hiatus and Semi-Consonants.

Hiatus is produced much more frequently in Norman than in French, final *e* being preserved before a vowel, *s* in the nominative retained, and probably, under form of *s*, *x*, *z*, pronounced. Vowels not *i* and *e* before an open vowel (they are always liquid) are

separated in pronunciation. Both rules are Norse. *Ge, gi, de, di,* before vowels are certainly not *j* before 1200, and *zh* even later. *Ci, ki, qui, ce, ke, que,* before vowels are not Picardized into *ch* and *sh* till the same time. *Te* and *ti* may have equaled *se* and *si,* but certainly not *sh*. *Hi* is of not the slightest consequence—as often absent as present. *Ch* of early Norman simply equals *k*. On the whole, English is likely to keep a Latin letter and avoid hiatus, where Norman would drop it.

VI.—Consonants.

Taken as initial, medial, or final, of course after disappearance of the Latin covering syllable. Modern French dislikes double consonants, unless one be liquid or nasal; Norman and English show such feeling in some instances: captivus, chaitif, captive; but judicare, juger, judge. Also, true of these consonants when the last drops: blasphemare, blâmer, blame. Changes of consonants are: precession, assimilation, transposition, and all are much less common in Norman, and therefore in English, than in modern French. *D* gutturals *c* and the *ch* it replaces.

Initial.

Chorus, queir, quire (= *k*); but capelletam, goubelet, goblet; calx, chaulx, chalk, (= *ch*); capulum, chable, cable; cedere, ceder, cede (= *s*); chirurgianus, siurgien, surgeon.

Medial.

Pertica, perche, perch; but laxus, lasche, lax; pacare, payer, pay—disappears; ducatus, duché, duchy, various; licére, loysir, leasure; jocus, jocs, joke.

In combination.

Cc, accentus, accent; *ct,* fluctuare, floter, float; placitum, plait, plea; factionem, façon, fashion; *cs* or *x,* extraneus, estrainge, strange; exilium, eissil, exile; *x,* taxa, tasche, task (= *sk*); but fixare, ficher, fix; *cm,* Jacomus, Jaimes, James, etc. *Qv* has persisted in English, though less in French; but aquila, aigle, eagle. *G,* initial and medial, or final: gobinem, gougeon, gudgeon (= *g*); but gagátes, jayet, jet; angelus, angiel, angel (= *j*); flagellum, flael, flail, disappears.

In combination.

Gva, gve, languere, languir, languish; *gr, gl,* peregrinus, pélérin, pilgrim; but integrum, entier, entire; *ugr, ugl,* plaugere, plaindre, plain; *gn,* pugnare, pogner, punch; amygdala, amandle, almond. *J,* Latin, a real *g* is now in French *zh,* but English *j:* projectus, progeict, project; raja, raie, ray. *H* invariable in Norman, only in Teutonic words: hairon, heron; hair, hate. English has from it two words which do not deserve the *h;* the French is entirely arbitrary: eremita, hermit; upupa, hoopoe. *P* almost intact, but cupitare, couvoiter, covet, pulpitulum, poulpitre, pulpit; but caput, chief.

In combination.

Ps, psalmus, saulme, psalm (pedantic); *pl,* duplex, double; *pr,* aprilis, avril, april; *ps,* capsa, chasse, caisse, case; *pt, pd,* ruptus, raout, rout, and examples already given; *pi, pe,* pipionem, pichon, pigeon; *pp,* mappa, nappe, nap(ery). *B* almost always persists: but taberna, taverne, tavern; subundare, soonder, sound, etc.; *br,* brevis, brief; febris, fièbre, fever; *bl,* fabula, fable; debilis, deueil, dule; *bt,* subitanus, soudein, sudden; *bs,* absolvere, assouldre, assoil; *bi, bm, bv,* subvenire, souvenir. *F. ph,* which was always replaced by *f,* generally persists, yet bifax, viais, bias. *V.* initial low Latin *v* represents *v, w, gu,* even *qu* of the Teutonic languages, and most of these words in English in which *g* represents Norman *gu* have another form in *w,* the true one: vadium, gaige, gage = wage; guarder, guard = ward; guigue, jig = gig(gle), Danish, and the word never has come into English; elsewhere *v* persists: novellus, novel, estridge; but avisstruthio, austruche, ostrich; salvus, saulf, safe. *M* persists, but comestabulus, connestable, constable; stramen, estrain, strain; *mr, ml,* camera, chambre, chamber; marmor, marbre, marble; *mu,* adluminare, alluminer, allume; *mt, md, mc, mi, mg,* in all *m* changes to *u:* comitem, counte, count; cambiare, changier, change; *mb, mp,* gamba, geambe, gam(mon). *T, th,* which is replaced by *t,* disappears: potere, pooir, power; but many old words keep *t* between two vowels: materies, matière, matter. And the Languedoc words: metallea, médaille, medal; intybum, endive, change t to d; bombitare, boundir, bound; *st,* culcitinum, coulsin, cusheon; *tc,* silvaticus, saulvage, savage; *tm, tn,* platanus, plane, plane; *tr,* latrocinium, lareçin, larcen(y); *tl,* voltulare, vaultrer, vault. *T* final, saved though mute in many French words, is even more preserved in Norman, always when originally preceded by a consonant. In past participles it keeps *ct,* and the old *t* final, which is now *ct*. *T* before toneless *i* or *e* and a vowel is always soft in French, but Norman had preserved the spelling, though hardly the pronunciation: potionem, poison. *D* initial persists; medial is lost: predicare, preecher, preach; *d* between two vowels is almost never Norman, yet estude, rude, odeur; *d* final, drops: gradus, grée, degree; *d* and another consonant, *d* drops, but not always in English. *D* intrudes in tenerum, tendre, tender; *ds* assimilates: adsecurare, assurer, assure. *S* almost unchangeable: but sicera, cidre, cider; designare, desseiner, design. In combination *s* usually drops, but not as much as in modern French: *sc,* vascellum, vaissel, vessel; *sp,* despectus, despeit, despite; *su,* asinus, asne, asse; *sl,* vassaletus,

vaslet, valet (Danish.) *Sr* or *cr*, insert *t*, antecessor, ancestre, ancestor. *Dis, ex*, in French *dé* and *é* are preserved in Norman, as well as *st*; in modern French *e*, with *sp* initial, makes *ê*. English makes *sc, sp, st*, initial; late Norman makes *esc* or *esch, esp* and *est;* the inference is evident.

Latin.	English.	Late Norman.	French.
scala,	scale,	eschiel,	échelle.
sparsus,	spare,	espars,	êpars.
strictus,	straight,	estreict,	êtroit.

Not all of these words are technical, and borrowed by Saxon before 1000 A.D., and though it is an exception to Romance rule, it seems likely that Norman was more like English than French in this up to 1150. Other changes are: staunum, estein, tain, tin; stationem, saison, season. *Z* Latin, in verbal terminations, should always be *s:* baptizare, baptiser, baptize. Before mentioned: zelosus, jaloux, jealous. *N*, initial, medial, and final remains: sanus, sain, sane ; but quaternum, quahier, quire; and diurnum, jour, jour(nal). Latin, udinem: consuetudinem, coustume, custum; couchylium, coquille, cockle. Other cases mentioned already. *N* before short *e* or *i:* seniorem, seignieur, seignior. *N* inserted: laterna, lantern; reddere, rendre, render; but joculari, jongler, juggle. The groups *ndr* for *nr*, and *ngl* for *gl*, are decidedly Norsk ; so is *mbl* for *ml*. *L* generally rests initial, medial, or final: filius, filz, fitz; vocalis, voielle, vowel. Note, digitalis, deel; détale, ditany. *L* in combination: followed by *ly* consonant, *l* = *u* in French, but not in Norman and English: Note, marla (for marg'la), marne, marl; scandalum, scandale, scandal; esclandre, slander. *R* remains, except changing with *s* seldom, and *l* sometimes; remains in English: kaemmer-leik-ing, chamberlenc, chamberlain. Often transposes: fimbria, freinge, fringe. The proportion of Norman words in English, and the history of the connection between the two languages, may be found in so many treatises that no attempt has here been made to do more than carefully indicate the true derivation and spelling of Norman words in English. The grammar and the literature of the language belong to the study of French dialects; and as written by even the second generation after the conquest, always excepting Richard cœur de lion and a few troubadours, the English productions in the tongue are so bald and corrupt as scarcely to repay translation into the pure dialect of their time. They never had a possessive nor any serviceable particles; they forgot the two cases of the noun and the double formation of object and subject; they neglected the subjunctive of their verbs, and forged abstracts by hitching a termination to the first word they happened to remember.

NORMANS (i.e., Northmen), a name generally limited in its application to those sea rovers who established themselves in that part of France called after them, Normandy; but sometimes embracing also the early inhabitants of Norway. During the middle ages, the name Northmen, or Norsemen, was often used in a broader sense, to denote the entire population of Scandinavia, and still more frequently, perhaps, to designate the Danes and Norwegians, exclusive of the Swedes, The Germans and French called the piratical hordes who ravaged their shores Normans or Northmen; the Saxons, usually Danes or Eastmen. They were also distinguished by the latter as *Mark-* or March-men (from Den-*mark*), as *Ash*-men (i. e. men of the *ashen*-ships), and as the *Heathen*. The primary cause of the plundering expeditions southward and westward across the seas, undertaken by the Norse Vikings (*Vikingar*, meaning dwellers on the *vics*, i. e., bays or fiords), as they called themselves, under leaders, who took the name of "Sea-Kings," was doubtless the over-population and consequent scarcity of food in their native homes; besides, the relish for a life of warlike adventure, conjoined with the hope of rich booty, strongly attracted them; while—at least as long as the old Scandinavian religion lasted (i.e., till about the end of the 10th c.)—death in battle was not a thing to be dreaded, for the slain hero passed into a region of eternal strife in the Walhalla of Odin. Finally, discontent with the ever-increasing power of the greater chiefs or kings, induced many of the nobles with their followers to seek new homes.

The first Danish Norsemen made their appearance on the eastern and southern coasts of England in 787. After 832, their invasions were repeated almost every year. To one of these belongs the *legend* of Ragnar Lodbrok (i.e., Ragnar of the "Shaggy Brogues"), who is said to have been taken prisoner by Ella, king of Northumbria, and thrown into a dungeon filled with vipers, where, while expiring amid horrible torments, he sung with heroic exultation the story of his life. The very existence, however, of such a person as Ragnar Lodbrok is questioned by many Scandinavian scholars, In 851, the Norsemen wintered for the first time in the island, and after 866 obtained firm footing there. The Anglo-Saxon Ethelred I. fell in battle against them in 871. His brother Alfred, known as Alfred the Great (q.v.), after a long and doubtful struggle, partially reduced them to subjection; nevertheless, he was compelled to leave them in possession of Northumbria and East Anglia; and had not only to defend himself against a new and fierce invasion led by the famous rover Hastings (q.v.), but like his immediate successors, to contend against the revolts of his Dano-Norman subjects. A period of external peace now ensued; but in 991 the invasions of the Danes and Norwegians began anew. The Saxon king, Ethelred II., at first sought to buy them off by paying a sort of tribute-money, called *Danegelt* (q.v.); but the massacre of the Danes living in England, by com-

mand of that monarch, Nov. 13, 1002, was avenged by four expeditions under the Danish king, Swen, who frightfully wasted the country, and finally conquered it in 1013, dying the following year. His son Knut, or Canute (q.v.), after carrying on a struggle for the supreme power with Ethelred and his successor Edmund Ironside (q.v.), at length, on the death of the latter, became sole monarch of England, which now remained under Danish or Norse rulers till 1042. The government of the country then reverted into the Saxon hands of Edward the Confessor (q.v.), who was succeeded in 1066 by Harold II. (q.v.), son of the powerful Goodwin, earl of Wessex (q.v.); but in October of the same year, Harold lost his life and crown at the battle of Hastings, and William the Conqueror, a descendant of a Norwegian chief who had settled in Normandy, once more established a Norse dynasty on the throne of England, but one greatly refined and improved by long residence in a comparatively civilized region.

It was also Danish Norseman, in particular, who ravaged the western coasts of European mainland, from the Elbe to the Garonne. As early as 810, the Danish king, Gottfried, had overrun Friesland; but the power of the great Charlemagne was too much for these undisciplined barbarians, and they were overawed and subdued for a time. Soon after his death, however, they recommenced (*circa* 820) their piratical expeditions, and favored by the weaknesses and dissensions of the Carlovingian rulers, became, during the 9th c., the terror and scourge of north-western Germany and France. They plundered Hamburg several times, ravaged the coasts of the Frisians (which then extended as far as the Scheldt), and in 843 firmly planted themselves at the mouth of the Loire. But ere long they ceased to be satisfied with making descents and settlements on the coasts, and in their small piratical craft they swarmed up the great rivers into the interior of the country, which they devastated far and wide. Thus in 845, they ascended the Seine and plundered Paris—an exploit which was frequently repeated. In 885, not less than 40,000 of these Vikings are said to have ascended the river from Rouen, under the leadership of one Siegfried in 700 vessels, and besieged the capital for ten months. It was only saved at the expense of Burgundy, which was abandoned to their ravages. In 881, Louis or Ludwig III., king of the West Franks, inflicted a severe defeat on the invaders at Vineu, near Abbeville in Picardy, the memory of which has been preserved in a song still popular among the country people; but neither that, nor the repulse which they sustained from the brave German monarch Arnulf, near Louvain in 891, could hinder them from making fresh irruptions. In 892, they appeared before Bonn, and tradition says that bands of Danish rovers penetrated even into Switzerland, and established themselves in the canton of Schweiz and the vale of Hasli. From their settlements in Aquitania they proceeded at an early period to Spain, plundered the coasts of Galicia in 844, and subsequently landed in Andalusia, but were defeated near Seville by the Moorish prince Abd-ur-Rahman. During 859–60, they forced their way into the Mediterranean, wasted the shores of Spain, Africa, and the Balearic Isles, penetrated up the Rhone as far as Valence; then turning their piratical prows in the direction of Italy, entered the Tyrrhene sea, burned Pisa and Lucca, and actually touched the distant isles of Greece before their passion for destruction was satiated, or before they dreamed of returning west.

Doubtless Norwegian rovers also took part in these so-called Danish expeditions. We know that as early as the beginning of the 9th c. they made voyages to the n. of Ireland, Scotland, the Hebrides, the Orkney and Shetland isles; and the increasing power of Harald Haarfager in the 9th and 10th centuries, exciting great discontent among the smaller chiefs, great emigrations took place, and these islands became the new homes of these Norwegian Vikings. About the same period, colonies were settled in the Faröe Isles and Iceland, from which some Vikings proceeded westward across the North Atlantic to Greenland in 982, and thence in 1002, south to a region which they called *Vinland*, now universally believed to be the coast of New England, thus anticipating the discovery of America by Columbus by nearly 500 years. From Norway also issued the last and most important expedition against the coast of France. It was led by Rolf or Rollo, who had been banished by Harald Haarfager on account of his piracies. Rolf forced Charles the simple to grant him possession of all the land in the valley of the Seine, from the Epte and Eure to the sea. By the time of Charles the bald the invaders had firmly planted themselves in the country, which then went by the name of Normandy (q.v.). They and their descendants are strictly speaking, the Normans of history—warlike, vigorous, and a most brilliant race. They rapidly adopted the more civilized form of life that prevailed in the Frankish kingdom—its religion, language, and manners, but inspired everything they borrowed with their own splendid vitality. At a later period (the 12th c.), they even developed a great school of narrative poetry, whose cultivators, the *Trouveurs*, or *Trouvères*, rivaled in celebrity the lyrical troubadours of southern France. Their conquest of England, in 1066, gave that country an energetic race of kings and nobles, on the whole well fit to rule a brave, sturdy, but somewhat torpid people like the Anglo-Saxons. But though the Normans had acquired comparatively settled habits in France, the old passion for adventure was still strong in their blood; and in the course of the 11th c., many nobles with their followers betook themselves to southern Italy, where the strifes of the native princes, Greeks and Arabs, opened up a fine prospect for ambitious designs. In 1059, Robert Guiscard, one of the ten sons of the Norman count, Tancred de Hauteville, all of whom had gone thither

was recognized by pope Nicholas II. as duke of Apulia and Calabria, and in 1071 as lord of all lower Italy. His brother and liegeman, Roger, conquered Sicily, 1060–89. Roger II. of Sicily united the two dominions in 1127; but in the person of his grandson, William II., the Norman dynasty became extinct, and the kingdom passed into the hands of the Hohenstauffen family.

The Swedish Norsemen directed their expeditions chiefly against the eastern coasts of the Baltic—Courland, Esthonia, and Finnland, where they made their appearance in the 9th c.—the very time when their Danish and Norwegian brethren were roving over the North sea, the English channel, the bay of Biscay, and were establishing themselves on the shores of England and France. According to the narrative of the Russian annalist, Nestor, they appear to have penetrated into the interior as far as Novgorod, whence they were quickly banished by the native Slavic and Finnish inhabitants, but were as quickly solicited to return and assume the reins of government. Hither, consequently, in 862, accompanied by other noted warriors, came three Swedish chiefs, Rurik, Sineus, and Truwor, sons of the same father, and belonging to the tribe of *Ros* (whence *Russ* and *Russians*). Rurik founded one kingdom at Novgorod, which stretched northward as far as the White sea. His successor, Oleg, united with that a second established by other Swedish adventurers at Kiev, which town now became the capital of the wide-extended Russo-Swedish kingdom. See Russia. For a long period these Norsemen, who, it appears, became completely identified with their Slavic-speaking subjects in the 10th c., were dangerous enemies of the Byzantine empire, whose coasts they reached by way of the Black sea, and whose capital, Constantinople, they frequently menaced, as, for instance, in 941, when Igor is said to have appeared before the city with upwards of 1000 ships or boats. Earlier in the same century, these Swedo-Russian warriors had found their way into the Caspian sea, and actually penetrated to the coasts of Tartary and Persia. Partly from them, and partly from native Scandinavians, came those soldiers who from the 9th to the 12th c. formed the body-guard of the Byzantine emperors.—See Deppings's *Histoire des Expéditions Maritimes des Normands et de leur Etablissement en France au* 10^{me} *Siècle* (2 vols. 2d edit. 1843); Wheaton's *History of the Northmen from the Earliest Times to the Conquest of England* (1831); Worsaae's *Minder om de Danske og Normändene i England, Skotland, og Irland* (1851); Freeman's *History of the Norman Conquest* (1867–76).

NORNÆ, the *Parcæ* of the northern mythology. They were three young women, by name Urd, Verdandi, and Skuld—i.e., past, present, and future. They sit by the Urdar-well under the world-tree Yggdrasil, and there determine the fate both of gods and men. Every day they draw water from the spring, and with it and the clay that lies around the wells, sprinkle the ash-tree Yggdrasil, that its branches may not rot and wither away. Besides these three great norns, there are also many inferior ones, both good and bad; for, says the prose Edda, when a man is born there is a norn to determine his fate; and the same authority tells us that the unequal destinies of men in the world are attributable to the different dispositions of the norns. These lesser norns corresponded to the *genii* of classic mythology. Women who possessed the power of prediction or magic also bore this name.

NORRBOTTEN, the extreme n. province of Sweden, adjoining Russia and the gulf of Bothnia, separated from Lapland by the Torneo and Muonio rivers, drained by the Lulea, Pitea, and Kalix rivers; 36,797 sq.m.; pop. 86,655. It contains many lakes and rivers. The summers are hot, but the climate not unhealthy. The principal articles of export are ore and timber. Capital, Pitea.

NORRISTOWN, a borough of Pennsylvania, on the n. bank of the river Schuylkill, 16 m. n.w. of Philadelphia, containing cotton and woolen factories, iron rolling-mills and foundries, machine-shops, court-house, jail, public library, bank, 13 churches, seminary, 5 public schools, 1 German and 7 English newspapers, and in 1870, 10,753 inhabitants.

NORRISTOWN (*ante*), co. seat of Montgomery co., Penn., on the Philadelphia, Germantown, and Norristown, and Stony Creek railroads; pop. '80, 13,064. It is on high land, and regularly laid out. The principal materials used in its buildings are the marble and stone which are quarried in the neighborhood. It has a fine marble court-house, a jail, a lunatic asylum, a number of churches, a music hall, a public library, 3 banks, 2 large boarding schools, and 7 periodicals, of which, 2 are dailies, and 1 is printed in German. There are machine works, blast furnaces, rolling, cotton, and woolen mills, oil refineries, etc. Two bridges, about 800 ft. long, span the Schuylkill to Bridgeport, the e. terminus of the Chester Valley railroad.

NORRKÖPING, the first manufacturing t. of Sweden after Stockholm, is the chief t. of Linköping-Län, in east Gottland, and is situated at the junction of the Motala with the gulf of Bravike, in 58° 30′ n. lat., and 16° 15′ e. longitude. Pop. in '81, 26,735. It is a fine, well-built town, with broad streets, large squares, and numerous churches and charitable institutions. The rapid river Motala, which is spanned by several substantial bridges and lined with commodious wharfs, affords very considerable water-power, by which numerous systems of machinery are worked. The manufactures are cloths, stockings, starch, tobacco, soap, etc., while in the neighborhood are the extensive ironworks

and cannon foundries of Finspäng. Norrköping is a good salmon station, and is the principal Swedish port for the importation of wines and foreign spirits.

NORSEMEN, or NORTHMEN. See NORMANS, *ante.*

NORSE MYTHOLOGY. See ÆSIR: SCANDINAVIAN MYTHOLOGY.

NORTH, CHRISTOPHER (*pseud.*). See WILSON, JOHN, *ante.*

NORTH, EDWARD, L.H.D., b. Conn., 1820; educated at Hamilton college, and since his graduation in 1841 has been one of the most active members of the faculty. In 1843 he was made professor of ancient languages, and since 1863 has occupied the Greek professorship. For 30 years prof. North has been chairman of the Hamilton alumni association, and has edited the triennial catalogue and also a biographical catalogue. He has contributed articles to the *North American Review* and several educational journals, and has delivered lectures on literary topics. The degree of L.H.D. (doctor of literature) was conferred upon him in 1862 by the university of the state of New York.

NORTH, FRANCIS, Lord Guilford, 1637–85; second son of sir Dudley North, the fourth baron of the line; educated at St. John's college, Cambridge, and after 2 years study there became a member of the middle temple. He was called to the bar in 1661. He had always been a student of great application, and upon entering into practice he used every means (not always dignified or honorable), to advance himself and obtain the favor of the great. He was made solicitor-general in 1671, attorney-general in 1673, lord chief-justice of the common pleas in 1675, and in 1682 was made lord-keeper of the great seal. The memoirs of the lord-keeper by his brother, Roger North, represent him as selfish, cowardly, trimming in politics, and capable of descending to baseness to increase his own power. He was a strong upholder of the prerogative, and only at the last moment warned James II., of the ruin to which that monarch's infatuation was hastening him. As a lawyer, his ability and learning were undoubted, and his decisions did much to increase the extent of the jurisdiction of the courts of common pleas. Lord Campbell characterizes his professional qualities by saying, "He had as much law as he could contain, but he was incapable of taking an enlarged and commanding view of any subject."

NORTH, FREDERIC, Lord, English minister, was b. April 13, 1732, and educated at Eton, and Trinity college, Oxford. His father, baron Guilford, a descendant of Roger, baron North (*temp.* Henry VIII.), was created an earl in 1752. North entered the house of commons at an early age, was made a lord of the Treasury in 1763, and inherited the tory politics which, in the days of Charles II., had placed his ancestor in the highest ranks of the law and the state. It was his boast in the house of commons, that "since he had had a seat there he had voted against all popular, and in favor of all unpopular measures." On the death of Charles Townshend, in 1769, he was made chancellor of the exchequer and leader of the house of commons, a post for which he was well qualified by his eloquence, good humor, wit, and readiness of resource. His folly was, however, one of the immediate causes of the American war. Earl Russell, in his *Life and Times of C. J. Fox*, says that "for £100,000 a year of revenue George Grenville provoked America, and that for £16,000 a year of revenue lord North lost America." In 1770, he succeeded the duke of Grafton as prime-minister. As a minister he was too ready to surrender his own judgment to that of George III., who, with a narrower understanding, had a stronger will, and was determined to subdue America. North was called by Horace Walpole the ostensible minister; the real minister was the king. North had to encounter an ardent and powerful opposition, led by C. J. Fox and supported by Burke. It has since been proved that North "so early as 1776 was of opinion that the system he was pursuing would end in ruin to the king and to the country." In 1778, he renounced the right of taxing the colonies. In 1782, it being impossible to carry on the war with America any longer, North resigned. "A more amiable man never lived," says earl Russell; "a worse minister never since the revolution governed this country." With North's retirement came to an end George III.'s scheme of governing the country by his own will, and ruling the house of commons by court favor and thinly disguised corruption. North was succeeded by the marquis of Rockingham, on whose death lord Shelburne became premier. Fox's dislike of the terms of peace with America led him to enter into a coalition with North, whom he had for so many years inveighed against as a minister without foresight, treacherous, vacillating, and incapable. North and Fox took office under the duke of Portland in 1783, but the coalition destroyed Fox's popularity, and the Portland administration only lasted a few months. North was afflicted by blindness during the last five years of his life. He succeeded to the earldom of Guilford, in 1790, on the death of his father, and died in Aug. 1792.

NORTH, SIMEON, D.D. LL.D., b. Conn., 1802; after graduating at Yale college in 1825, was for 2 years a tutor in that institution. In 1829 he was appointed professor of ancient languages in Hamilton college, New York, and in 1839 was elected president of the college. He has printed several orations and sermons.

NORTH, WILLIAM, 1755–1836; b. at Fort Frederick, Maine, and in 1775 entered the revolutionary army; rose from the ranks, and in 1778 was a capt. and present at the battle of Monmouth. The next year he was appointed aid to baron Steuben, and remained with him until the surrender of Cornwallis. At the death of Steuben half of

his estate was left to gen. North, as he was then by brevet. He continued to serve in the army as inspector and adjt.gen. until 1800; was afterward a prominent federalist, speaker of the N. Y. legislature, and U. S. senator.

NORTH ADAMS, a village in Berkeshire co., Mass., on the Hoosac river; about 35 m. e. of Albany, 20 m. n.e. of Pittsfield; on the Troy and Boston, and the Pittsfield and North Adams railroads; pop. '80, 10,192. There are 2 weekly papers, 3 banks, and 7 churches. There are more than 15 cotton and woolen mills in the township of Adams, and very large manufactories making boots and shoes. The various mills have given the village great prosperity. North Adams is near the entrance of the great Hoosac tunnel about 5 m. in length. The scenery around the town is very fine, Greylock, distant but a few m., being the highest mountain in the state, 3,600 ft. The experiment of employing Chinese in some of the village factories attracted much attention some years ago.

NORTHALLERTON, capital of the North Riding of Yorkshire, a market-t. and parliamentary borough, 250 m. n.n.w. of London, and 30 m. n.n.w. of York by railway. It stands near the left bank of the Wiske. It contains a large number of public schools and other institutions. Manufactures of linen and leather, brick-making, and malting are carried on on a limited scale. Pop. (1881) of parliamentary borough, 5,445, who send a member to the house of commons. The battle of the "Standard," so called from a hugh standard erected on a car by the English, was fought here, Aug. 22, 1138, between the English under the earls of Albemarle and Ferrers, and the Scotch under king David. The latter were defeated, and forced to retreat with great loss.

NORTH AMERICA. See AMERICA, *ante*.

NORTHAMPTON, a co. in n.e. North Carolina, adjoining Virginia, drained by the Roanoke and Meherrin rivers; on the Seaboard and Roanoke, and the Petersburg railroads; 500 sq.m. pop. '80, 20,032. The surface is generally level and the soil fertile. The principal productions are Indian corn, wheat, oats, tobacco, cotton, potatoes, and sweet potatoes. Co. seat, Jackson.

NORTHAMPTON: a tp. in Burlington co., N. J. Pop. '80, 4,630.

NORTHAMPTON, a co. in e. Pennsylvania, adjoining New Jersey; bounded on the e. by Delaware river, on the s.w. by the Lehigh river; crossed in the s. by the Lehigh river, on the Lehigh and Susquehanna, Lehigh Valley, and North Pennsylvania railroads; 400 sq.m.; pop. '80, 70,316—64,021 of American birth. The Kittatinny or Blue mountains run along the n.w., and the South mountain along the south-east. The surface in the center is level, and the soil fertile. The principal products are Indian corn, wheat, rye, buckwheat, hay, potatoes, and wool. There are slate and limestone quarries, and iron and zinc mines. Sandstone is abundant in South mountain. Among the articles manufactured are bricks, lime, carriages, cigars, castings, leather, flour, lumber, furniture, pig iron, and castings. Co. seat, Easton.

NORTHAMPTON, a co. in s.e. Virginia, between the Atlantic ocean and Chesapeake bay, forming the s. part of a narrow peninsula, the extremity of which is cape Charles; 320 sq.m.; pop. '80, 9,152—9,143 of American birth—5,263 colored. The surface is level, and heavily wooded in parts. The soil is sandy, and the principal productions are Indian corn, oats, potatoes, and sweet potatoes. Co. seat, Eastville.

NORTHAMPTON, a village of Massachusetts, 1 m. w. of the Connecticut river, 95 m. w. of Boston, on the Connecticut river railway. It is celebrated for its beautiful scenery, mounts Tom and Holyoke rising from a picturesque valley. It contains many elegant residences, the county buildings, 6 banks, several academies, 11 churches, 1 cotton factory, 2 silk factories, 3 paper-mills. A bridge 1080 ft. long connects it with Hadley. Pop. '70, 10,160.

NORTHAMPTON (*ante*), a t., the co. seat of Hampshire co., Mass., on the Connecticut river, 17 m. n. of Springfield; situated on the New Haven and Northampton, and Connecticut river railroads; pop. '80, 12,172. The town is mostly on rising ground about a m. from the river, is laid out with great taste, well supplied with elms and other old trees, and has long been considered one of the most beautiful places in the country. Water power is furnished by a stream flowing through the town, and there are many mills, the chief manufactures being silk, cotton, and woolen goods, sewing silk, paper, buttons, and cutlery. The public buildings are the county court-house, town-hall, Memorial hall, built in memory of Northampton soldiers who died in the war against rebellion, and public library; there are 6 banks, a high school, many district schools, and 8 churches. Here also are the Smith college for women, the Clarke deaf mute institute and the state lunatic asylum; besides privately endowed institutions for charities and aid. There are several hotels, one at Round hill on a hill near the village, was formerly famous as a water cure institution. There are many pleasant drives in the neighborhood, the whole region of the upper Connecticut valley being noted for its picturesque scenery. The main village is connected by horse cars with Florence, which is included in the township and where are extensive sewing machine factories and silk mills.

NORTHAMPTON, capital of the co. of the same name, a market-t., and parliamentary and municipal borough, on a rising ground on the left bank of the Nen, 67 m. n.w. of London by railway. In the center of the town is a spacious market-square. The

principal edifices are the shire hall, the new and handsome town-hall, the corn exchange, the numerous churches, several of which are unusually interesting, as St. Peter's, a recently restored and beautiful specimen of enriched Norman, and St. Sepulchre's, much improved in 1865, one of the very few round churches in the empire, and referred to the 12th century. The hospitals of St. John and St. Thomas were religious houses prior to the reformation. Boot and shoe making, which affords employment to about 3,000 persons, is the principal branch of trade carried on here. Leather is made, and hosiery and lace are manufactured. Iron and brass foundries are in operation, and brewing is carried on. Two markets are held here weekly, a general one on Wednesday, and one for cattle on Saturday. Pop. (1881) of parliamentary borough, 57,553, who return two members to parliament.

Northampton, a very ancient town, was held by the Danes at the beginning of the 10th c., and was burned by them in 1010. After the conquest, it was bestowed on Simon de St. Liz. Its castle was besieged by the barons in 1215, during the cival wars of king John. It was the scene of a great battle fought (July 10, 1460) during the wars of the Roses, between the rival houses, in which the earls of March and Warwick defeated the Lancastrians.

NORTHAMPTONSHIRE, a central co. of England, bounded on the w. by the counties of Warwick, Leicester, and Rutland, and on the s.w. by Oxfordshire. Area, 629,912 acres; pop. '81, 272,555. Its surface is marked by gently undulating hills, alternating with well-watered vales. The chief rivers are the Nen and the Welland, both of which flow n.e., and fall into the estuary of the Wash. The county is traversed by the London and North-Western, the Great Northern, the Eastern Counties, and other lines of railway, and communication by water is maintained by the Union, Grand Junction, and other canals, as well as by the rivers. The climate of the county is mild and healthy; the soil, a black mold in the fen districts in the n.e., and brown loam on the uplands, is very productive. White and green crops are abundantly produced, and on the rich pastures cattle are extensively reared for the London market. Four members are returned to the house of commons for the county.

NORTH CAROLINA (Carolina, North, *ante*), was first explored by a party of 108 persons sent from England by sir Walter Raleigh in 1584, and the first settlement was made on Roanoke island during that year. Trouble with the Indians, however, caused the colonists eventually to return to England, and no further attempt was made to colonize the region until several years later when people from Virginia succeeded in establishing themselves on the northern border. In 1663 Charles II. made a grant of the province, which included both of the Carolinas, to eight noblemen by whom great efforts were made to induce colonization, and shortly afterwards colonies of French, German, and Swiss Protestants came over. About 1700 the province was divided into North and South Carolina, and separate governments were organized. From this time up to the revolution, North Carolina was ruled by successive governors appointed by the English king. But in Aug., 1776, the colony ratified the Declaration of Independence, and in the following December held a convention at Halifax and framed a constitution for the state, which remained the organic law until 1835. After the revolution the state enjoyed much prosperity, and its history is marked by no particularly eventful period until the breaking out of the rebellion. The popular sentiment in the state at the beginning of 1861 was apparently in favor of the union; but after the surrender of fort Sumter and the declaration of war, an extra session of the legislature was called, and an ordinance of secession passed, April 20. The state thenceforth during the next four years suffered many disasters of war. In Aug., 1861, fort Hatteras and fort Clark were seized by federal forces; Roanoke island and New Berne were next captured by Burnside's expedition; and later the region about Plymouth, Kinston, and Washington was taken and occupied by federal troops. Other important battles fought in the state during the war were at Averysborough, Bentonville, and the taking of fort Fisher. As soon as peace was declared; a provisional governor, W. W. Holden, was appointed, and on Oct. 2, 1865, a convention assembled at Raleigh declared the ordinance of secession null, abolished slavery, and repudiated the state debt created to carry on the war. An election was held soon after, and a governor, legislature, and members of congress chosen. But as the re-organized government refused to ratify the fourteenth amendment to the constitution of the United States, the state was declared to be still under military authority, and was placed under the command of gen. D. E. Sickles. Another convention, therefore, was called, and the delegates met in Raleigh in Feb., 1868, and prepared a constitution that was ratified by the people and which congress approved. Accordingly the state was restored to the union in July, 1868. The state has suffered much in many ways during the past 20 years, its peace having been seriously disturbed for a long while by organized

bands of outlaws known as ku-klux klan and its political and financial affairs having been in a troubled condition.

The mineral resources embrace not only coal and iron of superior quality, but the precious metals. Of the coal deposits there are two fields, one in Stokes and Rockingham counties with an area of 30 sq.m., and another in Chatham and Moore counties with an area of 40 sq.m., of which each square mile is believed to contain 6,000,000 tons of coal of the best quality. The beds have been mined to some extent, principally at Egypt, Farmville, and Homsville. Gold has been found in 23 counties and has been mined to a considerable extent for nearly half a century. The most productive mines are the Gold Hill mines in Rowan co., which were discovered in 1842. Other regular veins have been worked in Davidson, Cabarrus, Stanley, Montgomery, and Mecklenburg counties; and irregular veins and surface gold are also found in the same counties to some extent, and in Catawba, Randolph, Union, and Franklin counties. Between 1793 and 1884 more than $10,000,000 in North Carolina gold was deposited in the U. S. mints. Silver is found in Davidson and Clay counties, but the mines have been little worked. Copper ores of various kinds exist in several parts of the state; also lead, zinc, antimony, and other metals are known to exist, with some small amounts of platinum and palladium. Mica is profitably mined in Mitchell and Yancey counties. Alum, graphite, jade, buhrstone, granite, kaolin, limestone, whetstone, grindstone, soapstone, and corundum are found, the latter in great abundance; and, in fact, the mineral wealth of the state is remarkably great. The agricultural products are chiefly rice, cotton, tobacco, sweet potatoes, wheat, and Indian corn; but the soil, as well as the climate, differs much in different parts of the state. The temperature of the lowlands is hot and humid; but in the interior, particularly in the Piedmont and the mountain section, the air is singularly pure, dry, and elastic. The mean annual temperature at Raleigh is 60°; at Asheville, 50°; at Wilmington, 63°; and the average rainfall is about 45 inches. Along the coast region the swamp lands when drained and the river bottoms are fertile, and rice grows well. Further inland the soil improves and is well adapted to wheat, rye, barley, oats, and flax. Cotton is raised principally in the counties along the southern border. The western and mountainous portions are best adapted to grazing, and in these parts stock raising is the leading pursuit. The forest trees of the uplands are oak, hickory, ash, walnut, and lime; in the lowlands, the long-leaf pine; and in the swamps, cedar, cypress, maple, oak, and poplar. A very large extent of territory, extending from a point near the line of Virginia across the entire state, varying in width from 30 to 80 m., is covered with the long-leaved pine, which yields a large share of the world's supply of resin, oil of turpentine, raw turpentine, tar and pitch. In 1880 the state contained 6,481,991 acres of improved land, and 15,882,367 acres of other unimproved land. The total number of farms was 157,609, the average size of which was 142 acres. Their cash value was estimated to be $135,793,602; and that of their products, $51,729,611; of farm implements about, $10,124,552. Among the products in 1883 were: Corn, 28,692,200 bush.; wheat, 4,230,800 bush.; rye, 394,274 bush.; oats, 5,142,000 bush.; barley, 2,677 bush.; buckwheat, 49,036 bush.; potatoes, 1,312,935 bush.; tobacco (including smoking and plug), 29,048,213 lbs.; hay, 96,434 tons; cotton, 469,600 bales. Rice, honey, flax, butter, wine, and wool are largely produced, and silk, cane sugar and maple molasses to some extent; 83 of the 96 counties produce cotton, the largest yield being in Wake co., which, before the war, raised almost none.

The leading manufacturing industries are the sawing of lumber and the production of resin, tar, pitch, turpentine oil, cotton-seed oil, tobacco, flour, and the smelting of ores. In 1880 there were 3,802 manufacturing establishments in the state, employing 18,109 hands, and using $13,045,649 in capital, raw material valued at $13,090,937, and producing goods worth $20,084,237. Among these establishments were tar and turpentine works; flouring and grist mills; saw-mills; 80 cotton-mills; tobacco factories; zinc smelting and rolling works; and carriage and wagon factories. The state has four U. S. customs districts—Albemarle, Beaufort, Pamlico, and Wilmington; and it exports, coastwise and to foreign countries, large quantities of tar, turpentine, and resin, lumber, cotton, tobacco, flour, and fish. In 1882 the shipments from Wilmington were: Tar, 72,654 barrels; resin, 476,367 barrels; crude turpentine, 72,070 barrels; spts. turpentine, 88,669 casks; lumber, 31,217,061 ft.; peanuts, 58,885 bush.; total value, exports, $10,000,000. The fisheries of North Carolina are more important than any others on the southern coast, the annual catch amounting usually to 100,000 barrels. The kinds caught are chiefly the alewife herring, shad, bluefish, mullet, and rock.

The number of railroads lying wholly or partly in the state in 1884 was 39, and the number of miles of road in operation 1,820. The most important of these roads are the North Carolina railroad, 223 m. long; the western North Carolina, 210 m.; the Wilmington and Weldon, with a branch running from Tarboro to Rocky Mount, 199 m.; the Atlantic and North Carolina, 95 m.; the Raleigh and Gaston, 97 m.; Carolina Central, 242 m. The Dismal Swamp canal, lying in North Carolina and Virginia, affords communication between Albemarle sound and Chesapeake bay. The number of national banks in the state in 1884 was 15, having an aggregate capital of $2,401,000, and an outstanding circulation, secured by U. S. bonds, of $1,316,235. There were, in '82, 11 state banks and trust companies with a capital of $566,026; and 4 private banks, whose capital amounted to $58,333.

Financially, the state has never been a very satisfactory condition since the war. The ante-war debt in 1874 amounted to $8,878,200, but several railroad operations, together with other liabilities incurred by the state, brought up the aggregate indebtedness that year to $38,921,848, of which about $10,000,000 was for due and unpaid interest. In 1879, however, the state treasurer reported to the legislature that the total amount of the debt, principal and interest, was $27,120,227. This legislature passed an act "to compromise, commute, and settle." On bonds issued before the war (except for the North Carolina railroad) it proposed to pay 40 per cent. of the principal. Other bonds were made redeemable at 25 per cent., and some even at 15 per cent. of the principal. The settlement determined upon was to give, in exchange for the outstanding bonds, new thirty-year coupon bonds, dated July 1, 1880, bearing 4 per cent. interest, payable annually. The total value of these was $3,615,511; amount issued up to Dec. 1, 1884, $2,803,796; outstanding bonds of old issue remaining, Dec. 1, 1884, $2,990,600. In 1884, the total property of the state, real and personal, was assessed at $167,738,639. The state tax is 1 mill on the dollar.

A fund for the support of common schools was created by the legislature in 1825, and certain stocks, owned by the state, in banks and navigation companies, with all moneys paid into the public treasury for entries of swamp and other vacant lands, were set aside to meet this need. During the next fifteen years the fund was enlarged in various ways until, in 1840, it amounted to $2,000,000. This was destroyed, however, by the war, and the new constitution of 1868 provided that 75 per cent. of the entire state and county capitation tax, together with the revenue derived from certain fines, forfeitures, and penalties, should be devoted to school purposes. In 1881–82 the available state fund was $99,250; the receipts for schools, over $433,000; expenditures, over $500,000. There is a compulsory-education law. A state superintendent, assisted by county commissioners and district committees, has control and supervision of the system. In 1880, the number of children in the state between the ages of 6 and 21 attending school was 256,422, of whom 95,160 were colored. There were 605,244 native white persons in the state unable to write. In 1882, however, the report was not as favorable, the number of white pupils attending school during that year having been 144,835, and of colored, 88,236. There was, however, a gain in schoolhouses, in the number of teachers, and in the value of school property, which was $367,671. Substantial aid is received also from the Peabody educational fund, which maintains, during ten months of the year, from 20 to 30 graded schools, each having from 100 to 500 pupils. Besides these public school advantages the state has nine colleges. Among them are the North Carolina university at Chapel Hill, chartered in 1793; North Carolina college (Lutheran), at Mt. Pleasant; Wake Forest college (Baptist), Forestville; Rutherford college (unsectarian), at Excelsior; Trinity college (Methodist). at Trinity; Davidson college (Presbyterian), at Davidson; and Shaw university (Baptist, for colored students, male and female), at Raleigh. Several of these colleges have preparatory, theological, scientific, and other special courses; and there are within the state many academies and seminaries of respectable rank. There were in 1882, five high schools for boys; 10 graded schools established and five projected; 10 state normal schools, five of them for colored teachers; one kindergarten. Teachers' institutes are held in many counties, and three or four educational journals published. The newspapers and periodicals published amount to about 142, there being 13 daily papers, 113 weeklies, 7 monthlies, etc. The denominations represented were: Baptist, Christian, Congregational, Protestant Episcopal, Friends, Jewish, Lutheran, Methodist, Moravian, Presbyterian, German reformed, Roman Catholic, Universalist. By the state laws, defendants and their wives are allowed to testify in criminal actions. In 1881, a majority of about 120,000, one-fourth of whom were said to be colored, voted against a prohibitory liquor law.

The constitution of North Carolina, framed and adopted in 1868, declares that the state shall ever remain a member of the American union, and that there is no right on the part of the state to secede; that every citizen owes paramount allegiance to the constitution and government of the United States; that the state shall never assume or pay any debt incurred in aid of insurrection against the United States; and that no property qualification shall be required as a condition of voting or holding office. The executive power is vested in a governor, lieutenant-governor, secretary of state, auditor, treasurer, superintendent of public works, superintendent of instruction, and an attorney-general, all of whom are elected every four years. The legislature consists of a senate of 50 members, and a house of representatives of 120 members, who are elected every two years. The judicial power is vested in a supreme court consisting of a chief-justice and two associates, a superior court with one judge in each of the 9 judicial districts into which the state is divided. and courts of justices of the peace. The right to vote is conferred upon every male citizen 21 years of age, who shall have resided in the state 1 year and the county 30 days previous to election. Atheists are disqualified for office, and also all persons who have been convicted of treason, perjury, or other infamous crimes, and not legally restored to the rights of citizenship. Under the apportionment of 1882 the state is entitled to 11 representatives in congress, and 11 electoral votes. The electoral votes have been cast as follows: 1792, Washington and Clinton, 12; 1796, Adams and Pinckney, 12; 1800, Jefferson and Burr, 12; 1804, Jefferson and Clinton, 14; 1808, Madison,

for president, 11; 1812, Madison and Gerry, 15; 1816, Monroe and Tompkins, 15; 1820, Monroe and Tompkins, 15; 1824, Jackson and Calhoun, 15; 1828, Jackson and Calhoun, 15; 1832, Jackson and Van Buren, 15; 1836, Van Buren and Johnson, 15; 1840, Harrison and Tyler, 15; 1844, Clay and Frelinghuysen, 11; 1848, Taylor and Fillmore, 11; 1852, Pierce and King, 10; 1856, Buchanan and Breckenridge, 10; 1860, Breckenridge and Lane, 10; 1868, Grant and Colfax, 9; 1872, Grant and Wilson, 10; 1876, Tilden and Hendricks, 10; 1880, Hancock and English, 10; 1884 Cleveland and Hendricks, 11.

NORTHCOTE, Sir STAFFORD HENRY, b. London, 1818; educated at Eton, and Oxford university, graduating at Balliol college in 1839 with high honors. His first position in political life was that of private secretary to Mr. Gladstone, when the latter was president of the board of trade. In 1847 he was called to the bar and was made legal secretary to the board of trade. In 1851 he succeeded to the family title and estates as eighth baronet of the line. For the next three years he was occupied in examining the state of the English civil service, and the report made by him and his colleague sir C. E. Trevelyan, led to the establishment of the present system of competitive examinations. He was member of parliament from Dudley and Stamford from 1855–66, and was then returned from North Devon, which place he has since represented in the interest of the conservative party. He was president of the board of trade (1866–67), and in 1867 was made secretary of state for India. He was appointed a member of the joint high commission which signed the treaty of Washington on May 8, 1871. On the formation of Disraeli's cabinet in 1874, sir Stafford Northcote was made chancellor of the exchequer, and when his leader was elevated to the peerage under the title of lord Beaconsfield, Northcote became himself the leader of the house. He is a magistrate and deputy-lieut. of Devonshire, a fellow of the royal society, and has received from Oxford the honorary title of D.C.L. He has published a number of political and financial pamphlets such as *Twenty Years of Financial Policy, Summary of the chief financial measures passed between* 1842 *and* 1861, *with a table of Budgets* (London, 1862).

NORTH-EAST AND NORTH-WEST PASSAGES. The numerous and important discoveries made by the Portuguese and Spaniards in the southern latitudes of Asia, and the reports which on their return they spread of the fabulous wealth of those regions, excited the attention of the other maritime nations of Europe, and prompted them to send out expeditions to the East Indies for the purpose of obtaining a share in the lucrative traffic of which Spain had hitherto possessed the monopoly. But the latter power, then at the height of her prosperity, was not disposed to admit other nations as sharers of her good fortune, and dealt so summarily with all intruders, having at that time the complete command of the Atlantic and Indian oceans, that her rivals were reluctantly compelled to abandon all thoughts of trading in those seas. Unwilling, however, to lay aside their designs of opening a trade with the far-famed India and Cathay (as China was then called), they resolved to attempt to reach those regions by some other route. Two plans appeared most feasible—the one to reach Eastern Asia by coasting along the north of Europe and Asia, the *north-east passage;* the other by sailing westward across the Atlantic. The latter was first attempted by John Cabot in 1497, but he found his progress barred by the American continent, or, at least, those parts of it known as Newfoundland and Labrador. Three years afterward Gaspard Cortereal and his brother made three several voyages in the same direction; and on reaching Newfoundland sailed northward, but were stopped on the coast of Labrador, in lat. 60° n. Both brothers afterward perished with all their followers. Several voyages were soon after made to discover if a passage for ships existed to the n. of America (the *north-west passage*), but without success; and the hardships which navigators were subjected to in these inhospitable climes, caused the abandonment for the time of all further investigations in that direction.

North-East Passage.—The search for a north-east passage was now vigorously prosecuted, and England had the honor of sending out the first expedition for this purpose in 1553. It consisted of three ships, commanded by sir Hugh Willoughby, and was fitted out under the direction of the celebrated Sebastian Cabot; but on rounding the North cape, one of the ships was separated from the others during a violent storm, and subsequently entered the White sea, then unknown to western Europeans. The other two. under Willoughby, drifted hither and thither, in the vast waste of water surrounding the pole, till the navigators sighted Nova Zembla. Being unable to land, they sailed back along the north of Russia, and took up their winter quarters on the coast of Russian Lapland, where they were subsequently found frozen to death. Several other expeditions were, at different times, sent out by the English and Dutch, but none of them ever succeeded in penetrating further than the e. coast of Nova Zembla, though they rendered good service to geography by making accurate surveys of Northern Europe and the adjacent islands of Spitzbergen, Nova Zembla, Waygatz, etc. It was for a long time believed that the promontory which forms the eastern boundary of the gulf of Obi was the *tabis* of Pliny, and formed the n.e. corner of Asia; and this opinion, which received the assent of the celebrated Gerard Mercator, tended greatly to encourage renewed explorations, as, according to it, the eastern coast of Asia was not more than 400 m. from Nova Zembla. The following is a list of the chief expeditions for the discovery of the north-east passage:

Willoughby and Chancelor	English,	1553
Burroughs	"	1556
Pet and Jackman	"	1580
Barentz, William (three expeditions)	Dutch,	1594–1596
Hudson, Henry — first expedition	English,	1608
Hudson, Henry — second expedition	Dutch,	1609
Wood	"	1676

In his third expedition Barentz nearly reached Icy cape, about long. 100° e. but was, with his crew, imprisoned by the ice, and died before the return of spring. Various important discoveries were made during this expedition, which proved that in favorable seasons a passage could be found to the eastward, but after the subsequent failures of Hudson and Wood, the attempt was abandoned in despair. The Russian government now took up the search, and both by overland expeditions, and by vessels starting from various points on the n. and e. coasts of Siberia, sought to discover a practicable passage. The chief of these expeditions were those of Behring in 1741, which started from Petropaulovski, and was stopped at the East cape; of Shalaroff; and of Billings. In 1875, and again in 1876, Prof. Nordenskiöld reached the eastern shores of the gulf of Obi; and in July, 1878, a well-equipped Swedish expedition, under that veteran explorer attempted once more the n.e. passage. The party successfully rounded cape Chelyu-skin, and in September were able to start from the mouths of the Lena from Behring's strait.

North-West Passage.—As was formerly mentioned, Sebastian Cabot and the brothers Cortereal were the first who attempted to double the n. coast of America; Cabot had reached as far n. as lat. 67° 30′, in the strait between Greenland and America, but the courage of his crew failing, he was compelled to return. Notwithstanding his urgent representations, he was unable to prevail upon the English monarch to send out another expedition, and it was not till after several unsuccessful attempts had been made to find a n.e. passage that investigations of the n. coast of America were resumed. As these investigations were carried on till within the last few years solely by the English, their prosecution till a definite result was arrived at came to be looked upon as a point of national honor, and repeated expeditions were sent out long after it had been clearly shown that a n.w. passage, when found, would be useless in a mercantile point of view. In all, more than 200 voyages were made in search of a n.w. passage, so that only the most important of them can be even mentioned. The first expedition, after that of Cabot, was sent out in 1576, under Martin Frobisher, who made a second and third voyage in the two following years, but without any important discovery. In 1585–88 northern enterprise received an impetus from the successful expeditions of capt. John Davis. This navigator sailed up the strait which bears his name, as far at lat. 72° n., and reported open sea still further n.; he then surveyed the e. and w. sides of the strait, but without further results. Henry Hudson (q.v.), who had previously attempted the n.e. passage, followed in 1610, and discovered the Hudson strait and bay, believing the latter to be none other than an inlet of the Pacific ocean, an opinion which was proved erroneous by the investigations of Button in 1612; the latter, however, disseminated on his return the equally erroneous opinion that the bay was closed in on all sides, with the exception of the two eastern entrances. Button's account was not universally credited, and accordingly, in 1615, capt. Bylot, who had been one of Hudson's company, was sent out, accompanied by Baffin, the most skillful navigator and scientific observer of the time; but their first expedition, which was to Hudson's bay, was devoid of results. In their next voyage (1616), they sailed up Davis's strait, reaching lat. 78° n., and satisfying themselves by a very superficial investigation that their was no northern outlet, the bay (as it was then believed to be) was named in honor of its explorer Baffin's bay. On their return southwards, they coasted along the w. side, and discovered an opening to the w. which they named Lancaster sound, but believing it to be only an inlet, did not explore further. On his return, Baffin gave it as his decided opinion that no outlet to the w. existed from Baffin's bay, and the attention of explorers was again directed to discover an outlet from Hudson's bay. In 1619 the solitary attempt by foreign powers to aid in the search was undertaken by Jens Munk, a Dane, but he made no discoveries, and the attempt was not renewed. The expedition of Fox and James, in 1631, led to the partial exploration of the channel since known as the Fox channel, which forms the northern outlet to Hudson's bay, and from this time the spirit of discovery slumbered till 1741. Between this date and 1746, several expeditions were sent out to discover an outlet from the n.w. corner of Hudson's bay, but their united researches satisfactorily proved that no such outlet existed. Owing to these disappointments, the search for a n.w. passage was discontinued for more than half a century, notwithstanding the fact of the British parliament having promised a reward of £20,000 to the fortunate discoverer. In 1818 the admiralty took up the search; and sent out capt. John Ross and lieut. Parry, who sailed up Davis's strait, and ascended Lancaster sound for 30 m.; here capt. Ross gave up the search, considering it to be hopeless. But this opinion was by no means coincided in by Parry, who was accordingly sent out in the following year, and succeeded in far outstripping all his predecessors in the career of northern discovery. He entered Lancaster sound on July 30, and a few days afterward discovered a large inlet, 30 m. broad, which he named Prince Regent inlet. After exploring this inlet for some distance, he returned, and continued his course westward, as the ice allowed him, passing

through a strait which he named after sir John Barrow, the promoter of the expedition. Continuing his westward course, he reached long. 110° w., in Melville sound, where he was stopped by the ice; and after wintering here, and giving names to the numerous islands, seas, and straits he had discovered, returned to Britain, with the glory of having advanced 30° of longitude further w. than any previous explorer. On his arrival he was welcomed with the utmost enthusiasm, and his discoveries imparted renewed energy to the half-dormant maritime enterprise of the British. There was now no doubt in what direction the n.w. passage was to be sought, but Parry's second expedition (1821–23) was for the purpose of determining whether the Fox channel was connected with the Arctic sea of his previous voyage; it was, however, unsuccessful. A little before this time the coast-line of North America from Behring's strait to point Turnagain, in long. 109° w., had been fully traced, so that it only remained to find some navigable passage from Regent inlet to this point, and the long-wished-for result would be attained. For this purpose capt. John Ross was sent out with an expedition in 1829, and after a laborious and difficult voyage up Prince Regent inlet, reached a point only 200 m. from point Turnagain. It was during this voyage that he discovered the magnetic pole. Dease and Simpson, in 1838, extended the survey of the American coast from point Turnagain to within 90 m. of the magnetic pole, but the hopes of a channel between these points were dashed by the discovery made by Dr. John Rae, in 1847, that Boothia (the land which bounds Regent inlet on the w.) is a peninsula of the American continent. We now come to the unfortunate expedition of sir John Franklin, which, it was fondly hoped, would settle the question of a n.w. passage. It sailed from England, May 19, 1845, and was last seen in Baffin's bay. Franklin is believed to have sailed through Lancaster sound, and ascended Wellington channel to lat. 77° n., and thence returned southwards, crossing Barrow strait, and sailing down the channel (now called Franklin channel) which separates North Somerset and Boothia Felix from Prince of Wales island to the w., where, in lat. 70° n., long 98° 30′ w,, his ships were beset with ice, Sept. 12, 1846, and Franklin died June 11, 1847. The survivors abandoned the vessels 20 m. s.w. of this point, and perished in the attempt to reach the American mainland. Many expeditions were sent out to search for the missing voyagers, and one of these expeditions, under Collinson and M'Clure, sailed from Plymouth, Jan. 20, 1850, and reached Behring's strait in August the same year. Sailing eastward the following spring, M'Clure's ship became fixed in the ice, about 60 m. w. of Barrow strait, and the crew were picked up by sir Edward Belcher, who had been sent out in April 1852 to their assistance. Belcher, who had reached Melville sound by the eastern passage through Lancaster sound and Barrow strait, returned the same way; and thus M'Clure and his company enjoyed the envied honor of being the only ship's crew who had ever penetrated from Behring's strait to Baffin's bay. To M'Clure, then, belongs the honor of having finally set at rest all doubts as to the existence of a n.w. passage. By the various English and American expeditions (1848–59) sent out to search for sir John Franklin, the whole region to the n. of the American mainland as far as lat. 77° n., and long. 106° w., has been thoroughly explored, and various channels of communication between Davis's and Behring's straits have been discovered, such as the route by Hudson's bay, Fox channel, Fury and Hecla strait and Bellot strait, into Franklin channel, and thence by either the M'Clintock or the Victoria channel, or the routes by Lancaster sound, and the M'Clintock channel, Prince Regent inlet, or Prince of Wales strait, to the open sea n. of Alaska, but all these routes are useless in a mercantile point of view. See Polar Expeditions.

NORTHERN LIGHT-HOUSES, Commissioners of. The body corporate which has under its mangagement the whole of the light houses of Scotland and isle of Man. The body was first constituted by act of parliament 26 Geo. III., but has been frequently since the subject of legislation. The light-houses of the isle of Man were assigned to it in 1815. By the Merchant shipping act, 1854, the commissioners are so far limited in their power, that any proposal for a new light-house must receive the approval of the Trinity house, London, and the outlay must be sanctioned by the board of trade; the cost, however, is borne by the imperial light-house fund. The commissioners act wholly in virtue of office, and give their services gratuitously. The body consists of the lord advocate, solicitor-general, lord provost and senior bailie of Edinburgh; lord provost and senior bailie of Glasgow; lord provost of Aberdeen; provosts of Inverness, Campbelton, Dundee and Greenock; the sheriffs of the following counties: Aberdeen, Argyle, Ayr, Berwick, Bute, Caithness and Sutherland, Edinburgh, Elgin, Fife, Forfar, Haddington, Inverness, Kincardine, Lanark, Orkney and Shetland, Renfrew, Ross, Wigtown, and Kirkcudbright. The business of the commissioners is conducted at an office in Edinburgh, with the assistance of a secretary and consulting engineers. In 1877 the number of light-houses under the charge of the commission was 60, beside buoys and beacons. The commissioners own a steam vessel, the *Pharos*, for supplying stores to the several light-houses, and performing annual visits of inspection. The whole system of northern lights is remarkably well organized, the merit of which is in a great measure due to the late Robert Stevenson (q.v.). A royal commission appointed some years ago to inquire into the management of the English, Irish and Scottish light-houses, has acknowledged that the "Scotch light-houses are in the best state of general efficiency, the English next, and the Irish third."

NORTHERN LIGHTS. See AURORA BOREALIS, *ante.*

NORTH HOLLAND CANAL. Designed by Herr Blanken, and finished in 1825. It runs from Amsterdam to the Helder, 50 m., and has a water-level width of 123½ ft., with a depth of 18½, and a bottom width of 31. It enables vessels trading from Amsterdam to avoid the island, and sand-banks of the dangerous Zuyder Zee, the passage through which once took as many weeks as it now does hours. The greatest difficulties in the way of the work were the proverbial lowness of the country, and the necessity of preventing the assaults and encroachments of the sea. The level is such that vessels are locked *down* from the sea to the canal.

NORTH HUNTINGDON: a tp. in Westmoreland co., Penn. Pop. '80, 6,341.

NORTH RIVER: a magisterial dist., Augusta co., Va. Pop. '80, 4,313.

NORTH RIVER. See HUDSON RIVER.

NORTHROP, BIRDSEY GRANT, b. Conn. in 1817; took the degrees of B.A. (1841), M.A. from Yale, and studied at the Yale divinity school. He settled as pastor at Saxonville, Mass., where he remained about ten years. From 1857 to 1866 he was agent of the Massachusetts board of education, and in 1869 became secretary of the state board of education of Connecticut, a position which he held till 1882. He has published a number of papers on the subject of education, and has also done much to encourage the beautifying of country towns by planting shade trees.

NORTHROP, HENRY PINCKNEY, D.D. See page 890.

NORTH SEA (*Germanicum Mare;* Ger. *Nord See*), that arm of the Atlantic ocean which separates the British islands on the w. from the continent on the east. It is 700 m. in extreme length (from n. to s.), about 400 m, in greatest breadth, and has an area of not less than 140,000 sq. miles The great commercial highways from the North sea to the Atlantic are by the Pentland firth and the strait of Dover; while on the e. it communicates with the Baltic by the Skagerrack, the Cattegat, Sound, and Great and Little Belts. Along its south-eastern and southern coasts the shores are low, and are skirted by sand-banks, formed by the sand deposits carried to the sea by the waters of the Elbe, Weser, Rhine and Scheldt, which are the principal rivers that flow into the sea from the east. The shores of England, especially in the s., are also low, and here sand has also accumulated, though not nearly to the same extent as on the continental coasts. The chief British rivers that fall into the North sea are the Thames, Ouse, Humber, Tyne, Tweed, Forth, and Tay. Besides the sand-banks on the coast already referred to, there are others extending to the middle of the sea-bed, and similar in their origin to those on the coasts, and occupying altogether about three-fourths of the entire area. Of these, the principal are the bank running n.e. from the mouth of the firth of Forth for 110 m.; the one extending n.w. from the mouth of the Elbe for about the same distance; the Dogger-bank (q.v.), etc. These sand-banks, combined with the storms and fogs so common in the North sea, render its navigation unusually dangerous. Another peculiarity of the bed of this sea is, the number of extraordinary "holes" which have been found in it. Of these the most remarkable are the Little Silver Pitt off Holderness in Yorkshire, and the North-north-east Hole, 8 leagues further east. Little Silver Pitt is 25 m. in length, and from half a mile to 2 m. in width. At its edges there is a depth from 50 to 80 ft. of water, but the "hole" has a depth of 330 feet. In the n., along the Norwegian coasts, the shores are steep and rocky, and there is a depth of about 190 fathoms. The depth (31 fathoms on an average) increases from s. to north. The currents of this ocean are extremely various, and demand the greatest caution on the part of the navigator. Owing to the prevalence of s.w. winds, the currents show a general tendency towards the north-east. On the south-western coast of Ireland, the great tidal wave of the Atlantic is broken into two portions, one of which, coursing up the channel, passes through the strait of Dover; while the other, sweeping n., passes round the n. of Scotland, and then southward along the e. coast of Britain, and meets the southern wave off the coast of Essex. The northern portion of the tidal wave spreads over the whole of the German ocean, and though on its entrance into the North sea it is only 12 ft. in height, it rises in its progress southward, as the sea becomes narrower, in the same way as the *bore* (q.v.) is formed in a contracting estuary. In the estuary of the Humber it rises to the height of 20 feet. This sea yields immense quantities of fish, the most important kinds being cod, hake, ling, turbot, sole, mackerel and herring, also lobsters. The fisheries employ many thousand people. On all available points of the coasts, light-houses have been erected, and there are numerous floating-light vessels moored to detached banks. The traffic on the North sea is enormous. It is surrounded by countries whose inhabitants have from the earliest times been famous on the seas, and whose vast commercial enterprise is but another form of the early Scandinavian love for navigation and conquest.

NORTH SEA CANAL, or AMSTERDAM CANAL. The rapid increase of the trade of the ports to the southward and eastward of the Helder made it imperative for the merchants of Amsterdam to provide better communication with the North sea than that afforded by the north Holland canal already noticed. In 1865 a company was formed to construct a canal nearly in a direct line to the North sea from Amsterdam, through lake Y and Wyker Meer, 16½ miles. Mr. Hawkshaw and Herr Dicks were appointed engineers. The canal terminates in the North sea, in an artificial harbor, inclosed by two piers of concrete on a foundation of rough basalt. Each is 5,069 ft. long, and the area inclosed is about 260 acres. A cutting 3 m. in length through the sand-dunes follows,

involving the excavation of 6,213,000 cubic yards. Between Wyker Meer and lake Y another cutting 327,000 cubic yds. occurs. There is a set of locks at each end, and the average section of the canal is: water-level, 197 ft.; bottom, 89 ft.; depth, 23 feet. The cuttings were first made, and the material was deposited in two banks, 443 ft. apart, through the lakes, the total length of bank being 38½ miles. These enable about 12,000 acres, once covered by water, to be reclaimed, and for this purpose there were set up three Appold pumps, the largest ever made, the fans being 9 ft. in diameter, maximum lift 9 ft. 9 in.; at the ordinary working lift, the three discharge 2,700 tons a minute. Visitors to the American exposition of 1876 will remember the splendid set of drawings and pictures of this canal, the most gigantic work of the kind yet undertaken. The contract sum was originally over $12,000,000.

NORTHUMBERLAND, a co. in e. central Pennsylvania, bounded on the w. by the Susquehanna river and its w. branch; drained by them and the n. branch of Susquehanna, and by Shamokin and Mahonoy creeks; on the Delaware, Lackawanna, and Western, Northern Central, Sunbury, Hazleton, and Wilkesbarre, and Sunbury and Lewistown railroads; 490 sq.m.; pop. '80, 53,123—48,364 of American birth. The surface is irregular and hilly, with fertile valleys between. The principal productions are Indian corn, oats, wheat, buckwheat, potatoes, and hay. There are many tanneries, currier's shops, saw, flour, and planing mills, manufactories of machinery, metal wares, clothing, carriages, and harness. Co. seat, Sunbury.

NORTHUMBERLAND, a co. in e. Virginia, bounded on the e. by Chesapeake bay, and on the n.e. by the mouth of the Potomac river; 200 sq.m.; pop. '80, 7,927—7,907 of American birth; 3,484 colored. The surface is undulating and heavily wooded in parts, and much of the soil fertile. The principal productions are Indian corn, wheat, oats, potatoes, and sweet potatoes, wool, and sorghum molasses. Co. seat, Heathsville.

NORTHUMBERLAND, the most northern co. of England, is bounded on the e. by the North sea, and on the n.w. by the Scottish counties of Roxburgh and Berwick. Area, 1,290,312 statute acres; pop. '81, 434,086. The surface of the county has a rugged, and especially in the w. and s.w. a naked and barren aspect. The Cheviots run along the western border of the county, and send out spurs toward the e., which, gradually declining, are separated by fertile valleys, that widen as they approach the coast. About one-third of the area of the county is occupied by moorland, and along the Cumberland border the broken and bleak-looking hills are valuable for their lead mines. Allenheads, the center of the lead mining district, is the highest inhabited spot in England, being 1400 ft. above sea-level. The inclination of the surface toward the e. is indicated by the direction of the rivers Alne, Coquet, and north Tyne, which with the Tyne and Till are the principal rivers of the county. The Tweed forms the boundary of the county on the n. for about 5 miles, and the s. boundary is formed in part by the Derwent and Tyne. The climate is cold, but is milder on the coast than amid the hills, which, however, produce sufficient herbage for the maintenance of large flocks of "Cheviot" sheep. The principal agricultural tracts occur along the coast, and inland along the river valleys for several miles. In these districts, the soil, for the most part, is a strong fertile clayey loam, productive in wheat, barley, beans, and clover. Agriculture is pursued on the most improved methods, and cattle, chiefly short-horned, are extensively reared. The s.e. portion of the county forms a part of the great Northumberland and Durham coal-field, which produces about 25,000,000 tons annually. There are upwards of 100 pits in operation in the county. Northumberland is traversed by the Newcastle and Carlisle, North-Eastern and Border Counties railways. The county returns four members to the house of commons; the county town is Alnwick (q.v.).

NORTHUMBERLAND, a co. in n.e. New Brunswick, on the gulf of St. Lawrence, drained by the Miramichi river and its branches; 4,760 sq.m.; pop. '81, 25,109. Co. seat, Newcastle.

NORTHUMBERLAND, a co. in Ontario, Can., bounded on the s. by lake Ontario, intersected by the Grand Trunk, and Cobourg, Peterborough, and Marmora railroads; 745 sq.m.; pop. '81, 39,283. Co. seat, Cobourg.

NORTHUMBERLAND, Dukes of. See Percy, *ante*.

NORTHUMBRIA, a kingdom in the Saxon heptarchy, made a separate kingdom by Ida in 547, who united the two kingdoms of Bernicia and Deira. It stretched to the firth of Forth, and comprised the territory n. of the Humber. Again divided upon Ida's death, it was once more organized into one kingdom by Ethelfrith in 593. Under Oswald, in the middle of the 7th c., it was the strongest kingdom in the heptarchy. Its separate existence was brought to an end by Egbert in 827. The name survives in the modern county of Northumberland.

NORTH WALSHAM, a small market t. of England, in the co. of Norfolk, on an acclivity on the right bank of the Ant, 14 m. n.n.e. of Norwich, Its market-cross, repaired after the great fire in 1600, by which the town was almost entirely burned down, dates from the reign of Edward III. Pop. '81, 3,233.

NORTH-WEST PROVINCES, a great political division of British India (see India), between Nepaul and Oude on the n.e., and Rajpootana and the Indore agency on the s.w., consisting of seven subordinate divisions—Meerut, Kumaon, Rohilcund, Agra, Jhansi,

Allahabad, and Benares. Each of these divisions comprises from three to six districts. They are treated under separate articles. The area of the North-West Provinces is 81,403 sq.m., and the pop. in '81, amounted to 741,750. The capital is Allahabad.

NORTHWESTERN UNIVERSITY, at Evanston, Ill., a Methodist university chartered in 1851, but not fully organized until several years later. The endowment is in real estate of uncertain value, but is estimated at $800,000: annual income, $40,000. The university grounds are on the shore of lake Michigan, and, together with the buildings, are valued at 300,000. The principal buildings are university hall, containing the chapel, library, museum and recitation rooms; Heck hall, used by the theological department; and the woman's college of literature and art. The university, besides a preparatory school, embraces nine departments, each with a separate faculty as follows: 1. A college of liberal arts, and university matters; 2. woman's college; 3. department of art; 4. school of elocution; 5. Swedish theological seminary; 6. conservatory of music; 7. department of theology, or Garrett Biblical institute; 8. department of law; 9. department of medicine. The library contains 30,000 volumes, and has a fund of $60,000 at interest, to be ultimately used in erecting a fire-proof library building. The Garrett Biblical institute, on the university grounds, has a distinct charter and board of trustees, but sustains a coöperative relation to the university. The museum contains 15,000 specimens. Instructors in all departments (1884), 61; students in all departments, 847. A thorough preparatory school is maintained with a distinct building and faculty. President, Rev. Joseph Cummings, LL.D.

*NORTHWEST TERRITORIES, the designation of all that portion of British North America under the dominion of Canada, except the provinces of Manitoba and British Columbia, lying w. and n. of the provinces of Quebec and Ontario. On the n. it is bounded by the Arctic ocean, on the e. by the Atlantic, on the w. by the Pacific, and on the s. by parts of Canada and the United States. Its length e. and w. is about 2,500 m.; breadth of the mainland n. and s., 1500 m.; and its estimated area, including the islands in the Arctic ocean, about 2,750,000 sq. miles. A great portion of the region consists of inland seas, bays, lakes, rivers, swamps, treeless prairies, and barren hills and hollows. By one explorer it has been not inaptly called "the fag end of the world." In the s.w. the face of the country is level or rolling; farther e. the surface is broken and there are mountains 1000 ft. high; and on the Atlantic coast there are rocks, lakes, swamps, and mountains. The extreme n. is intersected with lakes, marshes, and rivers to a greater extent than any other portions of the globe that have been explored. The country immediately s. and w. of Hudson's bay is generally well wooded and has a fair soil. The principal rivers of the territories are the Churchill, Nelson, Severn, Albany, Abbitibbi, East Main, and Great Whale rivers, flowing into Hudson's bay; the MacKenzie, Coppermine, and Great Fish rivers, flowing into the Arctic ocean; the Saskatchawan, Assinniboin, and Red rivers, falling into lake Winnepeg; and the Caniapuscaw and Natwakame rivers, falling into Hudson's strait. The chief lakes are the Great Bear, Great Slave, Athabasca, Winnepeg, Manitoba, Lake of the Woods, Winnepegoos, Clearwater, Nelson, Deer, Wollaston, North-Lined, Mistassini, and Abbitibbi. The geology of the region is not accurately known; but the western limits of the Hudson's bay basin are believed to be in part marked off by hills of metamorphic rock, and the iron and lignite-bearing beds of Colorado and Wyoming appear to continue northward to the Arctic ocean. About 30 m. s. from this sea copper has been found in small quantities on the Coppermine river. The climate is severe and in the greater portion of the territories agriculture is not practicable. In the n. the land is never thawed more than a few inches even in midsummer, and from the middle of October to the middle of May the country is buried under snow, while the smaller rivers and lakes are frozen to the bottom. In the w., however, the temperature is somewhat higher, and in the s. very variable, the range being 140°. A region commencing at the 100th meridian and 49th parallel and extending n.w. to the 52d parallel and 113th meridian embraces about 50,000 sq.m. that has a prairie hay which preserves its flavor and nutritive properties throughout the winter and provides the herds of buffalo with food. Here and there along the principal rivers and around the larger lakes are tracts capable of cultivation. The best of these localities are the valley of the Peace river, the district along the upper waters of the Athabasca and the upper valley of the Saskatchawan. Of the wild animals that are found the buffalo, beavers, sables, martens, wolves, foxes, bears, and others are very numerous, making the territories the most important fur-producing portion of the world. The musk-ox and some species of deer are also abundant, and the seal and walrus are found on the shore of the Arctic ocean. The principal rivers and lakes are well-stocked with fish, including perch, carp, pike, whitefish, and sturgeon.

The history of this immense region dates back to 1610 when Hudson's bay was discovered by John Hudson, an English navigator. Sixty years later Charles II. granted a great tract within its limits to prince Rupert, the duke of Albemarle, and others, who organized the Hudson's bay company to carry on the fur trade. This tract by the original charter was called "Rupert's land;" and it constituted one of the king's colonies or plantations in America and was defined as all the lands and territories upon the countries, coasts, and confines of the seas, bays, lakes, rivers, and sounds, in whatsoever latitude they might be, that lay within the Hudson's straits, and that were not already

possessed by the subjects of any other kingdom. Up to 1870 the whole region was known as the Hudson's Bay territory and was governed by the Hudson's Bay company, by whom it was divided into four large departments or regions which were subdivided into 33 districts, including 155 trading posts. The government was administered by a chief governor and council, and the various departments by chief factors and traders. But in 1869 the company relinquished governmental functions, and during the following year the Northwest Territories came into the possession of Canada and were made a province. The scanty population is mostly Indian or half-breeds, and the various tribes together are believed to number about 60,000 persons. They subsist by hunting, trapping, and fishing. The white inhabitants, scattered at the various posts of the Hudson's Bay company, and employed by the company are mostly Scotch and French Canadians, and number about 3,000. There are numerous Roman Catholic, a number of Anglican, and a few Methodist and Presbyterian missions among the Indians, many of whom have become civilized and embraced the Christian religion. The most important settlement is York Factory, on Hudson's bay near the mouth of the Nelson river, communication is had in the winter season between this place and fort Garry in Manitoba, the headquarters of the Hudson's Bay company in America, by means of dog sledges, and in summer by means of canoes and boats on the streams. The government of the territories is vested in a lieut.gov. and a council of not more than five members, appointed by the gov.gen. of Canada in council. As soon, however, as any district of not more than 1000 sq.m. contains 1000 adult inhabitants, it is entitled to elect a member of the council for two years, and a second member when the inhabitants number 2,000. The seat of government is Battleford, a town situated at the junction of Battle river with the north fork of the Saskatchawan, and on the Canadian Pacific railroad, about 500 m. w.n.w. of Winnepeg. See *Supp.*, page 890.

NORTON, a co. in n.n.w. Kansas, adjoining Nebraska, drained by the n. fork of Solomon river, by Prairie Dog creek, and the tributaries of Republican river; 900 sq.m.; pop. '80, 7,002—6,525 of American birth. The surface is nearly all prairie, and the soil fertile. The principal productions are wheat and Indian corn. Co. seat, Norton.

NORTON, Andrews, Rev., American scholar and theologian, was b. at Hingham, Mass., Dec. 31, 1786. Having graduated at Harvard College in 1804, he was appointed, in 1809, a tutor of Bowdoin college, and in 1811 mathematical tutor at Harvard, and in 1813 librarian of the university, and succeeded Dr. Channing as lecturer on biblical criticism and interpretation. In 1819 he was appointed Dexter professor of sacred literature, which office he retained until failing health compelled his retirement in 1830. Dr. Norton was, after Dr. Channing, the most distinguished exponent of Unitarian theology, a clear and perspicuous lecturer, an able and conservative critic, and a voluminous writer. Rejecting the doctrine of the Trinity, and protesting against Calvinism, he also opposed the school of Theodore Parker and the naturalistic theology. Besides his contributions to the *General Repository and Review*, the *North American Review*, *Christian Examiner*, he published (1833) *A Statement of Reasons for not believing in the Doctrine of the Trinity;* (1737) *The Genuineness of the Gospels;* (1839) *On the Latest Forms of Infidelity;* and left some poems and a translation of the gospels. He died at Newport, R. I., Sept. 18, 1853.

NORTON, the Hon. Caroline Elizabeth Sarah, a poetess and novelist of some reputation, the daughter of Thomas, and the granddaughter of Richard Brinsley Sheridan, was b. in 1808. Her father died while she was still a child, and her education, which embraced an unusually varied course of studies, was superintended by her mother. In 1827, she married the hon. George Chappel Norton. In 1831 she first met lord Melbourne, then prime-minister, and the intimacy which succeeded having given rise to some scandalous rumors, Mr. Norton brought an action against lord Melbourne, which resulted in a verdict for the defendant. She died June 15, 1879, after having been for some months the wife of sir W. Stirling Maxwell. Her chief works are *The Sorrows of Rosalie* (1827); *The Undying One* (1830); *The Child of the Islands* (1845); *Stuart of Dunleath*, a novel (1847); *English Laws for Women in the Nineteenth Century* (1854); *The Lady of Garage* (1862); *Lost and Saved*, a novel (1863); and *Old Sir Douglas* (1868); Her prose works, several of which depict the wrongs incident to the position of women, are written with considerable cleverness and vigor; and her verse, though overstrained and stagy in sentiment, has numerous admirers, and manifests some degree of that brilliancy for which the Sheridans have been so famous.
